

Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

- + *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.
- + *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.
- + *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.
- + *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter <http://books.google.com> durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

BATHS AND LAVATORIES.

"CARRON" BATHS and LAVATORIES have a sound reputation for construction, design, and finish. They embody all the very latest and most up-to-date features, and from a sanitary and hygienic point of view leave nothing to be desired. They are finished in various colourings of metallic, vitreous, and porcelain enamels.

The metal used in their manufacture is taken from Carron Company's own ironfields, and specially selected for the purpose. It is subjected to laboratory analysis, thus preventing those defects which are continually arising through the employment of inferior or unsuitable metal.

The **"CARRON"** selection includes Baths and Lavatories for the Cottage, Mansion, Hotel, or Institution, all of which are the acme of perfection.

Write for No. 18 Bath Catalogue.

Carron Company also manufacture Cooking Ranges, Grates, Cowhouse, Stable, and Piggery Fittings, Gates, and Railings, Cooking Apparatus for Gas, Steam, or Coal, &c., &c., all of which are the recognised standard in their particular line.

Carron Company Carron, Stirlingshire.

A WEEKLY

ILLUSTRATED JOURNAL

OF

ART,

CIVIL ENGINEERING,

AND

BUILDING.

Am I to be told that the "nature" of Attica would be more poetical without the "art" of the Acropolis? Of the Temple of Theseus, and of the still all Greek and glorious monuments of her exquisitely artificial genius? Ask the traveller what strikes him as most poetical—the Parthenon, or the rock on which it stands? The columns of Cape Colonna, or the Cape itself? It is the "art," the columns, the temples which give them their antique and their modern poetry, and not the spots themselves. Without them the spots of earth would be unnoticed and unknown.—LORD BYRON.

VOL. LXXVI.

JULY TO DECEMBER 1906.

LONDON:

PUBLISHED AT IMPERIAL BUILDINGS, LUDGATE CIRCUS, E.C.

THE ARCHITECT AND CONTRACT REPORTER. A JOURNAL OF ART, CIVIL ENGINEERING & BUILDING.

THE WEEK.

ONCE more Messrs. PEARSON, the contractors, have been unlucky in the Irish law courts. We have already described in detail the circumstances of their case. They undertook to construct precipitation tanks and other works in connection with the drainage of Dublin for 94,000*l.* In preparing the tender they were guided by plans prepared for the purpose by the engineers of the Corporation, and on which a harbour wall was represented by dotted lines. As there was no wall the contractors had to perform more work than was contemplated, and they claimed 36,000*l.* in payment. At the first trial the Lord Chief Baron directed that a verdict should be given in favour of the Corporation. Application was made to the King's Bench Division for a new trial, and a majority of the Court decided that judgment should be entered for Messrs. PEARSON with costs. The Corporation appealed, and the hearing occupied several days. Judgment has now been given, and the order of the Lord Chief Baron in favour of the Corporation has been restored. The Lord Chancellor held that dotted lines were to be interpreted as relating to an existing wall, which counsel for the Corporation had denied, and that the original plan could not be carried out. But his Lordship maintained that the specification should be considered with the plans, and in it the contractor was informed that he must act on his own judgment and make his own investigations. Under these circumstances a charge of fraud could not be upheld. Lord Justice FITZGIBBON and Lord Justice HOLMES concurred. As far as the Irish Courts are concerned the litigation may be said to have ended. In the House of Lords a different result might be attained.

THERE was a short discussion at the meeting of the London County Council on Tuesday upon the Greenwich generating station and the Greenwich Observatory. The highways committee reported that no serious interference with the observations had occurred. In order to avoid all risk it was decided that the erection of the chimneys should be suspended for the present. The Admiralty had suggested that a series of tests, extending over a considerable period, should be carried out in order to arrive at a fair estimate of the amount of interference which might be caused by the working of the station to the astronomical instruments at the Observatory. With that object it was proposed that a small committee, consisting of representatives of the Admiralty and of the Council, should be formed to conduct the investigation. The committee recommended that the Lords Commissioners should be informed that the Council would be glad to co-operate in the appointment of such a committee. The recommendation was unanimously adopted, and it was arranged that Sir BENJAMIN BAKER should represent the Council at the inquiry. It is evident that no danger has yet arisen, although absurd allegations were made in newspapers

on the subject. It is only right, for the sake of accuracy in the calculations and observations of the officials at the Observatory, that an investigation should be made into the contingency of infinitesimal probabilities of danger. But at present everything adds assurance to the hope expressed by the chairman of the highways committee, that both the generating station and the Observatory would be at Greenwich a century hence.

THE Board of Management of Henshaw's Blind Asylum, Old Trafford, are desirous to erect a new institution, and they invite designs from architects practising in Manchester. A copy of the plan and instructions can be obtained on payment of a guinea. Manchester is not so large a city as to have many architects who are unknown, at least by repute, to the assessor, Mr. JOHN HOLDEN, if not to the Board. The deposit of a guinea therefore seems unnecessary, and, moreover, it is putting architects on the same footing as builders. Deposits are demanded from builders because it is very easy to assume the title, and men pose as builders and contractors whose experience has been derived from assisting a paperhanger or other tradesman. No doubt it is the custom in municipal works in Manchester and Liverpool to ask competing architects for deposits, which is more honoured in the breach than the observance.

THE amount of money available for the purchase of works for the Irish National Gallery is very limited. According to the report of the director, a portrait of a lady by the Spanish painter, F. GOYA, has been acquired for 600*l.* A chalk study of a nude figure by ALFRED STEVENS cost 17*l.* For a portrait of the late Mr. LECKY, the historian, by Mr. JOHN LAVERY, 100*l.* was paid. A very interesting series of twelve pen and pencil portraits by the late CHARLES GREY, R.H.A., was obtained for the small outlay of 3*l.* The *Dublin University Magazine* imitated *Fraser's Magazine* by publishing portraits of celebrities, and the sketches were made for that purpose. Several engravings of portraits were purchased. Among the gifts were a bronze bust of Mr. LECKY by BOEHM, and a series of sketches by Sir F. W. BURTON, who was director of the National Gallery. One curious incident is mentioned in the report. A miniature portrait of RICHARD BURKE, by BONE, was advertised for sale by auction in Dublin. This miniature having been identified as the one stolen from the National Gallery in 1880, steps were taken through the Law Officers of the Crown for its recovery. The Governors and Guardians having been advised that the recovery of the miniature by legal proceedings would be expensive and by no means certain, consented to purchase it from its holder, a London dealer, for 20*l.*, which was accordingly done. The case suggests the necessity for some arrangement which would not aid thieves who make public galleries and museums their prey.

ST. DAVIDS CATHEDRAL.*

ACCORDING to some archæologists Wales at one time contained several sees. This would not be peculiar if we remember that originally a bishopric was no more than a large parish. In the course of centuries the number was reduced to four—St. Davids, St. Asaph, Llandaff and Bangor. Two are called after bishops. In Ireland the practice of bestowing a saint's name on a district was not uncommon; and there is one instance—St. Andrews—in Scotland, and one now in England—St. Albans. St. KENTIGERN has a better right than St. ASAPH to have his name linked with the see. And it is believed that DUBRECIUS possesses also a prior claim to be associated with the see of St. Davids.

It is now impossible to separate history from legend in the life of St. DAVID. It is doubtful when he was born. It is generally believed, however, that he laboured in the sixth century, some saying that he lived until 601, while others suppose he died in 544. He was the son of a Welsh prince, but was early attracted by monasticism and founded a college or monastery which gained reputation from the number of its missionaries. Afterwards he was made Bishop of Caerleon, but as he considered the place was too near the heathen English he removed his chair to St. Davids. The mention of Caerleon recalls Arthurian legends, and it is related by BROWNE WILLIS that St. DAVID was the uncle of king ARTHUR. Whether he was the first bishop it is now impossible to ascertain.

The position of the building would suggest that it was selected by some prelate who sought after quietude, or, as BYRON said of the founders of Newstead, by those who wished to shield their devotion from the wind. Instead of being placed on a height which would be a beacon to wanderers, the cathedral is in a hollow. We must assume that, as in other places, the site of the earliest church was respected. We can now know nothing about the character of St. DAVID's building. Although it may have been recognised as the metropolitan church of Wales no description of it has survived. In 712 it is related that a cathedral which had been plundered in the preceding century was destroyed by the West Saxons. ASSER, who was the biographer of ALFRED THE GREAT, was a monk of St. Davids. This would show that learning was cultivated in so remote a place in the ninth century.

The Norman invasion brought better order into that part of the country. WILLIAM is said to have visited the shrine of St. DAVID. In 1115 BERNARD, a Norman, was appointed bishop, regardless of the practice of election by the clergy. It was not until the time of Bishop PETER DE LEIA, who reigned from 1177 to 1198, that the present structure was commenced. According to BROWNE WILLIS:—"In the year 1176, when PETER DE LEIA became bishop of the see, the cathedral had been so much ruined by the incursions of the Danes and other pirates that it was thought right to take it down and rebuild it." One important feature—the central tower—fell in 1220, soon after it was erected, crushing choir and transepts. As Professor WILLIS has remarked, there are few central towers of Norman date which have not fallen sooner or later. No tower was restored so injudiciously as this of St. Davids. It continued more or less unstable for six hundred years, and when Sir GILBERT SCOTT reported on it in 1862, the only security it had from falling was the buttressing it sustained from the walls of the transepts and nave.

It will be seen from the illustrations of the cathedral which we shall publish that work was carried on at St. Davids during several periods. Much of it, including the nave, choir and presbytery, may be described as Transitional. The exterior, however, is more suggestive of a Late Decorated character. The north transept is thirteenth-century work. In the fourteenth century HENRY GOWER, the Menevian

WYKEHAM, who was Chancellor of England, was bishop, and he not only built the splendid palace adjoining the cathedral, but carried out many alterations in the interior. To him must be ascribed the rood-loft, which JOHN CARTER described as, without exception, the most perfect work of its class which had survived. Writing in 1804 he said:—"In this charming performance are traced the same mouldings, ornaments, &c., as we were dazzled with in St. Stephen's Chapel, Westminster, before it became the object for unnecessary havoc and dilapidation." In the fifteenth century and early part of the sixteenth the work which had to be executed is of a character which testifies to the skill of the craftsmen, who probably had to be brought from other parts of England.

Sir GILBERT SCOTT was struck by the general effect of the cathedral, although when he was called in a large part of it was in ruins. According to him it did not fall short of contemporary structures in the grandeur of its conception or the beauty and refinement of its details. It lingers, he said, in some degree behind many of them in the extent to which the pointed arch has supplanted the round, but this was probably owing to a desire to avoid undue height rather than to any want of advancement; for in all the details, and especially in the carved foliage, the skill and taste exhibited is of first-rate order, and the execution of the ornamental masonry could hardly be excelled. Its architect, indeed, seemed determined to plant in the furthest extremity of our island the standard of the utmost advancement of his art at the period of its most determined progression. These facts render the building a wonderfully interesting and valuable landmark in architectural history, taking in the extreme west a position parallel to that held by Canterbury in the extreme east of the island. About ten years earlier the cathedral had been described by E. A. FREEMAN, and his opinion is not less favourable to the importance of St. Davids:—

Perhaps there is no church of the same size which exhibits the cathedral type so thoroughly developed in every respect, except one which has no influence on its external appearance. In point of complication of ground-plan it ranks with—perhaps surpasses—Winchester and St. Albans; and the profusion of chapels and surrounding buildings has the advantage of restoring that varied and picturesque effect which might otherwise have been lost by the absence of any high-pitched roof. Besides the ordinary parts of a cruciform church, a succession of three chapels of inferior height is added to the east end of the choir and the aisles of the latter are continued along them during a great portion of their extent. To the east face of the north transept is attached a lofty building of three stages, containing the chapter-house and other apartments. This erection, which is, excepting of course the tower, the highest portion of the whole pile, naturally forms the most prominent feature in the eastern view, and imparts much variety and singularity to the outline. And as this same transept, at present at least, is connected with the ruined chapel of St. Mary's College, another extensive range is added to the main fabric, from which it can hardly be considered as architecturally distinct. . . . Its general effect is extremely striking, from the remarkable richness of the architecture and especially from its great multiplicity of parts, characters sufficiently marked to have been conspicuous anywhere, but which are the more strongly forced on the eye from their utter contrast with the ragged and weather-beaten aspect of the church without. Possibly the circumstances which conduced to the lack of external ornament may have led its designers to counterbalance this deficiency by a superabundance of internal decoration. Certain it is that very few structures of the same size equal this cathedral in the richness and elaborateness of execution lavished upon this portion of the interior. In fact, much of the solemnity of a Romanesque nave is lost, an effect which is certainly far better produced by more massive proportions and a greater extent of unadorned surface.

It seems almost a miracle that the cathedral should have retained so much of its ancient character, especially when we consider its remoteness and the

* See Illustration.

indifference of some of its prelates. One bishop proposed that it should be taken down and rebuilt on a site that would be more comfortable for those who officiated in it. There was a tradition that another bishop stripped the lead from the cathedral and palace in order that by the sale of it he might increase the portions of his five daughters who were married to bishops. If the additions were of the same character as JOHN NASH's west front, they were as destructive as dilapidations. That has been superseded by one of Sir GILBERT SCOTT's, which at least is an effort at consistency. NASH, according to JOHN CARTER, adopted the principle that variety is charming. But whatever he introduced could not be charged as a servile copy of any other part of the building.

The interior is suggestive of wealthy patrons. There is a large amount of carving, and it is assumed that colour was at one time largely employed. There are six semicircular bays on each side of the nave. The arrangement of the triforium and clerestory is not, however, successful. It is supposed that the nave was to be vaulted. But the roof is of oak, arranged in compartments. The stalls are of exceptional interest, and are believed to have been executed in the time of Bishop TULLY between 1460 and 1480. Grotesques are introduced in the ornamentation. The carvers were allowed their usual license, and were often sarcastic in their emblematic figures. The throne is another elaborate production. The base of the shrine of St. DAVID and a part of St. CARADOC's remain. In VAUGHAN's chantry is vaulting of intricate fan tracery. As the illustration shows, a part of the east remains unroofed as it was some seventy years ago, when a visitor said:—"Sad indeed is the sight, and were it not for the interest which antiquaries take in these ruined portions of the cathedral, it would be better to remove them altogether."

THE LILLE COMPETITION.

FIFTY years have elapsed since it was announced that a competition for the proposed cathedral at Lille had ended in favour of English architects. Not only had MESSRS. CLUTTON & BURGESS gained the first prize of 6,000 francs, and G. E. STREET the second of 4,000 francs, but medals were awarded to three provincial architects, viz. MESSRS. HOLDEN & SON, of Manchester; Mr. CUTHBERT BRODRICK, of Leeds; and Mr. R. P. PULLAN, of Manchester; and honourable mentions to Mr. GOLDIE, of Sheffield; Mr. PEDLEY, of Birmingham; and Mr. ROBINSON, of London. In other words, nineteen designs by French, Belgian, German, Swiss, Luxembourg, and English architects were distinguished, and out of that number eight came from this country, the majority being from provincial towns. This was creditable to English ability, and it was also evidence of the attention given to the study of Gothic at that time. But there is no longer one of the competitors among us to recall so remarkable a contest, and after fifty years the whole of the circumstances are not likely to be remembered. It may therefore be not entirely useless to allude to them.

It is only right to state at the beginning that the competition was not entirely a fair one. Shrewd people in Lille realised that the opportunity of building a great cathedral in Mediæval style would excite the ambition of architects in various countries. Lille, although a very important town, was not a cathedral city, and the Imperial Government had no intention of altering its character. Lille formed part of the arch-diocese of Cambrai, and there was no desire publicly expressed by the prelate who ruled the large see for a division. The clergy of Lille had not sought for a bishop who would live amongst them. Some laymen seemed to think that Lille would gain if it were turned into a bishopric; and the POPE, who was in exile at Gaeta, was induced to sanction the project. The people of Lille at the present time appear to be more intent on business than on

ecclesiasticism. There is little doubt they have not changed their character in half a century. It was supposed, however, that the sight of a large number of splendid designs obtained from all parts of Europe would appeal to them and infuse a little enthusiasm among them for a building which was to surpass all others in Lille. The cathedral would moreover be dedicated to Notre-Dame de la Treille, the patroness of the town. Among a people possessing so much wealth it did not seem difficult to raise 3,000,000 francs, or 120,000*l.*, which was the sum specified in the conditions for competitors, although it could not be supposed that the contemplated building could be erected so cheaply unless labour and materials were in a large measure to be obtained gratuitously.

The length of the church was to be from 100 to 110 metres, and it was to be surmounted by one or two towers with spires. There were also to be three deeply recessed portals. The plan was to consist of a nave with two aisles, single transepts, a choir, a sanctuary and apsidal chapels. The choir was to be large enough to accommodate the whole cathedral chapter. Other buildings named as necessary were a large hall for meetings, two sacristies, a hall for catechising and several rooms. A parvis was considered desirable, a crypt was required with easy approaches, also baptistery and funeral chapels. Brick was suggested for use in walls and vaulting, stone for mouldings and sculpture, and grit for basements.

It was stated that there was a desire to entrust the execution of the work to the author of the best design. But there was no formal engagement on that point. In that case he was to receive an advance of 10,000 francs, which was to be deducted at the rate of 1,000 francs per annum from his percentage. The percentage was to be at the rate of 5 per cent. for the first million expended, 4 per cent. for the second, and 3 per cent. on all subsequent outlay. In case the author did not carry out the works he was to receive 6,000 francs. A second prize of 4,000 francs and a third of 3,000 francs were also promised.

The preparation of a design for a cathedral is a costly speculation. Possibly, also, many architects did not like the security. Although efforts were made to have the competition regarded as if it were a sort of crusade, only forty-one sets of designs were sent in. Fourteen were the work of Englishmen. It was said at the time that the collection as a whole was very striking. But it soon became recognised that in many projects the conditions of competition were not fulfilled. A few of the designs, at least, were of a startling kind, at least to those who were only acquainted with architectural drawings which appeared in the Royal Academy. A correspondent of the *Ecclesiologist* described one of the drawings in the following words:—

This is the production of a madman. The design is one entire insanity. It is a mirage done in all sorts of colours. There are radiating jets of coloured material, apparently spinning and twisting like a thaumatrope. Green parapets, yellow tracery, sky-blue arcades, German flamboyant twisted shafts. We can only describe the whole thing as a *cauchemar*. The inventor could only have produced it after diligent training on raw pork and liquid pigments. The west front is guarded by two ruffian angels, apparently of bronze, flourishing big swords, who recall the Oriental *afrits*. Man of woman born could never face these monsters. They look like the angels keeping guard over Paradise and repelling the faithful from church rather than beckoning them into it. Each of them is exactly 10 metres, = more than 30 feet, high. Above these is a whole flight of bright yellow angels, and then a covey of tender green seraphim. Above them is an open book, then a lantern and staff, then a large text, then, above all, scrambling over the gable and projected clear against the sky, the whole group of the Sistine Madonna with the pretty little cherubs lounging with their chins on the parapet. The intersection of nave and transept is crowned with an iron and glass spire, coloured red, blue, green and yellow, and the whole is surmounted by a great gilded metal glory of 7 metres in diameter, which we believe is to be illu-

minated and most likely would be visible at Calais. Blasphemy, folly and impossibility are combined in this insult to common sense and common decency.

The jury prepared an elaborate report. It was not to be expected that the conclusion would be accepted with general satisfaction. The critics of French papers would have preferred one of their countrymen to have gained the first prize. But able as M. LASSUS was as an architect his design was placed third.

MESSRS. CLUTTON & BURGESS had some doubts about receiving fair play. BURGESS liked a practical joke, and he must have enjoyed the precaution of having the lettering done by a Frenchman, and other customs of French architects imitated. The style adopted was likewise French, and the motto, *Federis Arca*, was familiar to Frenchmen from its introduction in the Litany of Loreto. Evidently the jury were captivated by the design, for in describing it they said:—

Let us distinguish here constructional merit from decorative; the work of the architect from that of the ecclesiologist (*archéologue*). If the details of construction in this plan have not always been treated with the same energy and *élan* so remarkable in the preceding design, the artist has nevertheless shown himself to have been constantly guided by a profound judgment and an elevated sentiment of art. In choosing an over-archaic style of getting up the drawings themselves, he has, of course, waived his chance of pleasing the eye; but—we owe it to him to say—the more his design was appreciated, the more the members of the jury, familiarised with the laws of construction, were led to recognise an ability of the highest order.

Simultaneously with our realisation of the purely constructional excellences of the design, as shown in its admirable proportions, our attention was challenged in the department of ornamentation by a most piquant originality and an affluence of ideas which we should look for elsewhere in vain. The author has given proofs in his details of the highest order of archæological knowledge as well as of artistic ability.

Examine his pulpit, so full of character; his font, so novel in its symbolical treatment; the altar and the ciborium, so grand in their outlines, so full of grace in their decorations; and the pavement, of a design so elaborate and so rich. Everywhere there is evidence of the same fertility of invention, everywhere we see the circulation of the abundant sap of a living poetry. Honour to the unknown artist who, in so extensive a competition, from so well-contested a struggle, has gained one of those triumphs which shed a ray of glory on a whole career.

Mr. STREET's design, which was marked *Quam dilecta Tabernacula*, was described as follows:—

To a profound knowledge of Pointed art its author adds a rare power of conception, which is shown as well in the details as in the ensemble. We recognise here at first sight the work of a great master. In particular, we must fairly congratulate the author on having complied with all the requirements of the programme, and on having faced more boldly than any other competitor the difficulties of employing brick as the material of a monumental edifice. If power rather than grace is the general characteristic of this magnificent creation of art, elegance finds its due place in the ciborium, in which it is combined with a true splendour of ornamentation. After a lengthened consideration we have unhesitatingly raised this design to the second place, and little was wanting to its mounting to the first.

It was hardly to be expected that the *entente cordiale* would have the effect of allowing an English architect to carry out an important public building in any French town. In that sense the competition was a fiasco. Nor has Lille as yet succeeded in becoming a bishopric. But a church dedicated to Notre-Dame de la Treille was commenced, and some English elements, especially from the first design, were introduced. The work has not been carried on continuously, and the building, although used every day, is still incomplete. But the competition was not without its effect in revealing that English architects were able to demonstrate to the satisfaction of French judges that in dealing with a style which was peculiarly French they were irresistible.

NEW BOOKS.

THE increase in the number of books on processes or materials connected with building is remarkable. It seems like a revelation in our time of the Spencerian formula of the homogeneous becoming the heterogeneous. Nobody is now surprised by seeing a book on bricks or mortar, glass, paint or nails. In a short time it is not impossible that treatises will appear on subjects which are even more restricted. The old terms builder, general builder and contractor are beginning to indicate something that is indefinite and belonging to a primitive age. What up-to-date people are supposed to require are specialists. As in medicine, surgery and law, we may expect to see a race of men devoting themselves to particular branches of the building trade. The tendency is especially exhibited in regard to concrete. Not many years have elapsed since concrete suggested an immense heap which could only be the work of the humblest class of labourers. Concrete has now assumed so much importance, it has not only special manufacturers, but special designers and mathematicians. Instead of a mass which was concealed from view, we can now have concrete made in numerous patented forms, and it is considered that ornament is not misplaced when raised on one of the surfaces. The treatise on "Concrete Block Manufacture," by Mr. HARMON HOWARD RICE (New York: JOHN WILEY & SONS. London: CHAPMAN & HALL) is the latest addition to the new concrete literature, which is already represented by so many volumes. In the pages the processes of making are described, but care would have to be taken in adopting them, for the author warns his readers that very many of the machines and designs are protected by letters patent. It may appear as odd to talk of designs in connection with a concrete block as of designs for a brick. It is possible to have simple, solid blocks of cement concrete, but to American ingenuity they are wasteful. Some blocks are made in the form of T's, because they are found to be useful for interlocking and are not heavy. Others have the material removed from the interior, and in that way make air-spaces of various forms. Modifications like those we have described are supposed to confer advantages which blocks of stone do not possess, and the Americans are now using concrete blocks both for public and private buildings. Mr. RICE is in favour of plainness, for few things can be more displeasing to the eye than to see a large number of blocks in a wall in which the imitation of dressing is invariable throughout. If the blocks could be gone over by a mason there would be a change for the better in most cases, but the cement is not adapted for working on with tools. The volume contains a large amount of information which will be new to concrete-workers in England.

While we use metals in construction the subject of corrosion may not be neglected without risk. Both iron and steel being artificial materials and produced on a comparatively small scale, cannot be expected to be uniform in character, and unless there is continual observation it is impossible to say when danger begins from corrosion in a beam. The majority of people are satisfied with a coat or two of paint, which is often applied in so careless a manner that the enemy still has an opportunity to continue weakening the material. By treating corrosion as a phenomenon which affects much else besides iron and steel, and which can act through other agents besides the atmosphere, there is a possibility of obtaining greater security. This method has been adopted by Professor HUMBERT SEXTON in his small book on "The Corrosion and Protection of Metals, with special reference to the preservation of Engineering Structures" (Manchester: The Scientific Publishing Co.). There are introduced in it the results of many experiments. As the author is connected with Glasgow, he does not neglect the decay or corrosion of stone in that city. He tells us that in one case a sample of stone contained

.368 per cent. of sulphate, but the parts subjected to atmospheric action contained no less than 1.86 per cent. A mass of sooty matter which hung like a stalactite from a corner of a public building, was found to contain 64.24 per cent. of mineral matter, of which there was 31.46 per cent. of sulphur as sulphates. With such an atmosphere artificial stone alone can contend, and then only when allowance is made for the corrosive power of the atmosphere. With regard to paints, Professor SEXTON says:—"The use of white lead in any form should be absolutely prohibited in paints for use on structures exposed to wet and impure air. If a white base must be used there are several others available, and zinc white is probably the best." He also has an aversion to low-priced paints, which, he says, are often the most costly in the end. Important structures, he considers, should be painted every year, or at least every other year. We can recommend the book as a trustworthy treatise to all that relates to the covering of substances used in construction.

Three years ago we noticed "The Cathedrals and Churches of North Germany," by Mr. T. FRANCIS BUMPUS. That work was soon out of print. A new edition (published by Mr. T. WERNER LAURIE) has been prepared, in which, among other matter, "notes have been added on the celebrated brasses existing at Gnesen, Lübeck, Meissen, Posen, Schwerin, Verden and elsewhere. The illustrations of the cathedrals and churches of Danzig, Osnabrück, Ratzeburg, Strasburg, Werden and Wismar, which now appear for the first time, form with the rest a unique and valuable series of views which no previous work on the ecclesiology of Germany can rival." German Gothic can be considered as a species apart, although it is supposed to be derived from France. The buildings have also the advantage of being more carefully conserved since the Reformation than the churches of England or France. The German mind was always philosophic, and has endured the presence of the signs and tokens of another creed with equanimity. Indeed, among the lower classes who are church-goers in the towns the accessories are looked on as if they had a connection with the mode of worship now followed. On that account there would be a general outcry if a Sakraments-haus were ordered to be removed from any of the Lutheran churches in which one remained. The respect for mediævalism must be admired by all English archaeologists, although it may appear to be less logical than the practice enforced in England and Scotland. Mr. BUMPUS, while fascinated with so much that met his eyes, was not blinded to defects. Stained glass, for instance, which he has a right to judge, he considers on the whole to be less satisfactory than many of the modern examples produced in England. Anyone who proposes to make a tour in Germany during the present season should carefully read the pages before he sets out, and that he will find a very pleasant duty, and the book should afterwards be his constant companion.

A few years ago London used to be compared to a museum of antiquities. Perhaps the relics were not sufficiently appreciated, and now they are vanishing like PROSPERO's vision. Unfortunately, repose seems to go with them. Hereafter posterity will be grateful to the London Topographical Society for preserving records of some of the fleeting characteristics. In their third volume Colonel PRIDEAUX has notes on SALWAY's plan of the road from Hyde Park Corner to Counter's Bridge, which abound in visions. Who could imagine that WILLIAM COBBETT found he could endure London by living in a house which stood on the site occupied by the Metropolitan Railway station in Kensington? Sir DAVID WILKIE lived in Phillimore Place, and it was there he painted *The Chelsea Pensioners*, *The Village Festival* and *Blind Man's Buff*. Counter's Bridge is a modernisation of a more ancient title. It crosses Stamford Brook, and

on the other side of the creek was a famous nursery. The transformations in Marylebone during the last fifteen years seem to be incredible by the extent of the area. Peaceful old houses and gardens have been swept away like dust. Three houses in which GEORGE ELIOT lived have vanished. EDWIN LANDSEER's house and his brother's, HUXLEY's, LOUGH, the sculptor's, Sir GEORGE HAYTER's and many others have suffered under the besom of destruction. Mr. HILTON PRICE has managed to make out an elaborate list of the signs which in the sixteenth century adorned St. Paul's Churchyard and the neighbouring streets. The Society deserves to be supported, for the sooner descriptions and photographs are secured the more coming archaeologists will be gratified.

CULROSS ABBEY.

WHILE preparing for the restoration of Culross Abbey excavations were at first made at the south angle of the east chancel, where the architects, Sir R. Rowand Anderson and Mr. Paul, intended the heating chamber and vestry should be placed. The excavations immediately proved interesting. The soil had all been filled in, hiding a great part of the old wall of the church, which is built with ashlar, forming a strong buttress basement, with splayed intakes, giving to the superstructure the impression of substantial support. The heritors and architects agreed to change the position of the heating chamber and vestry, and to continue the excavations. The south transept originally had had a side aisle, which had been taken down at the destructive restoration of 1824; and the arcade arches, which divided the transept from the aisle, were built up and formed the east wall of the transept. The side aisle, which is included in the restoration, necessitated excavations, and it is of interest that the original foundations were found to be quite suitable for the new structure.

In excavating for the new floor level for this part remains were found close to the surface. In one instance a body had been buried with the head laid just underneath one of the arches, and in closing up the arched opening in 1824 the builders had built the skull into the wall. Beneath the arch which bears the coat-of-arms of Roger de Quincy, Earl of Winchester, was found the earliest form of stone coffin, which is composed of rough stones set edgewise on the sides and ends, and covered over with one or more of the same. A stone coffin completely shrouded in leather was also found underneath one of the arches, and the leather, which has retained the shape of the body, is in a good state of preservation. The body had been swathed in a heavy woollen shroud, which is also wonderfully preserved. It is supposed that the inhabitant had been a dignitary of the Church, probably a Cistercian monk. Opposite the foot of the coffin was found the foundation of a side altar. In order to ascertain the condition of the foundation of the centre pier of the south transept excavations were made on its south side to a depth of 10 feet. There a great bed of shells was found, chiefly of the mussel variety, besides fragments of ancient delf, glazed, unglazed and rudely ornamented, besides the bones of the horse, ox, sheep and hog. Further excavations were agreed upon with the heritors, and part of the south boundary-wall was taken down for that purpose, and with the material excavated a broad terrace was formed before the mansion-house of Lord Bruce. It was then considered necessary to form a walk from a fourteenth-century doorway in the east wall of the garth or garden leading down to the lower level of the excavations. In doing so part of an octagonal column and base occupying its original position were discovered. Lord Bruce and Sir James Sivewright were much interested in this discovery, and gave orders for further excavations to be made. In taking down part of an old wall at the side of this column, on which stood the sacristy or vestry, the top of a finely-splayed Gothic arch was revealed. The work became most interesting as the made-up ground was being removed. The arch deepened and broadened until the moulded capitals were seen. The first one examined was directly underneath the octagonal column and of the same detail. Unfortunately the capital was broken. The break testified to the unstable conditions of the foundation, and also to the crushing weight that had been built upon the too slender shaft. An examination of the springer over the capital suggested the existence of other crypt

arches. The column to the east of this one is of a different design, having a partly round and pointed column, or keel-moulded column, as Bloxam calls it, attached to an octagonal one. This clustered column had evidently been intended to carry an enormous weight, judging by the very thick walls and buttresses which had served as thrusts to its arches. At the early stages of the restoration it was deemed necessary to erect a substantial buttress a few feet to the north of these two columns, in order to withstand the thrust of the arcade which divides the side aisle from the south transept. In so doing a thick wall was cut into, which occupied part of the space required for the foundation of the buttress. Excavations were made down to a depth of 12 feet below the level of the church floor, and the ashlar faced wall of the south transept continued down to that depth. Portions of human bones were found all the way down until a satisfactory portion of the old wall was reached. The foundations of great columns and bases have since been laid bare at a great depth, and each column is of different design. At one spot there has been a floor laid with small red paving tiles; it may have been a paved court in the eastern entrance to the crypts. There is a thick layer of oyster shells upon it.

SHAKESPEARE'S ENGLAND.

A PARTY of members of the Architectural and Archaeological Society for the archdeaconries of Northampton and Oakham last week visited Stratford-on-Avon. A paper was read by Mr. Alfred Ewen on "Shakespeare in the Country and in the Town." In the course of it Mr. Ewen said Shakespeare was the son of a dealer in agricultural produce, and after receiving the ordinary education at the grammar school, he engaged as a boy in his father's business. Fired by literary ambitions, he was especially fascinated by the drama which was then first developing in England. Having started upon his journey to London, Mr. Ewen pictured the look of some of the country through which he would pass. One of the most interesting books to be found amongst the byways of Elizabethan literature was Harrison's "Description of Britain and England," which contained, amongst other illustrated matter, a map of Shakespeare's road to London. Dr. Furnivall, who edited the book, thus alluded to the map:—"Not being able to find any country maps of Shakespeare's time, with the roads laid down on them, I got Mr. Emslie to make from the Ordnance map a smaller one of the country between Stratford and London, and to colour on it the roads that I supposed Shakespeare would be most likely to travel by. That on the right hand over Edge Hill, through Drayton, Banbury, Buckingham, Aylesbury, Amersham and Uxbridge is the shorter road, and is given by our earliest road map-maker, Ogilby, in 1675, and his successors, as the London road. On the other hand, the traditions of Shakespeare's connection with the lively landlady of the Crown, at Oxford, point to Shakespeare's use (in June 1605, at least, if not 'commonly in his journey,' as Aubrey says) of the left-hand road through Shipston, Long Compton, Woodstock, Oxford, High Wycombe, Beaconsfield and Uxbridge, with the alternative of taking the Henley Road between Oxford and Uxbridge." Some extracts from Harrison and others, contemporary writers, quoted in Dr. Furnivall's edition, gave a vivid impression of the varied country sights and sounds which attracted the eyes and ears of the youthful Shakespeare as he journeyed along to seek, like another Dick Whittington, his fortune in London. A traveller, writing in the year 1592, said that between London and Oxford the country was in some places very fertile, in others very boggy and mossy, and "such immense numbers of sheep are bred on it round about that it is astonishing." Of game he wrote:—"England has great store of fallow deer of various colours, as well in the woods as in enclosed parks; likewise red deer, stags and other game, though few and small, but no wild boars nor wolves are met with in this island, and no roes; but there are foxes and hares, vast numbers of rabbits and coneyes." Harrison wrote that in every shire in England there was great plenty of parks, and of gardens he said:—"If you look into our gardens annexed to our houses, how wonderfully is their beauty increased, not only with flowers, but also with rare and medicinable herbs." Mr. Ewen confessed that he was tempted to wander at this stage, and to call attention more particularly to the way in which, from those extracts of the raw material, the imperishable poetry of "As You Like it" and "A Winter's Tale" had

been extracted. Proceeding, he could not refrain from adding a quotation from Hentzer, who, writing in 1598, described in picturesque language a Berkshire "harvest home." Such a sight was doubtless seen by Shakespeare as he journeyed through Merry England, and his exquisite recollections of it in "A Winter's Tale" were thoroughly English, although the scene was laid in Bohemia. Shakespeare must have had an extensive acquaintance with the places of public entertainment between Stratford and London, and they had only to recall scenes from the "Taming of the Shrew" and "Henry IV." to convince them that he was equally at home in the village alehouse and the London hostel. "Those towns," said Harrison, "that we call thoroughfares have great and sumptuous inns builded in them for the receiving of such travellers and strangers as pass to and fro. Every man may use his inn as his own house in England. Our inns are also well furnished with napery, bedding and tapestry, especially with napery, for besides the linen used at the tables, which is commonly washed daily, is such and so much as belongeth to the estate and calling of the guest. Each comer is sure to be in clean sheets, wherein no man hath been lodged since they came from the laundress. If the traveller have an horse his bed doth cost him nothing, but if he go on foot he is sure to pay a penny for the same." Then Harrison went on to tell particulars which were not quite so satisfactory. He related how the guests' horses were attended by ostlers who often cheated the horses of their food and were, in company with the tapsters, in league with robbers. Either the ostler or the chamberlains would try the weight of the traveller's packet and tell the highwayman of it. "If you give your packet to the landlord to keep that is evidence to the servants that it is valuable, and you are sure to be robbed," was another of Harrison's impressions. Soon after his arrival in London Shakespeare seems to have obtained a situation with James Burbidge, the proprietor of the first regular playhouse erected in England, which was known by the name "The Theatre," and was in Shoreditch. In consequence of a dispute with the ground landlord, Burbidge pulled down "The Theatre" and erected the celebrated Globe playhouse on the Bankside. An interesting description followed from Mr. Ewen of the neighbourhood of the Bankside and a description of the interior of the Globe.

DEVIZES CASTLE.

THE members of the Berks Archaeological Society and the Newbury District Field Club visited Devizes last week. At the castle Mr. Walter Money read a paper of which an abstract is given in the *Reading Mercury*:—

The *castrum de Divisis*, or *ad Devisis*, i.e. the castle at the "points of boundary," which from peculiarity of situation on the dividing line between two hundreds and at the meetings of three manors gave the name to the modern town of Devizes, has been the scene of several important historical events. Although the origin of the town has been variously ascribed to the Britons, the Romans, and even to Alfred the Great, there is no authentic history until the reign of Henry I., when its Norman castle was erected by Roger, the third bishop of Old Sarum. This worthy was originally in charge of a little country church near Caen, and the English king while warring in Normandy attended his church for mass. His prompt method of conducting the service pleased the king to such a degree that he at once installed him as his own chaplain. Appointed to this office, Roger brought to the help of the Prince, who was harassed with that "eternal want of pence that vexes public men," the ability of a fine financier, and when he became king Henry quickly advanced him to be Chancellor of England, in which office he did for his master in his public what he had done for him in his private capacity, namely, "put him on a business footing," so that eventually Henry became possessed of great wealth. He was appointed Bishop of Old Sarum in 1102. The erection of Devizes Castle seems to have been his principal work, and it had not long been built before its massive walls were found very convenient as a State prison. King Henry imprisoned his eldest brother here for some time, and subsequently the castle passed into the hands of Stephen, who placed his own son-in-law, Hervey of Britain, in charge. He held it with the utmost courage, but eventually the fortress fell into the hands of the partisans of Matilda and Hervey was obliged to fly from England. Then came Matilda herself. She had made her escape from

Winchester to Ludgershall Castle, from whence she hastened on horseback in male attire, attended by her faithful Brian Fitz Count and a few followers, to Devizes Castle, and here, one authority says, she was placed on a litter and carried to Gloucester. The tide of events subsequently turning in favour of the Empress Matilda, she came again to Devizes, and held two Councils there in 1142. During the absence of Richard I. in the Holy Land the castle fell into the hands of Prince John, who on succeeding to the throne, regarded it as one of his principal strongholds, for it became the receptacle of much of the Royal treasure. In the reign of Henry III. the castle was the scene of another adventure. In 1233 Hubert de Burgh, Earl of Kent, who had been Prime Minister to Henry, was confined here, but with two of his attendants contrived a plan of escape. They carefully watched their opportunity, and on the night of Michaelmas Eve, the garrison being asleep, one of them kept watch while the other took Hubert on his shoulders, fettered as he was, and descending from the tower, they passed through the castle unnoticed till they reached the great gate, where they went out and made their way to the adjoining church of St. John, where Hubert was safely deposited before the high altar. His flight was discovered and he was dragged back to the castle, but the privilege of sanctuary had been violated, and the Bishop of Salisbury succeeded in getting him again replaced in the church, the king at the same time giving strict orders to the sheriff of Wilts to blockade the church and prevent his escape. However, a strong body of Hubert's friends appeared on the scene, and having scattered the sheriff's men carried Hubert off in triumph into Wales. For several following reigns the castle of Devizes remained peaceably in the hands of the Crown under the command of successive governors. In the reign of Henry VIII. a great part of the castle had fallen into ruin. Leland says:—"The keep or dungeon of it, set upon a hill cast by hand, is a piece of work of an incredible cost. There appear in the gate six or seven places for portcullises, and much goodly building was in it." Part of the towers of this castle were carried away to the building of Old Bromham House, but "there remained yet divers goodly towers in the outer wall of the castle, but all going to ruin." Some part of the building, probably the keep, seems to have been left, and was to a certain extent defensible even a century later, for in the Civil Wars it was held for the king by Sir Charles Lloyd, and surrendered September 24, 1645, after which it was utterly demolished and passed from the Crown into private hands. In 1643, it may be mentioned, Waller, the Parliamentary general, had a crushing defeat here at the hands of the Royalists on Roundway Hill, when 2,000 of his men were either slain or taken prisoners. The ruins evidently furnished a quarry for the townspeople, for in pulling down old houses stones are found among the foundations with Norman mouldings, which evidently came from the castle. The fortress was a place of immense strength and the costliest workmanship. It stood on a kind of promontory strongly defended by nature. The keep or central tower was surrounded at a convenient distance by a wall 12 feet high, and without this wall was a deep moat and drawbridge protected by a tower, called the barbican, on the external margin of the moat. To an old French word "bretesque," a word used for a wooden tower placed over a drawbridge at the entrance of a castle, the town of Devizes owes the singular name of Brittox, still retained in one of its streets, which probably communicated with the ancient entrance to the castle.

COLLAPSE OF TOWER, OTTAWA.

ON April 5 last the tower on the new wing of the Western Departmental Block on Parliament Hill, Ottawa, Can., collapsed at 11.45 o'clock, and is even yet (end of May), says a correspondent of the *American Architect*, a heap of ruins, a source of mortification to the Government and a serious loss to someone—the contractor probably. As if by miracle no one was hurt, although four men were working on the tower at the time. The new wing was built from east to west, from one of the older wings of the building to another. Its style of architecture was exactly the same as that of the older part of the building, and the outer surface of the wall, like that of the rest of the building, was of Nepean stone, trimmed with drab sandstone. At the north-western corner of the wing was a square tower rising to the height of about 100 feet and capped by a copper roof of pyramidal form.

Work on the wing was continued through the winter, and at the time of the collapse was about complete. Suddenly two blocks of stone slipped and fell to the ground. This was a providential warning to the men, and probably saved their lives. While they were in the act of swinging themselves by ropes to an open window in the adjoining old part of the building two-thirds of the tower and the entire top fell—a mass of cut stone, crumbled cement, twisted iron beams and crumpled sheets of copper. Mr. George Goodwin, hitherto considered a responsible man, was the contractor. The accident ruined about one-fourth of the new wing.

To learn authoritatively where the blame lay, the Canadian Government appointed a commission composed of two well-known Toronto architects, Messrs. Cury and Hutchinson, to investigate and report on the collapse. Their findings are as follows:—

"1. That the walls as built by the contractor were not according to the specifications prepared for this work, and that the bad quality of the work was sufficient cause for the collapse of the tower.

"2. That the plans and specifications prepared for this work were not as explicit and clear as they might have been; they were, however, reasonably and sufficiently clear to enable a contractor to determine the quality of the work required.

"3. Your Commissioners consider that the constructional design of the tower at and above the quatrefoils and water-tables and the introduction of steel beams in the manner shown on the drawings was faulty and defective in that the quatrefoil openings weakened the wall at a point where the full strength should have been maintained, and the steel beams brought a concentrated and eccentric load upon the wall at its weakest point, the more serious defect of the two being, in our opinion, the construction of the steel beams.

"4. That there was no proper and efficient supervision of the works by the Department from the level of the ground upwards.

"5. That the main building, owing to the use of block stone in the backing, is safe, the work being of substantial character. It may be that the facing is not properly bonded with the block stone backing. This we have no means of satisfactorily determining, as it would not be advisable to take down any of the Nepean-stone facing.

"6. That it was inadvisable to proceed with the erection of the upper portions of the tower in the months of November and December, especially as the walling at and below the water-table had been built late in the fall, and the lime mortar had not had opportunity to set.

"7. That the contractor must be held responsible for the collapse of the tower in that he did not carry out his work in a good and substantial manner in accordance with the plans and specifications, or take any precautions to see that the work was thoroughly well built at all points, when it should be self-evident to any intelligent or practical builder that the construction shown required special care and attention.

"8. That the Department of Public Works is also responsible in that it did not properly supervise the work and detect and correct faults of construction as the work progressed."

The Commissioners discuss the nature of the work at considerable length. They say, among other things, that if 3 tons per square foot would be a safe load on walls as built in this tower, then from ten to fifteen tons would be an equally safe load on walls built according to the specifications. They declare, however, that the masonry used in the tower was of such a character that it would have been overloaded with even three tons per square foot, and that had it been of the quality required by the specifications it could safely have borne a load of at least ten tons per square foot. The Commissioners further believe that the tower could and should have been built in a safe and satisfactory manner if reasonable intelligence and care had been exercised by the contractor, notwithstanding the defects in the constructional design. The Commissioners are severe upon Mr. L. F. Taylor, the Government architect who was placed in charge of the work and was responsible to the chief architect. The defective constructive design does not appear to have come under the notice of the chief architect, Mr. Ewart, as he stated that he was not aware that any changes had been made from his instructions to make the tower the same as the two towers on the south elevation of the west block.

NOTES AND COMMENTS.

IF Mr. CARNEGIE should hereafter decide about the erection of another class of buildings in addition to his libraries, we hope that as he has had the advantage of experience, he will stipulate that proper arrangements should be made about the designing of them. In a great many places the existence of architects has been ignored, and the plans have been prepared by hands that were accustomed to never go beyond arrangements for drainage. But then committees were able to boast that as they had prepared shelters at a cheap rate, Mr. CARNEGIE'S grant was applied to other purposes connected no doubt with the library. An instance of the injustice to architects is now exhibited in Northampton. Mr. CARNEGIE has generously offered to give 15,000*l.*, which it is proposed to divide into five parts—four being assigned to the building and one to the heating, lighting and furnishing. In Northampton there is a large amount of energy, and it is now being exerted to have the arrangements concluded before public opinion has been able to assert itself. There are several architects in the town, and they have sent a petition to the Mayor and Town Council in order that the library might be made the subject of a competition among local architects. They say that "the proposed library building affords a fine opportunity of adding to the architectural features of the town, and we respectfully beg to suggest that to obtain the very best ideas both as regards convenience of plan and excellence of design the whole of the architects practising in Northampton should be invited to submit competitive designs." The principal objection to obtaining the aid of an architect is that it would be necessary to pay him his fees. May we ask Mr. CARNEGIE, does he approve of an evasion of an economic law, and whether he would have gained the wealth which he so generously distributes if people in America dispensed with steel and adhered to obsolete methods of construction?

IF the fire enemy was to have a victim from Hamburg English architects would join in imploring that the church of St. Nicholas should be spared. That was erected after the great fire of 1842, and GILBERT SCOTT'S design demonstrated to foreigners that German Gothic was not a mystery to Englishmen. The church of St. Michael, which may be said to be destroyed by the fire this week, was almost in a line with the church of St. Nicholas. Although on the site of an older building, which was destroyed by lightning, the church which suffered dates only from 1762. It was remarkable for its steeple, which was 432 feet high, and from whence a wide view of the surrounding country could be obtained. The length of the church is 229 feet, and it has a breadth of 179 feet. Until the erection of St. Nicholas the church of St. Michael was the most admired of all in Hamburg, and during the French invasion it was the only one which the people were able to save from desecration. On that account St. Michael's is likely to be rebuilt. But it is doubtful whether another chance will be offered to English architects to gain a victory.

WHAT is the use of a minister of fine arts unless he can provide public commissions for artists? Evidently M. BRIAND is of that opinion, for he allows his second-in-command, M. DUJARDIN-BEAUMETZ, to seek occasions and places where art can be turned to account. His latest project will receive general commendation in Paris. All visitors are aware of the great group facing the Place du Carrousel, which is the memorial of GAMBETTA. Behind the group is an open space where grass grows, and which is described as a garden. The ministry have had the happy idea of introducing four great groups of sculpture which are to occupy the four corners. One is already arranged for; it will be a work by M. LANDOWSKI, typifying music and poetry. The others

will be devoted to painting, sculpture and architecture. Busts of representatives of the arts will be placed between the groups. In the centre it is proposed to place a group which will recall the landscape art of France, and which at first was destined to be placed in the Champs-Élysées. A project of that kind cannot be realised in a hurry, but as a plan has been prepared by M. REDON, the architect to the Louvre, commissions can be given to a large number of sculptors. The question must arise whether the GAMBETTA group may not be out of place in such a company. Oratory is recognised as one of the oldest of the arts, and he represented it most effectually. However inappropriate the group may be it is not likely to be removed so long as Republicanism holds sway in France.

LIBRARY. HERNE HILL.

THE new Carnegie Library, erected in Herne Hill Road, S.E., for the Council of the Borough of Lambeth, is to be opened on Monday next, July 9. The site is sufficiently large to allow the chief rooms of the building to be placed upon the ground floor, and the building is planned so that all the departments are entered from a spacious central hall with vestibule. The walls dividing the principal rooms are fitted with glass screens, and efficient supervision from the inner desk is obtained thereby. Owing to the fall of the ground, and also for general architectural effect, the two wings of the library were designed higher than the main building. Advantage has been taken of this to provide in the east wing apartments for the librarian, who will thus be resident caretaker, and in the west wing (over the children's room) a lecture hall which will comfortably seat 200 adults. This hall, it is expected, will form a most valuable and useful adjunct to the library. The buildings externally are faced with terra-cotta of a light colour and Istock red bricks, the roofs being covered with Tilberthwaite light sea-green slates. The walls internally are finished with Sirapite plastering for distemper, and eventually for paint. The principal rooms have dadoes 4 feet high, finished with dado moulding and skirting. The halls and staircases have tiled dadoes. The ceilings throughout are of plaster with the usual cornices, mouldings to beams, &c. These are partly shown on the plan by dotted lines. The floors generally are finished with pitch pine wood blocks, and the halls with terrazzo paving. All the floors, except that to the second floor of librarian's house, are of fireproof construction. The main staircase leading to lecture hall is of stone. The lending library is arranged upon the "open access" principle of allowing the readers to go to the shelves and choose their own books. This room contains 3,000 square feet, and is sufficiently large for the shelving of 50,000 volumes. The reading-room for children contains 1,197 square feet. This room has also the great advantage of a separate entrance from a side street, thus minimising any inconvenience which might be caused to the adult users of the library by the entrance and exit of the children. The contractors were Messrs. HOLLIDAY & GREENWOOD, LTD., of Loughborough Park Works, Brixton; the heating and ventilation by Messrs. R. CRITTALL & Co.; the wood block floors and tiling by the Art Pavements and Decorations, Ltd.; the lead glazing by Messrs. JAMES & Co., of Kentish Town; and the library fittings by the Library Supply Company. Mr. A. ROBERTS was clerk of the works, and the architects Messrs. H. WAKEFORD & SONS, of 267 Clapham Road, S.W.

A black and white photograph of a large, ornate, multi-story building, likely a government or institutional structure. The building features a prominent central tower with a gabled roof and a small cupola. The facade is characterized by numerous windows, some with decorative frames, and a series of gabled roofs along the top. The building is situated on a street with a sidewalk and a fence in the foreground. The overall style is reminiscent of late 19th or early 20th-century architecture.

LITHOGRAPHY IN ENGLAND.

THE death of William Day, which occurred on June 25, removed the last of the old lithographers. The firm of Day & Son may be said to have been associated with the art from its introduction into England. Out of the premises in Gate Street have issued such creditable works as Owen Jones's "Grammar of Ornament," Digby Wyatt's "Industrial Arts," David Roberts's "Sketches in the Holy Land and Syria," William Simpson's "Crimea," &c. There were also several plates produced in the establishment of Day & Son, and for a time lithography appeared to be a rival to engraving. In its turn it has had to give way to photographic reproduction in several forms. William Day, who was in his eighty-third year at his death, was connected with the business before the Exhibition of 1851, and he was able to aid in the promotion of that enterprise and to publish several records of it after its closure.

The art of lithography, as is generally known, was discovered through accident by Alois Senefelder. It was at once adopted eagerly both in Germany and France. The education of artists in those countries and their facility in drawing rendered chalk lithography an easy and delightful mode of multiplying their productions, and in their practised hands susceptible of greater beauty, richness and feeling than the process of engraving. They had little else to do but to use stone instead of paper, and grease instead of chalk to produce the same effects, and by means similar to those they had been learning during the whole course of their studies, and they had the additional satisfaction and advantage of seeing facsimile impressions of their drawings multiplied to the extent of thousands. If they had been purposely educated with a view to the practice of lithography the painters could not have been more competent to avail themselves of its advantages and to develop its capabilities, more particularly in the production of designs of figures and portraits, which the taste and fancy of the French artists quickly put forth to a numerous extent.

Lithography being far cheaper than engraving was well adapted to popularise the fine arts. The "Munich Gallery," which was the first grand work in lithography, not only afforded an instance of the efficient patronage of Maximilian Joseph, king of Bavaria, under whose auspices that magnificent work, consisting of copies of the pictures in his collection, was commenced and carried on, but it enabled people to realise some of the characteristics of the great masters. The "Stuttgart Gallery" followed. The quaint style and the hard manner of the early Flemish and German painters seemed to be adapted to lithographic reproduction.

In France there were still more facilities for practising and extending the art. Caricatures were an institution in that country and lithography enabled designers to exhibit plates of incidents a few hours after they occurred. Charles Vernet and other artists took advantage of the popularity of the army by their military scenes. At the same time the art was employed in important works. Baron Taylor's "Voyages Pittoresques" was a revelation of the French provinces to Parisians. It is remarkable that although there was little encouragement for lithography in this country, yet plates by Harding, Prout, Haghe and others were included in that great work. The drawings were made in London and printed at Hullmandel's establishment, whence they were sent for publication in Paris. In purity and brilliancy the English surpassed the French drawings, owing to some extent to the care of the English printers.

The first work of importance published in England illustrated by means of lithography was "Belzoni's Travels." The traveller, having seen the sketches drawn and printed by Hullmandel, applied to him as a friend to lithograph the plates illustrating his researches. This successful and interesting specimen of lithography had the effect of recommending the art, and from that time the number of artists who made trial of its capabilities daily increased. Among the first after Hullmandel were Nicholson, Prout, Harding and William Westall. Nicholson drew a series of sketches of romantic scenery in England, which, though evincing great skill and feeling for the picturesque, were misty and undefined, and not calculated to produce that decidedly favourable impression of the powers of lithography made by the vigorous boldness of Prout's and the force and brilliancy of Harding's drawings.

It is the peculiar advantage of lithography that the practice of drawing on the stone may easily be acquired, and thus the artist is enabled to produce multiplied facsimiles of his own works, wherein the style, the effect and the peculiar touch of the master shall be preserved. Litho-

graphy is not merely another mode of engraving in addition to the others out of which the artist may choose a skilful draughtsman to copy his works; he may with a little previous study and practice be his own draughtsman, and thus the admirers of his style may possess his original drawings at the price of prints. This advantage has not been rendered available by painters to that extent which one would suppose, owing to a want of commanding skill in the use of the pencil or crayon. Among those, however, who have successfully employed lithography with success to this end was James Ward, R.A., the animal painter, who produced a series of drawings of horses and dogs, characterised by all that boldness and vigour, truth of nature and identity of character which distinguish his paintings. Lithography in the hands of Samuel Prout also was made to produce some masterly specimens of his broad and rapid touch and picturesque style, more particularly in his "Views on the Rhine," of the quaint architecture in the old towns in Germany, and the tottering dilapidated houses in their narrow, sinuous streets. His works are also scattered up and down the series of lithographic drawing-books from 1824 to the present time, and he contributed jointly with Hullmandel, Harding and Westall to the "Britannia Delineata," of which Kent was the only county illustrated. In the drawing-books just mentioned will be found also a great number of original sketches by J. D. Harding, many of them of great beauty, and all partaking of that sparkling effect, free and glancing touch and picturesque character which give such grace to his sketches from nature. They contain also some admirable heads by Carbonnier, one of the most perfect masters of the crayon in England; and many clever bits of scenery, coast scenes, figures and craft, by Hullmandel, plain, bold, simple and artist-like, and most useful as examples for imitation, especially in the working of tints, which are evenly and firmly laid—a point of great importance in lithography.

Harding was not only one of the first to avail himself of the advantages of lithography and to develop the capabilities of the infant art, but he contributed in a great degree to its popularity by the number, variety and excellence of his drawings. His fame as a lithographic draughtsman vies with his reputation as an original artist, for he not only produced pictorial effects which were unrivalled, but he made every subject his own, lending to it an air of originality and a painter's feeling. His talent was not, however, confined to landscape; he produced several elaborate and highly finished drawings from popular pictures, such as "Portia and Bassanio," from Briggs; "Macready as Henry the Fourth," from Jackson; "The Law," one of Bristowe's monkey pictures (a brilliant and forcible drawing); "The Robin," from J. Hayter; "The First of September," from Farrier, &c. But the most interesting, as it is the most varied and excellent of his works, is the "Series of Sketches by Bonington," the young artist who died in the very dawn of his fame.

Richard Lane, who was afterwards lithographer to Queen Victoria, abandoned engraving for lithography, and the brilliant success that attended his efforts in this new art gained for him the distinction of Associate Engraver of the Royal Academy. His excellence consisted in the extreme neatness and delicacy of his drawing and the high degree of finish which he attained, combined with purity and brilliancy of tone and effect. One of his first works was a "Series of Sketches by Gainsborough," a picturesque and delightful work, the feeling and truth of which are admirable; in these respects he has not surpassed that work in his series of "Imitations of Sketches by living British artists," though in elaborate finish he has gone far beyond it. The most remarkable specimens of his talent in that work are the "Don Quixote and Sancho," from Leslie, a rich, brilliant and forcible print, and one of the finest specimens of finished lithographic drawing that has ever appeared. It is only surpassed by his celebrated drawing of "The Rivals" from the same artist. The union of softness and sharpness, of force and delicacy, of richness and brilliancy, of depth and purity, exhibited in that inimitable performance render it almost unique as an example of the powers of lithography. Popular prints, "The Girl at her Devotions" and "The Girl at her Studies" from Newton, also extended the reputation both of Mr. Lane and lithography. One of the latest prints of the series of "Imitations of Sketches," and the most popular, is a delightful picture by Edwin Landseer of Lord Cosmo Russell on a Highland pony. Lane's "Imitations of Sketches by Sir Thomas Lawrence" are remarkable for beauty of drawing. Had

Lawrence lived, lithography would in all probability have received a great acquisition of popularity from the favour with which he regarded the art in consequence of this successful trial of its capabilities; and in all probability he would have made some drawings upon the stone, for which his skill in the use of the crayon qualified him. To have been able to purchase a sketch by Lawrence himself for a few shillings would have opened the eyes of the public to the peculiar advantages of lithography, and have induced other eminent artists to make it the medium of multiplying their original sketches. So much has fashion to do with the success of an art whose utility is even obvious. Lithography, indeed, has had to contend with the prejudices of too many English artists, merely because their deficiency of skill in handling the crayon has rendered its advantages only partially attainable by them.

There was no artist sixty years ago who surpassed Louis Haghe as a lithographer. No subject came amiss to him; he rivalled Harding in landscape (trees excepted), and drew marine subjects with technical correctness. He drew on stone with his left hand. His lithographic drawings are singularly brilliant and effective, owing to the facility of his handling and the rapidity and certainty with which he worked. His foreign education as an artist enabled him to produce with the greatest quickness and certainty any effect he required, so that he made a drawing offhand. The greatest effect with the least labour is the ultimatum of lithographic drawing. He was admirable in representing Belgian and other continental buildings, and it is interesting to compare his method with Prout's.

According to a common saying, there is no accounting for tastes, and it is a puzzle to discover why a kind of representation which French and German amateurs continue to prize should find so little favour among Englishmen. There is less of mechanics in lithography than in engravings, but in the auction-room the former alone attract bidders. Hereafter there may be a change, and without entering into the question of money value, it will be found that lithographic plates can afford much pleasure at a limited outlay. They are consequently well deserving of the attention of collectors. Examples of the plates produced by such a firm as Day & Son would by themselves form an interesting gallery.

KEATS-SHELLEY MEMORIAL.

SOME three years ago a group of British and American literary men in Rome, at the initiative, to their honour be it said, of the American members, organised informally a movement to purchase by popular subscription the house on the Piazza di Spagna in which John Keats died, and to establish therein a permanent memorial of Keats and Shelley, consisting of a library of their works in various editions, together with portraits and manuscripts connected with them. The trustees of the memorial would also assist in protecting from future disturbance the graves of the poets and of their two companions, Severn and Trelawny, who are buried beside them in the beautiful cemetery outside the Porta San Paolo.

Committees have been formed in England and the United States to give effect to the project. His Majesty King Edward, to whom the scheme was early submitted, has been graciously pleased to signify his sympathy with the labour of love which united the two great branches of the English-speaking race in doing honour to the poets' memory. The President of the United States has also given warm-hearted testimony to his anxiety to see the project realised. It is a further matter of special gratification to know that King Victor Emmanuel has chivalrously extended the hand of welcome to the proposed institution.

The first great difficulties which beset the acquisition of the house have been surmounted, and the British and American committees are at length able to announce publicly that they have secured an option on the property, thanks to the support which has been privately enlisted. They now trust to the generosity of all lovers of English poetry to enable them to complete the purchase and place the house beyond danger of destruction or absorption (as at one time threatened) into a big hotel. The time available for the completion of the purchase is necessarily limited, and the response must be prompt and generous if this appeal is not to be made in vain. It is hoped, too, that the humbler contributions of less wealthy admirers of Keats and Shelley will help to reinforce the contributions of those who are better able to afford larger sums. Up to now the

amount raised privately has been on a much more generous scale in America than on this side of the water, and Great Britain owes it to herself, as the birthplace of these two immortals, to redress the balance.

The sum required for the actual purchase of the house is slightly over 4,000*l.*, but it is hoped that it may be possible to collect more than the sum necessary for the mere acquisition of the house, in order that sufficient means may be provided to equip it worthily, to provide for its structural maintenance, caretaking, &c., and possibly to make it hereafter a centre from which a love of poetry and literature in our language may be diffused.

The committees appeal, therefore, not only for the purchase money but for enough to provide an ample endowment fund, and in such a cause they do not think that they will appeal in vain to the many thousands of their fellow-countrymen and women who cherish the memory of the two poets and are grateful and devoted admirers of their works.

Donations may be sent either to Mr. Harould Boulton, the honorary secretary, 120 Victoria Street, or to Messrs. Child & Co., bankers, 1 Fleet Street, for account of the Keats-Shelley Memorial.

CONCERNING SLATES.

AMONGST the manufacturing industries which during the last one hundred years have expanded into large proportions is the production of roofing slate. Before the introduction of canals and railways into the British Isles the use of the slates of Wales, Cumberland, Scotland and Ireland was restricted to the immediate neighbourhood of the quarries from which they were extracted, and buildings in various parts of the country far removed from these quarries were supplied with roofing materials from other sources.

In many districts tiles of burnt clay formed the only available material, while in others flag stones and tile-stones from the carboniferous, triassic or oolitic formation were extensively used. In the eastern and central districts of England the tile-stones of Stonesfield, near Oxford, those of the Cotswold Hills and of Colly Weston formed an available source of supply, and it must be admitted that their greyish colour and general appearance harmonise well with the prevalent Gothic or Tudor styles of architecture of those districts.

To such an extent is this admitted that these tile-stones (erroneously called "slates") are still largely used in the counties of Northampton, Oxford and Gloucester, even when the Welsh slate might be obtained at an equal or less cost, and owing to their heaviness, the high-pitched roofs, which are so ornamental, and add so much to the appearance of buildings, became a necessity.

In no country of equal extent has the art of slate quarrying reached such proportions as in the British Isles, and especially among the mountains of North Wales.

The slates from the Pass of Llanberris are generally purple or greenish, locally becoming greyish, and are amongst the smoothest and strongest in Wales.

As to the origin of the cleavage structure, Mr. Davis adopts the "mechanical theory," which ascribes the structure to the enormous lateral pressure to which the rocks have been subjected when undergoing contortion.

Names of Slates.

The whimsical names now in use, "Princesses," "Duchesses," "Countesses" and "Ladies," were said to have been given by General Warburton, the proprietor of some of the great quarries in North Wales about a century ago. Perhaps it is not generally known that before that time names still more whimsical were used. The following list is taken from that very extraordinary collection of curious information, a "Portable Library," by Randle Holmes. As he was a Cheshire man, we may be pretty sure that he gives us the names then used in the slate districts:—

Names of Slates according to their several Lengths.

Short hag hattee.	Warnetts.
Long hag hattee.	Shorts. [won.
Farwells.	Shorts save one, or Short so
Chits.	Short backs.
Long backs.	Short twelves.
Batchlers.	Long twelves.
Wivetts.	Jenny why jettest thou.
	Rogue why winkest thou.

"The shortest slate is about 4 inches; all the rest exceed

an inch one in length from the other; sometimes less or more—according as the workman pleaseth."

According to this explanation, the "Long twelves" were about 16 inches in length, or 12 inches longer than "Short hag hattees," hence probably the name "Long twelves."

The largest slates, "Rogues," must have been about 18 inches long; there is nothing said about the breadth.

The names given to the various sizes of slates in Wales, "Queens," "Duchesses," "Countesses," "Ladies," &c., according to a newspaper cutting of 1839, drew from the pen of the late Mr. Leycester, who was many years a judge on the Welsh Circuit, a very witty poem, of which the following lines will serve as a specimen:—

This countess or lady, though crowds may be present,
Submits to be dressed by the hands of a peasant;
And you'll see when her Grace is but once in his clutches
With how little respect he will handle a duchess.

How did slates acquire these new names? In "Antiquities of Llanllechid and Llandega," by Hugh Derfel Hughes, we read:—"About the beginning of this century a slate merchant of the name of Docer, going through the quarry with Lord Penrhyn, advised him that all the slates should be made of such and such a size, and this is the origin of the name 'Docers.' By this time the skill of the quarryman and the slater found some new plan continually. One wanted to do this and another that, and his Lordship failed to please everybody. His lady, however, seeing him in this plight and in continual trouble, advised him to call the slates after the names of the degrees of the aristocracy. He took up the suggestion, and called the 24 by 12 slate a 'Duchess,' the 20 by 10 a 'Countess,' and the 16 by 8 a 'Lady.'"

The following quotation from an article in a Plymouth paper on "Old Delabole" says:—"Each size has its name, and this is where 'Ladies' come in. For instance, slates measuring 24 by 12 are 'Princesses,' and after them each size shorter by a couple of inches than its predecessor come in order named 'Duchesses,' 'Countesses' and 'Ladies.' Promiscuous sizes, larger than 'Princesses' and smaller than doubles, are called respectively 'rags' and 'scantles.'"

The First Slate Quarry Lit with Gas.

The following, from the *Dublin Local Advertiser*, November 10, 1858, is worthy of notice:—"This slate quarry is situate near Festiniog, North Wales; it belongs to Mr. Samuel Holland, and is worked through different levels into the inside of the mountain to the distance of more than 1,000 feet, the mode used being to make openings in the solid slate rock at the end of the tunnels 30 feet wide, high and long, and then leaving a pillar of slate of the same dimensions before making another opening. In these excavations no daylight can enter, the light of candles being found the only source through which the men worked up to last spring, when the proprietor employed Mr. John Walcott, engineer, to erect gasworks and fit up the slate quarry with gas. These works have now been in operation two or three months, and have given every satisfaction to the owner."

Blewe Slate, Cornwall.

Old Fuller in his "Worthies of England," first published in 1662, writes:—

"These are commonly found under the walling-slate when the depth hath brought the workmen to the water. They are thin in substance, clear in colour, light in weight and lasting in continuance. Generally they carry so good a regard that (besides the supply of home provisions) great store of them are imported into parts of the land, and transported into France and the Low Countries. All that I have to say of slate is that Cimyr, the son of Agiopaë, is said first to have found them in Cyprus for the covering of houses."

Slate Making.

The business of making slates is an exceedingly simple operation, one, however, which nevertheless demands from the workman no small amount of intelligence, exactness and dexterity, besides a good deal of practical acquaintance with the nature of the materials with which he has to deal. It consists in detaching the slate formation in blocks from the mountain side, in sawing the blocks when thus detached into suitable sizes, lastly, in splitting and dressing so as to bring them into proper shape—a process which is performed sometimes by machinery, but more generally by hand labour. It is to the industrial arrangements by which this operation is carried out that it is desired now to invite the reader's attention. They are as follows:—

"The portion of the slate which it is proposed to work is divided into sections carefully marked out, which are let out as 'bargains' to as many small co-partneries, consisting generally of three or four working men. The co-partneries 'contract' to produce slates, each from the section of the rock assigned to it, according to sizes and shapes at so much per thousand. The men who take part directly in these contracts form perhaps a third of the whole quarrying population; they are, as might be expected, the older, more experienced and better-off portion of it; the remainder are employed by them as labourers at fixed wages under the name of 'germyms,' apparently the Welsh equivalent for 'navvies.'"

Slate in America.

Few people have any idea of the magnitude of the slate industry in the United States. At present the total amount produced of roofing slate alone is about 500,000 squares a year. A "square" is 100 square feet, or sufficient to cover a space of 10 feet by 10 feet when laid on the roof. As a roofing material slate is becoming more generally used, as it lasts a lifetime, is fireproof, needs no painting and renders rain-water pure and untainted. Most of the quarries are in Eastern Pennsylvania. More than one-half of the total product of the United States comes from that region. The quarries at Bangor, Pennsylvania, are considered superior to any, as the slate is tough, durable, and of an unfading dark, blue-black colour. Over 3,000 men are employed in Eastern Pennsylvania; the workmen are mostly Welsh and English. They earn good wages, have comfortable homes, and are a happy, sober and industrious class.

The slate is first blasted out, then hoisted by steam power in irregular shaped blocks to the bank; they are then broken into smaller blocks, then split into sheets of required thickness. For that purpose a chisel or knife about 18 inches long, resembling a large putty knife, is used. The slate splits readily whenever the knife is put in if inserted when the block is wet or "green," as it is called. The workmen speak of the original moisture in the slate as "sap." After the blocks are dry they harden and cannot be split. After the blocks are split the sheets are dressed or trimmed with a machine to the required size, which is from 6 inches by 12 inches to 14 inches by 24 inches; they are then shipped to all parts of the States and to the Old World, and a great deal goes to Australia.

Slate, Slite, Slote, Slitten.

Of late years it has been common to say that a book severely reviewed has been "slated," and to call the review a "slating." This has produced the jocular phrase, a "slating with slates." In the September 1891 number of the *Author*, Professor Skeat solemnly rebuked all such as do vainly talk of "slating with slates." And now we may jest with a good conscience. Mr. Skeat asserts that the verb "to slate" is the causative form of "slite," or rather "slitan," the strong verb of which the modern "slit" (once "slitten") is a weakened form. *Slitan*, *slat*, *sliten*, or as Mr. Skeat writes it for the modern public, is what should have been its modern form had it survived *slit*, *slote*, *slitten*, signifying to tear, to rend. An excellent good verb, a most expressive verb, and if anybody will restore *slote* and *slitten* to our *slit*, which lives all weak and forlorn, we shall be delighted.

Slate, says Mr. Andrew Lang, is noun first and verb afterwards; and the noun is originally *slat*, a narrow board of wood with which a person might be beaten. Even nowadays we may hear of the slats of a bedstead.

Marston, the dramatist, who lived in 1600, wrote:—

How did you kill him? Slatted his brain out.

"Slate" is nothing but a special application of the French *esclat*, a splinter or chip. The Elizabethan and still living "slat," a board or lath wherewith one may be beaten, is obviously the same word not yet fully specialised. And so with slats, but not with slates, "books that bin evil written, by doom of the most equal fates shall evermore be slitten."

The Liverpool Architectural Society recently issued a circular letter proposing the formation of an organisation for the promotion of beauty and dignity in the city's development. A large number of replies have been received signifying accord with the movement. Among them are the Liverpool Academy of Arts, the Garden City Association and Liver Sketching Club. The preliminary arrangements will be shortly completed.

CONCRETE BLOCKS.

A REPORT has been prepared by a special committee of the National Fire Protection Association of the United States, which says:—

During the past year there has been a great increase in the use of cement in building construction or, more broadly speaking, in the use of concrete construction of various forms. Engineers, architects and builders are becoming more and more familiar with the material and are now more nearly in agreement on general principles of design and method of handling (from a purely structural view-point) than ever before.

The rapidly extended use of concrete for a great variety of purposes, such as embankments, bridges of intricate design, reservoirs, standpipes, sewerwork, grain tanks, coal bins, piers, fence posts, railroad ties and buildings or almost any part thereof, even including shingles, has naturally resulted in bringing to the study of the subject a great many men of ability, and has called forth interesting and instructive discussion in the Press and in conventions, all of which is tending toward more uniform and intelligent practice of the art, and is rapidly reducing that hitherto widespread and well-founded objection of uncertainty as to quality of material and workmanship entering into a concrete structure. This important objection has by no means been entirely removed, and we are still far from perfection in matters of design and workmanship. However, a very gratifying progress has been made, and the average concrete building of to-day is much less open to criticism on this point, and is a correspondingly better fire risk, than the building of a few years ago.

Your committee has endeavoured to participate in this general education and has collected much data of various sorts, and now has plans under way for more thorough and original investigation on various phases of the subject, chiefly through our connection with the work of the structural materials testing laboratories at St. Louis, where extensive tests are being made under the direction of a general advisory board, comprising representatives of the United States Government, various engineering associations, the National Board of Fire Underwriters and our own Association.

This St. Louis Laboratory is an established and well-equipped institution, maintained chiefly by the Government through the Geological Survey Department, and is engaged among other things in the examination of Portland cements and concrete of various sorts. They are at present at work on a series of hollow concrete blocks, which will soon be tested by fire at the Underwriters' laboratories in Chicago, the result of which will be published in due course. Pending the completion of these tests we are not prepared to recommend a definite standard for hollow concrete block construction, but a brief review of conditions relating to this particular part of the subject may be of interest as a part of this report.

The use of concrete blocks has rapidly increased until now they are common in practically every part of the country, and there are at least one hundred, and probably more, kinds of machines on the market for making blocks of one sort or another. These machines are, in effect, simply adjustable moulds made of metal into which the prepared concrete in its wet condition is placed and tamped down either by hand tools or by a pneumatic machine. As soon as the blocks are formed they are removed from the machine or mould and set away to harden, a practice which necessitates using a concrete mixture which is dry enough to retain its form from the very beginning before the cement has begun to set. It must not be too dry, however; there must be enough water to properly hydrate the cement, and the difficulty of correctly determining the amount of water so that the cement will all be thoroughly moistened, but will not be too wet to stand up on removal from the machine, is a serious matter for inexperienced manufacturers. After being formed these blocks are laid away in a shed or open yard and allowed to harden for about a month and are then laid in the wall in practically the same manner as stone.

These blocks vary in size from small pieces for corner and other trimmings up to blocks of 12 by 36 inches, and from 8 to 12 inches in thickness, and generally have a thickness of 2 to 3 inches of shell all around.

There are several quite distinct types of block in use. Hollow blocks with a single air space or cell are the most commonly used, and are the type for which a very large proportion of the machines are designed. Similar blocks, but with two parallel cells, are also used, and claim an advantage over the others of being less liable to transmit

moisture from outside to inside of wall. A so-called "two-piece block," with which the outer and inner shells of the wall are built of separate pieces, is claimed to be more moisture-proof, and it is asserted that the position in which this sort of blocks can be moulded allows the use of a wetter mixture, and consequently a denser and therefore stronger and better appearing product.

Another style of two-piece block has metal tie-pieces inserted as the block is being formed, to hold the outer and inner walls in their proper places.

Another quite different type of block is commonly called "cast stone." These blocks are made in plain or ornamental form by pouring very wet concrete made of cement and finely crushed stone into a sand mould, where it is allowed to harden a day or two before removal. This method produces an excellent imitation of natural stone, and allows the duplication at a low cost of ornamental blocks for cornices, columns and other decorative portions of buildings, which if carved in natural stone would be very expensive.

Blocks of all these types except the last one are quite generally faced on the outside with a richer mixture of fine sand and cement in the proportion of 2½ or 3 to 1, for the purpose of rendering the block more waterproof as well as to improve its appearance.

Waterproofing is also accomplished quite satisfactorily by the use of various special preparations which are added to the concrete as it is mixed.

Various colours are imparted to concrete by the mixture of certain mineral pigments, which, with proper care, are made to produce pleasing effects and do not appear to have a bad effect on strength or durability.

Thoroughly satisfactory methods of both waterproofing and colouring are still undeveloped, and the possible effect on the fire resistance of the block of treatment for these purposes is somewhat uncertain, though no serious objection on that score has developed thus far.

Another feature of block making which is still in process of development is the best method of curing or ageing them. The common way has been to store them in a shed or open yard for a month or so and sprinkle them with water once or twice a day to prevent too rapid drying at the surface. Recently some manufacturers have practised a quick method of curing by placing the blocks in a tightly closed receptacle and subjecting them to live steam under considerable pressure.

On account of lack of experience of their manufacturers the concrete blocks as found to-day throughout the country vary largely in appearance, strength, waterproof quality and doubtless also in fire resistance. Some of those examined by members of this committee have every indication of being strong and durable and at least the equal in fire resistance of natural limestone, but many others appear very porous and weak, and some which have been submitted to members of this committee for fire tests have actually disintegrated in the course of a few months while waiting for trial.

The form in which most of these small blocks are made involves a certain weakness under severe temperatures which, while by no means fatal to the fire-resistance, places a limitation on that quality which must be recognised, viz. they are subject to breakage by unequal expansion under heat the same as is hollow tile or any other similar hollow material. Hollow blocks of concrete or tile as set in the walls or floors of a building usually present only one surface to the direct attack of fire, and the consequence is that that side or face of the block expands readily and irresistibly under the influence of the heat, while the other three sides, receiving much less heat, do not expand nearly as rapidly, with the result that the hottest side breaks away from the others. This has been demonstrated in actual fires and experimental tests for both concrete and tile. Failure from this cause would naturally occur soonest in blocks having a thin shell, inasmuch as the thinner the shell of the blocks towards the fire the more quickly it will heat through and consequently expand. This breaking by unequal expansion has sometimes been referred to as a bursting due to pressure of steam or gases generated in a large hollow space or cell of the block, but a very brief analysis of the conditions will easily disprove any such statement. In the first place there is generally no means of getting water into the interior of a block and no probability of gases from other sources being introduced therein, but if it were possible to get gas or steam into the interior, these cells are so continuous in a wall or floor and have so many vents to the atmosphere at the top

of the wall or through mortar joints that the accumulation of the number of pounds' pressure necessary to burst an ordinary small block would be an impossibility under working conditions.

As already stated, this committee does not feel justified in presenting a standard for concrete blocks until the investigations now under way are completed, but shall hope to do so in another year; in the meantime trust the foregoing brief review of the progress of the art may be of some interest.

REGENT STREET IMPROVEMENT.

THE Building Act committee of the London County Council, in their last report, say that they have had under consideration an application made by Mr. J. Murray on behalf of the Commissioners of Woods and Forests for consent to a proposed rearrangement of the building lines on both sides of Regent Street between the northern end of the Quadrant and Oxford Circus. The scheme involves the ultimate rebuilding of nearly the whole of the houses and shops on both sides of the street, and the widening of the street to a uniform width of 85 feet throughout. It was originally proposed to alter the existing frontage lines in some of the side streets leading out of Regent Street and also in Oxford Circus, but the applicant has at the request of the committee agreed to adhere to the existing frontage lines with the exception of certain specified projections which may be allowed under the provisions of Section 73 of the London Building Act, 1894, and wherever possible to round off the corners at the ground-floor level at the junctions of the side streets with Regent Street. The applicant has also undertaken to recommend the Commissioners to consider favourably any suggestion which may be made by the Westminster City Council with a view to facilitating any future widening of Argyll Place, Chapel Court and Beak Street. The following statement shows the general effect of the scheme in Regent Street:—

	Sq. Feet.
<i>Area of land to be left open to the public—</i>	
Land now occupied by buildings of more than one storey	1,436
Land now occupied by one-storey projections	2,034
Land now occupied by forecourts, of which 386 square feet is either enclosed by railings or raised above the footway	4,893
Total	8,363
<i>Area of land to be covered by buildings of more than one storey—</i>	
Land now occupied by one-storey projections	6,407
Land now forming part of public way	44
Land now occupied by forecourts	43
Total	6,494

The consent of the local authority will be necessary to the proposal to build upon the small areas now forming part of the public way in Regent Street and in the side streets; but inasmuch as the scheme has been generally approved by the Westminster City Council it will probably not be difficult for the applicant to obtain this.

It will be observed that a considerable area of ground at present covered by one-storey projections will be built upon to the height of the main buildings; but on the other hand it should be noted that one of the results of the scheme will be the reduction of the area at present occupied by buildings by about 3,400 feet. Having regard to this fact and to the importance of the proposed widening and rectification of the lines of the street, the committee think that the Council should consent to the application, and they recommend—

"That the Council, in the exercise of its powers under Section 22 of the London Building Act, 1894, but in no way otherwise than under such section, do consent to the erection of main buildings on the eastern and western sides of Regent Street, between the Quadrant and Oxford Circus, to the red lines shown on the plan, dated June 16, 1906 (Registered No. S.A. 32730), submitted with the application of Mr. J. Murray, on behalf of the Commissioners of His Majesty's Woods and Forests, such consent being subject to the following conditions: that no projection other than cornices as permitted by Section 73 of the London Building Act, 1894, be erected or made in advance of the buildings on either side of Regent Street and Oxford Circus; that as and when any of the proposed buildings are erected the

whole of the land in front of such buildings in Regent Street and any of the side streets be left open for the use of the public, and that no pier, pilaster or other projection be placed on such land; that no vault, arch, cellar or other construction be made in or under the said land coloured blue on the said plan without the previous consent in writing of the local authority; that the existing lines of main frontage in all the side streets be adhered to in the erection of the proposed buildings; that no projection other than two-storey shop fronts of the projection permitted for shop fronts by Section 73 of the said Act be erected or made in advance of the existing lines of main frontage in the side streets; that each of the angles of the proposed buildings at the corners of the side streets be rounded off to a quadrant with a radius of not less than 5 feet; that no buildings be erected upon any portion of the public way without the consent of the local authority having been first obtained thereto; and that the buildings be erected in exact accordance with the application for the consent, and with the plan and particulars which accompanied such application."

TESTING A TIE-BAR.

THE following interesting account of the process which Mr. W. G. Kirkaldy had to adopt in order to determine the cause of the fracture of the tie-bar of the Charing Cross terminus is appended to the report of Major Pringle, inspecting officer of the Board of Trade:—

I received first the west end fracture of the tie-bar and afterwards also the east fracture with a moving coupling attached. I was asked to make examination tests. First I examined the bright fracture. It had to me every appearance of a weld and of being defective in the centre part. There is a trace of cinder in the very centre of the fracture. I felt that although it had all the appearance of a weld I must keep an open mind and endeavour to prove conclusively that it was a weld. There was, perhaps, I thought, some other explanation of it. The line of fracture is at a blunt angle, and that is one of the reasons why I considered it likely to be a weld. I cut off the bright fractured bar about an inch behind the actual point of fracture, I then took a piece off the stump end that was left and treated it with acid. This showed to me the method of manufacturing the bar. There were eight slabs of iron piled one on top of the other. This constituted the bar itself. On the face of my cut nearest the fracture I found, after treating it with acid, there was a disturbance in the layers of iron which made the bar, and it appeared as if this was a continuation of the line of what I considered was the weld. This disturbance was not visible at cut No. 2, which simply showed the marks due to the piling of the rod. The disturbance shown on the cut nearest the fracture strengthened my idea that the fracture had taken place actually at the weld. I still had to bear in mind that although this was evidently a weld it might not have been an intentional weld. I thought that if it had been an intentional weld I should find traces of a similar weld at the other end of the bar near the coupling; on the other hand, if it was only a chance weld the other end of the bar would not show any sign of welding. The result of my first careful examination of the exterior of the other end of the bar was that I could find no sign of any weld. Then I cut off about 20 inches of the bar and turned a portion of it in a lathe. After reducing the diameter in the lathe considerably, I found distinct traces of a weld. The result of this examination in a lathe was to prove to me that the bar was of set purpose welded at both ends. I thought it was quite possible for the smith to have set up both ends of the bar from the solid for the screw ends, but having found welds at both ends I thought it was clear that, owing to the length of the bar (about 18 feet), it was not possible in those days to turn the bar in a lathe, and that for that reason the screw ends were first of all manufactured and these ends then welded on to the bar. When I had an opportunity, before making these tests, of seeing the ironwork that had fallen, I examined several of the bars very carefully, but could find no signs of any weld on any of them, and this was the reason that, though I had made up my mind that the actual fracture was at a weld, I was concerned to find out whether it was a chance weld or an intentional one. I obtained from the engineer of the company several additional bars with which to continue my investigations. In the case of the three bars that I examined, by scraping off the rust down to the clean surface of the metal, I found at one end only of each of the bars

traces of a weld. The marks were 1 inch to $1\frac{1}{2}$ inch in length, and had the appearance of a raised fibre on the surface. In no case was there anything of a crack at the weld. I failed altogether to get any trace of a weld at the other end of each of these bars. I turned off a portion of the metal in a lathe, and I then found the mark of a weld on the bright surface of the metal that was exposed by the tool, but in no case was there any visible crack or cavity. The result of the examinations that I made of these bars clearly proved to me that they all had welds at each end. Possibly, therefore, it is a fair inference that all the other tie-bars in the roof were similarly manufactured, for until I had examined these other bars there was always the possibility that the welds in this fractured bar were due to chance only. Looking at the west fractured end of the bar, the clear crystalline portion was solid at the time of fracture. This bright metallic surface was approximately the upper side of the bar in position. I think that in addition to the bright surface the remainder of the discoloured surface round the circumference was at some time or other also in contact and adhering. I gather this from the fact that this discoloured portion has still a sharp grain when touched, and in addition to this you can see spots here and there on the circumference and nearer the centre of a metallic brightness. The actual centre of the bar has a different appearance, and has evidently never been in contact. This portion is defined by the ash which surrounds the core, and the core itself has a smooth undulating surface with a fire skin on it. The iron of which the bar was made may be described as good quality iron. I cut out two round iron test-bars from the bar that broke, about 6 inches behind the fracture, and tested these for tension. These two bars broke under an approximate tensile stress of about 20.6 tons per square inch. The contraction of area in each case was over 40 per cent. The solid portion of the bars had all the character of new iron. There was no sign of any deformation or deterioration due to fatigue. The result of a number of measurements of the circumference of the bar that broke showed that 4.4 inches would represent the mean diameter. The waste due to rust or corrosion amounted therefore to one-tenth of an inch on the mean diameter. I made other tests of the metal surrounding the weld at the other end of the broken bar, and found generally the same results, namely, high tensile strength in the solid portions, and nearer the centre, where the welding was less perfect, the tensile strength diminished, until quite in the centre where the cavity existed there was no tensile strength. I tested two other tie-bars after reducing the areas in a lathe to 8 square inches, and found that the breaking tensile stress of these two specimens, each of which contained a weld, was 11.15 and 12 tons respectively on the square inch. In these two cases there were similar pockets to those found in the tie-bar which broke. Two other specimens, also amounting to 8 square inches of the central portion of the bar, broke at 14.1 and 17.3 tons per square inch respectively. The fracture in these cases was also through the weld. In these four cases the metal that was turned off in the lathe to reduce the area of the bar was in each instance sound and good. I do not think any heat such as would be necessary to burn off paint would have any deteriorating effect upon the quality of the iron of the tie-rods. I think that the centre portion of this tie-rod was never in contact. I am sure that if the outside of the bar had been scraped clean, it would have been impossible to detect the bad flaw when it was in position in the roof. I could discover none of the places where the rods had been welded in my laboratory until some of the metal had been turned off in a lathe, and then there was only the indication afforded by the shadow on the metallic surface. I do not think it would have been possible to discover the bad weld in the fractured rod by tapping. If the bars had been sent to me for examination and general report I should have said they were in excellent condition as regards welding. By this I mean I should not have known there were welds in the bars. The examination that I made of the broken tie-bar, and of the others which were subsequently received by me, was one that it was quite impossible to have made in the roof. I am quite certain that if I had been called upon to examine this particular broken tie-rod before it snapped, and as it was placed in the roof, I should not have been able to discover that there was anything to be suspicious of. I should not have found any crack or opening on the surface. The development of the flaw has occurred from the interior and not from the exterior.

COAST EROSION.

HIS Majesty the King has graciously approved of the appointment of a Royal Commission to consider certain questions affecting the erosion of the coasts of the United Kingdom. The Royal Commission is to inquire and report:—(a) As to the encroachment of the sea on various parts of the coast of the United Kingdom and the damage which has been or is likely to be caused thereby, and what measures are desirable for the prevention of such damage. (b) Whether any further powers should be conferred upon local authorities and owners of property with a view to the adoption of effective and systematic schemes for the protection of the coast and the banks of tidal rivers. (c) Whether any alteration of the law is desirable as regards the management and control of the foreshore; and (d) whether further facilities should be given for the reclamation of tidal lands.

As announced by the Prime Minister on Monday, the members of the Royal Commission are as follows:—The Hon. Ivor C. Guest, M.P. (chairman), Sir William H. Browne Wilkes, Sir Leonard Lyell, Mr. William Matthews, C.M.G., Mr. W. Phipson Beale, K.C., M.P., Commander G. C. Frederick, R.N., Mr. H. Rider Haggard, Mr. T. J. Jchu, M.A., professor of geology at St. Andrews University; Mr. A. L. Lever, M.P., Mr. R. B. Nicholson, town clerk of Lowestoft; Mr. Patrick O'Brien, M.P., Mr. T. Summerbell, M.P., and Mr. A. Stanley Wilson, M.P.

Mr. Charles H. Grimshaw, of the Board of Trade, to whom all communications should be addressed, will act as secretary, and Mr. Daniel R. Daniel as assistant secretary.

TESSERÆ.

The Perpendicular Style.

TOWARDS the end of the fourteenth century a great change came over the architecture of this country. It began to decline, and this change first manifested itself, as indeed was likely, in the feature which more than any other was characteristic of all the styles—the window. The graceful, flowing lines of Decorated tracery began gradually to lose their elegance and freedom, and to become more and more rigid and stiff. And this stiffness was not confined to windows, but soon spread over every detail, waving lines being exchanged whenever possible for perpendicular ones; hence the very appropriate name assigned to the style by Rickman—Perpendicular. The date at which this came into general use was the year 1377, or perhaps a little earlier. But, as was the case with the previous styles, the sign of transition—in this case the Perpendicular line—had appeared some years before. The earliest instance known of a Transitional church is the very remarkable one of Edington, in Wilts, which was consecrated in 1361. It was built by William de Edington, Bishop of Winchester, and some have supposed that his successor in that see, the famous William of Wykeham, taking the idea from Edington's innovations, invented the Perpendicular style. Whether this theory be true or not, this much at least is certain, that Wykeham was the greatest architect of his day, and that his own foundation of New College is the earliest pure building of the style. It was begun in 1380 and finished in 1386. But to return to the church of Edington. It is Transitional throughout, not merely showing signs of a change here and there, but begun and finished within the period of transition; in general design and effect Decorated, in detail a remarkable mixture of the two styles between which it stands midway. For instance, the west window, which is large and of eight lights, appears at a distance to contain Decorated tracery, and the Perpendicular lines are scarcely noticed though they occur at every opening. This is probably accounted for partly by the fact that not one of the mullions is carried up into the head of the window, and thus, the Perpendicular lines being broken and scattered, the idea of perpendicularity is only imperfectly expressed. The doorway beneath exhibits a still more singular mixture of styles. The arch is segmental as in ordinary Decorated work, but the upper part, forming a kind of tympanum over two doors, is filled with Perpendicular panelling, and the whole is surmounted by a square hood-moulding, which is of very unusual occurrence in Decorated work, though a similar example occurs in the north aisle of Dorchester Abbey Church. William de Edington began and Wykeham continued the alteration of Winchester Cathedral, and although the new works are, of course, in the Perpendicular style, at least those of the former prelate are not

wholly free from traces of the preceding style. In 1380, however, we find the new style thoroughly established and the flowing line of the Decorated period utterly abandoned.

Bernard Palissy.

Originally Bernard Palissy was a glass painter, and seems to have followed that profession, at all events, till 1538, when he married and settled in the city of Saintes, the chief place of his native district, in the south-west of France. Thenceforth his attention was directed to the potter's art, owing to the accidental sight of a fine enamelled cup of some foreign manufacture. Of whatever ware this cup may have been, whether oriental porcelain, Persian faience or Italian majolica, it seems almost certain that Palissy's pottery, as ultimately perfected and currently produced, bore little or no resemblance to it. His multifarious experiments were apparently made entirely in ignorance of previous ceramic traditions or experience, the limited knowledge of the technique of vitreous enamels, acquired by the practice of glass painting, being probably his only starting-point. It is evident from some passages in Palissy's writings that he at first aimed at producing a white glazed ware suitable for decoration with the most brilliant colours, but in this he did not succeed; he probably, indeed, after a time abandoned the intention, for his works are evidence that he never even became acquainted with the common stanniferous enamel covering of the majolica wares, which, nevertheless, was in common use in most parts of Europe in his own time and had been known from a much earlier period. Palissy's pottery is as original and peculiar in style as that of the unknown contemporary of his earlier period, the potter of Henri Deux, betwixt whom and Palissy there does not seem to have been any direct communication. The probability is that Palissy did not see any specimen of Henri Deux ware till his own fabrication had been brought to a successful issue. It is not unimportant to remark that there was no novelty whatever in either the clay body, glaze or enamel colours of either of these artist-potters, all of which had been known and in use for centuries before both in Italy and perhaps also in Germany. Palissy, at all events, however, was unaware of this fact, and consumed years of time and took an infinity of trouble to rediscover for himself what the humblest potter of Faenza or Urbino could have taught him in a single day. In technical respects, indeed, the French potters were but the merest tyros by comparison with their Italian brethren, whose processes and results, exhibited in the endless varieties of their enamelled earthenwares, are at this day unrivalled and unapproached. The real and great merit of both the potter of Henri Deux and Bernard Palissy is the admirable taste and originality in design of their famous wares.

Mediæval Tapestry.

Guicciardini asserts that tapestry was invented in Flanders, by which we presume he would mean that the Flemings first introduced into Europe the art of weaving tapestry, which had been previously manufactured by the needle only. As early as the ninth century it existed in France, when the term *tapetia* becomes of frequent occurrence, and at the close of the tenth century we are told that tapestries were woven in the abbey of St. Florent, at Saumur. The fashion of hanging the walls of cathedrals and churches with tapestry on great festivals prevailed so much in the eleventh century that it was denounced as a vanity by the Cluniac order of monks, notwithstanding it had received the sanction of a saint, Gervais, abbot of St. Riquier, who had some remarkably fine tapestries made for that especial purpose. In 1025 the city of Poitiers, in France, was celebrated for its manufactures of tapestry. In the twelfth and thirteenth centuries the art progressed rapidly in consequence of the increasing demand for a material which clothed the cold, comfortless stone walls of the castles and mansions of the nobility, and not only gave warmth and cheerfulness to the chamber but frequently illustrated the actions of its owner or his chivalrous ancestors. The tapestries of Flanders were in great repute as early as the twelfth century; but although England was celebrated long previously for her wonderful needlework—so much so, indeed, that all peculiarly fine embroidery obtained the name of "English work" (*opus Anglicum*)—it does not appear that any successful attempts were made to introduce the weaving of hangings in this country, whilst manufactures were successfully established at Brussels, Antwerp, Oudenarde, Lisle, Tournay, Bruges, Arras, Florence and Venice. Of all these that of Arras appears

to have shortly become the most famous, and, indeed, almost substituted its own name for that of its production. Arras became in England synonymous with tapestry, and *Arrazzi* in Italy signified the most perfect description of this manufacture. The famous royal tapestry manufactory of the Gobelins was established by Louis XIV., who purchased the premises belonging to some eminent dyers of that name about 1666, and the productions of the Hôtel Royal des Gobelins are said to have attained their highest degree of perfection in the time of Louis's great minister Colbert and his successor Louvois.

John Cozens.

The father of the water-colour artist was a native of Russia, who was for years a teacher of landscape-drawing and was professor of drawing at Eton College. It is no mean compliment to the talent of John Cozens to know that Turner and Girtin have admitted that the contemplation and the copying, indeed, of some of his best works, opened to their minds that intelligence of effect in representing distant scenery which they adopted, and subsequently excelled in to so much greater a degree than their ingenious prototype. Cozens certainly was the first of the school of water-colour painting who exhibited a right feeling for art. His effects were washed in from the scenery which he beheld at once upon the spot. Hence, though his drawings for the want of that knowledge of the power of the pigments used with gum water, which all were then deficient in, were comparatively weak, yet by his mode of practice they were more natural and effective, and consequently more approved of by the eye of taste than any of the most laboured works of his predecessors. The process with which this artist wrought may be quoted as the foundation on which Girtin and Turner placed the lofty superstructure. Varley, indeed, is entitled to share with these distinguished artists in the honours of the achievement, for many of his landscape compositions, descriptive of the mountain regions of Cumberland, Westmoreland and North Wales, produced about the same period, were rendered with that truth and simplicity of pure aerial tone united with more vigour of effect, which, derived originally from the same source, expanded into a greater style of art by applying the theory to his intelligent and sedulous practice from nature. Cozens compounded his cloud tints and those for his distant mountains of Indian red, a small portion of lake, indigo and yellow ochre; in the middle distance he blended a tint of black; and his foregrounds were principally of black and burnt umber. His distant trees were tinted with the warm washes used for the sky, and those of the nearer than middle distance with yellow ochre and indigo enriched with burnt sienna, the immediate foreground trees and shrubs with the same rendered one or two degrees stronger. Girtin retained more of his manner and touch than either Turner or Varley, but in the early works of each, in scenery of the aforementioned character, much of the style and feeling of John Cozens is observable. Of Cozens's works generally it may be observed that his process amounted in effect to little more than tinted chiaroscuro. The same may be said, advanced a step further, of the early mountain drawings of his imitators; for that splendour of effect which they ultimately attained was the result of much subsequent ardent study and reflection.

Architects' Plans and Provincial Authorities.

SIR,—Architects outside of London have not the advantages for getting their plans ultimately approved when they have been wrongly disapproved by the local authorities possessed by their more fortunate brother professionals in the Metropolis in respect of having a tribunal of appeal conferred under the London Building Act, 1894, Section 175, and constituted as follows:—"One member shall be appointed by the Secretary of State, one member shall be appointed by the Council of the Royal Institute of British Architects, and one member by the Council of the Surveyors' Institution, and no member or officer of the Council shall be a member of the tribunal of appeal."

The decisions of the said Council under the above Act are frequently altered and varied by the said tribunal of appeal, and the question arises why should provincial

architects labour any longer under this great disadvantage to themselves, and inflicting serious monetary losses on their clients? This could be obviated by amending the Public Health Acts, giving power to local tribunals of appeal (similarly constituted) to deal with all matters connected with new buildings, streets and drainage (together with discretionary power to modify provisions of any acts and by-laws if deemed advisable by the majority). This is a favourable time to do this, as the Public Health Acts are now under the consideration of a committee appointed by the House of Commons.

At the present time, when plans are arbitrarily disapproved by a provincial authority, there are only two courses open to the client to take. The first is to go to the King's Bench Division to obtain a mandamus to compel the authority to approve the plans, and the second is to lodge the plans and give notice of intention to commence to build without such approval. The first process is costly and the second is objectionable, as proceedings would be instituted in the police-court.

To illustrate this, in my own experience a few years ago I had submitted plans to an authority for the erection of one house on a small estate, and they would persist in applying certain sections of their by-laws in reference to new streets, notwithstanding a decision in the High Court of Justice which laid down that the erection of one house did not constitute the laying out of a new street. My client not caring to instruct a solicitor to obtain a mandamus, he commenced to build the house. When it was 10 feet high proceedings were taken by the authority in the police-court, and although the summons was dismissed with costs, it was not a pleasant ordeal to undergo.

In an architect's practice vexed questions are constantly arising. For instance, a local authority disapprove a plan for bringing forward a gable of a corner shop lower down a street, whereas at the top of the same street a similar bringing forward of a gable of a corner shop is permitted. Technically, power is possessed under the third section Public Health Act, 1888 (Building in Streets Act), although not discriminately used. I had another case where plans were passed by an authority greatly to the detriment of the health of the tenant of the adjoining owners' property by allowing a two-storey building to be erected on the party yard wall only 4 feet distant from the opposite scullery wall, thereby interfering with the frontal rays of light and air to the window of same, and to the lateral rays of light, &c., to the kitchen window at right angles to the said yard wall.

It is cases like this that bring by-laws into disrepute, particularly where the angle of 45 degrees is rightly enforced at the rear of new houses, and also where insanitary houses are dealt with under the Housing of the Labourers' Dwellings Act, 1890, and local sanitary Acts. There are also frequent cases arising of local authorities trying to compel owners of houses to repair and reconstruct what they term "drains," whereas the incorrectly called drains are sewers, and repairable by the local authorities.

If there was a local tribunal of appeal it would be a great boon to architects and property owners, where decisions and actions of authorities could be equitably dealt with and revised without having recourse to costly or objectionable procedure.—Yours, &c.,

JOSEPH H. M'GOVERN.

Liverpool: June 29, 1906.

GENERAL.

The Late Sir Wyke Bayliss, aged seventy, of Clapham Park, president of the Royal Society of British Artists and F.S.A. and president of the Birmingham Ruskin Society, left estate valued at 2,640l.

The British Academy at their fourth annual meeting elected the following Fellows:—Messrs. R. H. Charles, D.D., W. J. Courthope, C.B., J. Fitzmaurice-Kelly, Andrew Lang, A. A. Macdonell, John McTaggart Ellis McTaggart, Edward Moore, D.D. (Canon of Canterbury), and G. F. Warner, Keeper of Manuscripts, British Museum. The number of Fellows is now ninety-four, out of a maximum of one hundred allowed by order of the Council.

Mr. J. J. Webster, M.I.C.E., of Westminster, has been appointed engineering expert in connection with a projected vehicular bridge over the river Ouse, in the neighbourhood of Goole, now under consideration by a joint committee of the East and West Riding County Councils and the Goole Urban Council.

Lady Betty Balfour, at a fête to raise funds for the erection of a new church at Woking, went to a brickmaking stall, where she moulded a brick, upon which she inscribed her name. The brick will be used in the building of the church.

The Church of All Souls, Leicester, has been formally opened and consecrated. The new church has been designed by Mr. G. F. Bodley, R.A., will accommodate about 700 worshippers, and has cost over 10,000l.

The Committee for the Fine Art Section of the Irish International Exhibition, which will be opened in Dublin in May 1907, is to be made up as follows:—Mr. A. G. Temple, F.S.A., director of the Guildhall Gallery (chairman); Sir Charles Holroyd, director of the National Gallery; Sir Isidore Spielmann, hon. secretary of the St. Louis Exhibition; Mr. Lionel Cust, M.A., M.V.O., director of the National Portrait Gallery; Mr. C. F. Corbould-Ellis, chairman of the art gallery committee of the Corporation of London; Mr. G. J. Frampton, R.A.; Mr. Philip Norman, F.S.A., treasurer of the Society of Antiquaries; and Mr. Whitworth Wallis, F.S.A., director of the Birmingham Gallery. The exhibition will comprise a selection of works by British and foreign painters during the last fifty years, and of water-colours, works in black and white, miniatures and architectural drawings, and a special display of British sculpture.

Mr. A. G. Temple, F.S.A., curator of the London Corporation Art Gallery, is producing, under the title of "Early Flemish Art," an illustrated catalogue of the pictures now being exhibited at the Guildhall. The exhibition will close on the 28th inst.

Mr. J. Murray Macgregor, C.E., Morpeth, Northumberland, has been appointed surveyor for the county of Sutherland at a salary of 300l. per annum.

Several Subscribers have presented upwards of 300 drawings and studies in water-colour, chalk, pencil, and pen and ink by Sir John E. Millais, Ford Madox Brown and Frederick Sandys to the Birmingham Art Gallery. They form part of the same collection which was bestowed in 1903. The Birmingham Gallery now possesses more than 800 drawings of the English pre-Raphaelite school.

An Exhibition of Pictures was opened at the Hampshire Social Club, Hampshire House, Chiswick, on the 29th ult. The members of the club already number 150, and are chiefly of the labouring classes. An art class has been established. The exhibition contains Watts and Burne-Jones drawings and works of Sir W. B. Richmond, Messrs. Charles Shannon, Francis Dodd, W. Rothenstein, G. Clausen, M. Bone, J. Paterson, A. E. John, H. S. Tuke, F. Brangwyn and Miss Dacre, and a fine flower-piece by Mrs. Nelson Dawson.

The Glasgow Archaeological Society, which was founded in 1856, proposes to celebrate its jubilee this year by a dinner in November. Mr. John Honeyman, LL.D., was the first secretary of the Society. The other original members are now few in number, but the Society of recent years has attained a membership which makes it rank as one of the leading learned societies of Scotland.

The Royal Scottish Academy, presided over by Sir James Guthrie, P.R.S.A., have had before them the Government proposals regarding the housing of art institutions in Edinburgh. It was unanimously decided to give the hearty support of the Academy to the Secretary for Scotland in his efforts to improve the present situation, and to support the Bill at present before Parliament, subject to the recognition of the Academy's rights in the building it now occupies. It was also decided to send, as requested by the Town Council, three representatives—of painting, sculpture and architecture—to the provisional committee organised by the Town Council.

A Collection of stained glass, including specimens from Flanders and France, has been presented to Durham Cathedral.

The Building Committee of the Portsmouth Board of Guardians reported at the last meeting the unsafe condition of the joists supporting a large water-tank at the children's home, and recommended that Mr. G. E. Smith, architect, should be requested to furnish a full report as to its condition and the best means of effecting its security. One of the members drew the attention of the Board to the fact that the recommendation was not unanimous, and quite contrary to the principle advocated by some, that the architectural work should be equally divided amongst the professional men of the town. After some discussion the recommendation was sent back for further consideration.

The Architect.

THE WEEK.

THE progress of Newcastle-on-Tyne can be judged by the works which were opened this week by the KING and QUEEN. All were costly, but not one penny has been derived from taxation. The high-level bridge, which has cost at least 580,000*l.*, was designed by Mr. C. E. HARRISON, and carried out by the Cleveland Company. In it 5,782 tons of steel were used. In the high-level bridge which the late QUEEN opened in 1849, and which ROBERT STEPHENSON designed, required 4,728 tons of cast-iron and 327 tons of wrought-iron. The cost was 243,000*l.* But STEPHENSON'S bridge consisted of six spans of 125 feet, while in the new bridge are two spans of 300 feet, one of 231 feet and one of 191 feet. The new bridge is more expensive than STEPHENSON'S, which, although mainly of cast-iron, has sustained heavy traffic for nearly sixty years, and is still in sound condition. The Armstrong College, designed by Mr. W. H. KNOWLES, is an extension of a building which has done much for technical education, and will under new conditions be still more useful. The new infirmary building, of which the architects are Mr. LISTER NEWCOMBE and Mr. PERCY ADAMS, is a memorial of Queen VICTORIA, and has cost about 250,000*l.* The statue of Queen VICTORIA, which is the gift of Sir RILEY LORD, is the work of Mr. FRAMPTON, R.A.

A JUDGMENT has been given in the French courts which suggests that industry has now a claim to recognition, which would be disregarded some years ago. The Place Vendôme used to be an ultra-respectable part of Paris, and seemed to be assigned to high officials. It was, in fact, a privilege to live there. Accordingly, an advocate agreed to pay 6,000 francs a year for a small pavillon which was attached to one of the solemn buildings. His landlady occupied the ground floor with the first and second floors. In course of time there was a change in the proprietorship, and the three floors which used to be used by the former landlady as a residence were let to a dressmaker. Occupants of apartments in the majority of Paris houses have to put up with many varieties of neighbours, but the Place Vendôme differed from an ordinary street. The advocate, who knew the law, brought an action because he was injured by the alteration of the character of the house. The Tribunal of Commerce agreed with him, but an Upper Court has decided that the advocate's rights as a tenant were not of a kind which gave him power to interfere with the appropriation of the other premises. After this decision we may expect to find the most aristocratic quarters of Paris invaded by tradespeople.

It is rare for anything which could be considered architectural to be made the subject of a patent or registration, and to receive protection from the Law Courts. The case of STAPLE *v.* WARWICK has therefore a professional interest. Eiffel towers at one time seemed to be the rage, but Mr. STAPLE designed a structure which would serve similar purposes and be otherwise attractive in an insular country. He called it "The Helter-Skelter Lighthouse," and took the precaution to register his design. Instead of being drawn up by a lift, visitors were able to ascend by a spiral road and staircase on the exterior, that was so arranged that they could slide down if they desired. Those who ascended were rewarded by an extensive view, and there was fun in descending quickly and safely by the aid of their own gravity. The defendant also began to erect an iron tower. Mr. STAPLE, believing it was an infringement of his design, applied for an injunction, which was granted. The defendant changed his structure from a lighthouse to a castellated building with overhanging battlements. Mr. STAPLE then applied for the

committal of the defendant, as his building was a breach of Mr. Justice BUCKNILL'S order. Mr. Justice PHILLIMORE acceded to the application. The defendant appealed, and the case came before the Master of the Rolls and Lord Justice COZENS-HARDY. Their Lordships allowed the appeal and set aside the order for committal, which they said ought not to have been made. Their Lordships held that as there had been no trial of the action, the question of infringement remained undecided. It might turn out that there was no breach of the injunction, and therefore no act of contempt. The Court would not allow the defendant to be put in prison for an act that probably was not a crime. The plaintiff will have to pay the costs. At present the case does not appear to be encouraging to those who think that every cottage they erect should be protected by law.

PREJUDICES take a long time to be dispelled, especially when they arise in modern corporations. Mr. DE COURCY MEADE, the engineer to the Manchester City Council, lately prepared a report respecting pavements, in which he explained how he had ascertained by experience that excavating work carried out by the Corporation staff cost more than similar work done by the unemployed; that, as a general rule, the work done by the regular staff is not measured up and the time is not so kept that the actual cost can be accurately ascertained; and that the cost of excavating work done by the regular staff averaged 156.83 per cent. more than the cost of work done by contractors. These conclusions, although they were incontrovertible, were not acceptable to the paving committee because they were supposed to cast an unwarranted reflection on the members and their staff. The subject was considered at the meeting of the Council last week, when it was proposed that the paving committee should present to the Council a report showing the actual cost of the work carried out by the staff and the estimated cost of such work if done by contract. This also was supposed to be unfair towards the committee, but it was decided upon by a majority of the Council. The case is another example of the absurdity of the theory that workmen who consider they are privileged beings will be more active in carrying out corporation works than men employed by an ordinary contractor.

THE British Museum is one of the most valuable institutions in the world, and THACKERAY was in a pious mood when he said that in the reading-room he could feel as grateful to Providence as in any cathedral. But that institution has set a bad example by paying salaries that are not commensurate with the services rendered. Keepers of departments may receive as much as a head clerk in a merchant's office. But the rank and file of the assistants are not adequately rewarded. Enthusiasts are always ready to sacrifice themselves, but it is not quite fair to take advantage of such a spirit. One consequence is that the curators of museums throughout the country are treated like ordinary workmen. Dr. HOYLE, the Director of the Manchester Museum, has had the courage to speak out on a subject which has concern for all with a desire to see the technical education of the country advance. In Germany, as we have often pointed out, there is a regular organisation, and men who are intelligent and active are sure of promotion. In this country retired Royal Engineers had at one time the best chance of office, owing to the influence of the South Kensington precedent. The requirements for office are indefinite, although no class of men require wider knowledge than the curators of museums. Dr. HOYLE suggested that the museums should follow the German system and train curators. But he has to admit that the prospects for an official are not inviting. The salary commonly offered is from 100*l.* to 150*l.* a year. As in other affairs, money has to be considered, and if, as Dr. HOYLE says, committees wish to have a superior article they must pay the price for it.

JULES BRETON.

ANOTHER of the old school of French painters has vanished, and it may be a long time before a true successor to him shall arrive. Born in 1827, JULES BRETON may be said to have commenced his life with Romanticism. His nature was complex and easily disturbed. At the cost of severe headaches and what might be called a bouleversement of his system, he was able to write short poems about the country life he loved so well, but when painting he could stand at his easel for ten hours at a stretch without the least sign of fatigue. Yet there can be no doubt he preferred the art which gave him vertigo. As a pictorial artist it was only natural that he should adopt the easier course and represent things with pencil in colours rather than describe them in words by his pen, although he believed the poet alone was king of the world. Still, there is a peculiarity about his paintings which can only be described as a trace of poetry which could easily be translated into verse by such a man as LECOMTE DE LISLE. The painter who was able to say that although the features of his mother could not be recalled by him, yet that in the stars he was able to see her eyes blessing him and guiding him, must have been possessed of a sentiment which was out of keeping with the prosaicism of the nineteenth century.

As we have said, he was born in 1827. He was the child of peasants, and his birthplace was at Courrieres (Pas de Calais). If we may judge by the numbers of portraits of women in peasant costume which are to be found in the ateliers of Paris, it would be reasonable to conclude that a great many artists have sprung from that class, and, indeed, men appear proud to avow the fact. The peasant's life, as ZOLA has described it in "La Terre," is one of the hardest and most prosaic, and it may be supposed that men like JULES BRETON represented a feeling of reaction against the sordid everyday slavery on the part of their mothers. JULES BRETON could never be accepted as a realistic painter. The figures in his landscapes are peasants rather than the nymphs and goddesses which COROT and others of his contemporaries preferred to introduce, but his landscapes have sometimes a brightness, sometimes a haze, such as are not to be seen on sea or land.

JULES BRETON and J. F. MILLET have been often contrasted as if they represented the two poles of rural life in France; both had, however, much of the idealist in their nature. MILLET was, perhaps, more pessimistic than JULES BRETON, and he could impart a sense of melancholy to which JULES BRETON was indifferent. It is remarkable that both went through a course of training which was adapted to make them figure-painters in the academic style. MILLET studied with PAUL DELAROCHE, DROLLING was the master of JULES BRETON. It is needless to say that the latter had to go through the curriculum of the Ecole des Beaux-Arts, but, fortunately for himself, he never gained the Prix de Rome or he might have attempted the so-called classical landscape. But before his Paris teaching he had the advantage of two or three years study in Belgium.

His first efforts were with historical scenes. He was converted to a more rational method of exercising his talent by ARY SCHEFFER. Timidly he went to consult that fashionable painter, to whom he displayed a large study which he had completed, and which when produced on canvas was to take the Salon by storm. It represented the ghost of a woman appearing at night to her murderer and pointing to the fatal wound in her breast. The assassin was shown recoiling in a manner that was derived from the great masters; his eyes and mouth were open to an unnatural extent, his arms and neck were stretched forward and every muscle was properly displayed; the moon was introduced, and on the occasion illuminated the room with a blue light, and a bat appeared as an additional accessory. SCHEFFER was the Court painter at the time, but he remained tranquil before the terrible scene. His only remark was, "Take care to avoid sketching any sort of action unless you

have seen the equivalent in nature." The words were worth more than a course of lectures to BRETON. By 1853 he had realised that he was not adapted to ambitious subjects. *Les Glaneuses* was described as a scene in Courrieres, and the poor women, young and old, who are represented as returning through the fields with their scanty sheaves of corn, were probably portraits of peasants with whom he was acquainted. That might be called a sentimental scene. The *Lendemain de la Saint Sébastien* is of a different character, and suggests the rough humour of French villages. It represented a guild of archers visiting the taverns accompanied by musicians, and recalls the English mummings scenes at the close of one year and the beginning of another. He received a third-class medal in 1855, a second-class in 1857 and a first class in 1859; in 1861 he was admitted into the Legion of Honour. From this regular progression it will be evident that JULES BRETON was appreciated, and that his success was due to the general character of his works and not to some painting which was a surprise to amateurs and officials.

From the descriptions which he gives of his own youth, JULES BRETON must have been in his early days deeply impressed by the scenes around him; indeed, he regretted that young children were not competent to express the forms and the colours of things which gave them pleasure. He tells us that his first recognition of a dawn worked a revolution in his mind; he felt disturbed by the mystery which seemed to awaken him to thoughts about the unknown. The belief in the companionship of an angel guardian was also advantageous to him. A flight of birds when first observed with attention made an impression on him which he always remembered. Atmospheric phenomena excited his wonder, and the first eclipse he saw filled him with terror. Then with flowers, the different stages of growth became as marvels. The humble processions and other ceremonies of the Church were also as influential as any Renaissance spectacle, and he used to walk solemnly in his garden imagining he was one of the officiants. "How many times," he exclaims, "have I been throughout my life the plaything of my imagination. Chimeras," he adds, "have taken from me a part of my life, but I owe to them a thousand joys and a thousand troubles." Indeed, he found it difficult to distinguish between realities and fictions. The descriptions which JULES BRETON gives of peasant life enable us to understand some of the qualities of his pictures. He lived, as he said, amidst adorable mirages; sometimes he has introduced them in his pictures, but if not visible the scenes will gain in effect if we suppose that we are looking at them through a mirage.

His early days amidst simple men and women might be supposed to have made a hardy youth of him. Coming into contact with nature, he could not fail to derive a belief in reality, but, strange as it may appear, his own experience in boyhood was the cause of much pain to him afterwards, especially when he found himself before a picture which appeared to be false in any respect. He relates that one time, when he was a student, he stood before a painting which was in the place of honour in an exhibition in Brussels. It represented several ladies in a drawing-room, but, when compared with the women he had known in life, they seemed to be no more than puppets. His whole being rose in revolt against so much falsity, and in the effort to restrain himself he became so weak that if a seat had not been near him he must have fallen on the floor. A visitor took compassion on him and led him into the air, where he gradually recovered. As he was liable to similar attacks it was risky for him to visit picture galleries, yet we suppose he never gave a thought to the sufferings of critics who have in the way of business to stand without losing their self-control before worse pictures than that of the Antwerp master.

A psychologist would find the life of JULES BRETON and his records of impressions to afford excellent subjects for investigation. Throughout his life he was

fascinated by the tranquil beauty of rustic scenes, while whatever was melodramatic filled him with aversion. On that account, although he had an atelier in the Boulevard de Montparnasse, he preferred to live and work in some part of the country with which he had become familiar. He was, therefore, able to point out the exact spot where he was inspired with a subject. His *Sarclouses*, or weeders, was derived from an actual scene which he observed one evening, and he therefore maintained that the painting was made complete by nature. The largeness of the lines, the intensity of effect, the richness and simplicity he saw with his own eyes. Not one detail was disturbing, not a tone interfered with the harmony. It was a transfiguration of honest toil. He said he never felt so near the Almighty as when looking at the scene, for then he realised that labour was a prayer. The influence of education is suggested when we find that BRETON, after he was first recognised by the principal critics of the Paris press, resolved to show his gratitude by producing a masterpiece. The painter of peasants studied HOMER, ÆSCHYLUS, SHAKESPEARE, and attempted figures of Druids, Vercingetorix and other heroes of the schools. Then he thought a course of the nude was indispensable, and for that purpose went to Ghent. When he saw the pale creature before him, he thought of the hale and vigorous women who laboured in his native fields, and he went back to see them and was cured.

Another time he imagined he heard Italy inviting him, and as he could not resist the voice he left France. LEON GOZLAN had initiated him beforehand into the way works by the great masters are produced. He was, therefore, cautious in admiring, and it was characteristic of him that he found more delight in the chapels of Assisi in their mystic slumber than in Venice or Florence. He was at first disappointed with Vesuvius, but he found compensation through the works of MICHEL ANGELO and RAPHAEL in the Vatican. Just as VICTOR HUGO declared that NAPOLEON lost the battle of Waterloo because Heaven was jealous of him, BRETON must also show himself to be a Frenchman by saying that MICHEL ANGELO struggled with the Creator, and that his works were a protest against the original weakness of the human organism. When we read such remarks it becomes more evident that BRETON's proper place was among the labourers of the field.

It is unnecessary to make an inventory of JULES BRETON's works. Almost every year gleaners, potato gatherers, reapers, shepherds were to be seen from his hand, and they were all equally delightful. Each could be easily recognised, and no lover of pictures could consider the painter was producing too much. There was no doubt he was extremely sensitive to the beauties of nature, but his own idiosyncrasy was a factor in what he produced, and they are fortunate to whom the fields sometimes appear as poetic in aspect as always to JULES BRETON.

SCIENCE IN SOUTH AFRICA.

IT appeared strange to many people when it was announced that the seventy-fifth meeting of the British Association for the Advancement of Science was to be held in South Africa. Prior to 1897 the annual meetings were in towns of Great Britain or Ireland. In that year Toronto was selected as the place of meeting, and in 1905 a still longer journey was undertaken to South Africa, and there were meetings at Cape Town and Johannesburg. A volume of the reports and papers has been published, but it was inevitable that the pages could not represent the whole of the proceedings. Papers, for instance, which have appeared in *The Architect* are only mentioned. The reason for omissions probably is that more importance was attached to communications from members at home, or who belonged to the party of visitors, than to those by local contributors.

The future of South Africa, according to the notions which now prevail, is closely connected with science. Few emigrants from Great Britain will care to emulate the Boers in farming and other agricultural pursuits. The desire at present is to make mining profitable, and to attain that end the aid of chemistry and mechanics is indispensable. The labour problem is so difficult that if it were possible mining owners would give it no attention, and the more science enables managers to dispense with the assistance of foreign or other miners the better it will be, not only for shareholders, but for the peace of this country. There were several papers read in the sections of chemistry, geology and engineering which had application to the mining industry. If the papers in other sections cannot be considered practical by managers they were at least interesting, and may lead those who have to live in South Africa for a longer or shorter period to turn their attention to the study of science.

It was shown by Dr. A. C. HADDON, the president of the section of anthropology, that students of that most modern of sciences have a wide field for investigation in South Africa. Those who have lived in India are aware that the least advanced of the tribes speak of a people whom they regard as savages, of a much lower type than their own, and who have been found living in small groups of families apart in the most dense interiors of forests. To the Zulus the Kattea are dogs or vultures, the lowest of the low. Their habitations are holes in the ground, rock shelters, and lately a few hovels were found. They have no arts or industries, nor even any weapons except those obtained in exchange for ostrich feathers, skins or ivory. Their language has not been mastered by any European, and it is therefore impossible to say what their ideas are about the world in which they live. Compared with them the Bushmen appear almost civilised, for they can make portable dwellings for themselves, which are dome-shaped and covered with mats. Their agriculture is simple, for an advanced operation consists in digging up roots by the aid of a stick which they turn in a hole perforated in a stone. Sometimes they are capable of producing coarse pottery. These poor Bushmen can, however, give a lesson to some of our modern exquisites. They are almost indifferent to personal ornaments, but their pictorial skill is applied in decorating their rock shelters with spirited representations in colour. They also erect cairns over graves. In them we have a curious correspondence with the races who, in prehistoric days, etched elks and other animals on bones in various parts of Europe. There are other tribes which may be said to indicate the degrees in the civilising process which affects all peoples.

Dr. HADDON pleads for the introduction of an Ancient Monuments Protection Act for South Africa, with officers to carry out the provisions. He would jealously preserve the pictures of the Bushmen to which we have referred. In the eagerness to obtain gold, not only were ancient workings destroyed, but no implement or other evidence was left which would enable us to determine who were the miners. But Dr. HADDON admits that preservation would be a costly undertaking. According to him, "the number of the ruins in Rhodesia is so great, and the area within which they occur so enormous, that it would be a very large undertaking for the Government systematically to investigate and permanently to conserve them all. Perhaps it would be possible to entrust some of this work to properly constituted local authorities, assisting them by grants and special facilities, but care would have to be taken to insure the thorough carrying out of the work. Records of work done should be published, and the specimens preserved in authorised museums only."

It is remarkable, although no more than was to be expected under the universal law of progress, that South Africa should have had its stone age, and that implements

have been found which correspond with those met with near the Pyrenees on one side and Madras on the other. What is difficult to understand is how implements which weighed $9\frac{1}{2}$ lbs. could have been used by a race so small as the Bushmen. Stone weapons were used until a comparatively recent period. Another survival is the bow of the Damaras, which is still used as a musical instrument, for it is believed by archæologists that the modern harp has been derived from a primitive bow, which enabled the warrior to accompany his song of triumph. There are other musical instruments in Africa which may also be related to those used in civilised countries.

Mr. D. R. MACIVER, who read a report on the ruins of Rhodesia, said there could be no doubt that the strange remains were the work of a native race closely akin to those at present inhabiting the country. To identify this race would be a task well deserving of the efforts of investigators. So far from considering that this new conception of the origin and date of the ruins destroyed a romance, Mr. MACIVER maintained that they were far more interesting now that they proved to be not a parasitic growth from Arabia, but products of South Africa itself. Their history is the past history of Rhodesia. But if the workers were of South Africa there is no objection to the supposition that Semites carried the gold that was produced to distant lands or that a part was deposited in SOLOMON'S treasury. It is still possible to combine romance and reality with the elliptical hill forts, the Parallel Passage, the fortifications and the other wonders at Inyanga, Niekirk, Umtali and Zimbabwe.

One of the most interesting of the reports relates to the progress of the geodetic survey; it was prepared by Sir DAVID GILL. In such a work the first step is to measure a line which would be of sufficient length to serve as a base for the subsequent triangulation. In 1752 the Abbé DE LA CAILLE endeavoured to measure the arc of the meridian. The terminal points of his base could not be identified in 1840 and a new triangulation was necessary. In 1859 Captain BAILEY, R.E., was ordered to make a survey of the southern coast of Cape Colony and British Kaffraria. The surveying party having completed their field work in 1862 returned to England, where the plotting could be executed. The vessel was wrecked and the instruments, field books, &c, were lost. Sir DAVID GILL was appointed in 1873 as astronomer at Cape Town, and he shortly afterwards took up the subject. By slow degrees he was able to persuade high officials to co-operate with him and to lay down a system of triangulation over various parts of the country. For a time the late CECIL RHODES gave no more than verbal support. Characteristically he considered that roads, bridges and other works should be first executed. Subsequently he promised to provide funds to carry on the survey and his promise is respected by his representatives. Fifteen base lines have been measured, the longest having a length of 71,165 feet, or over 13 miles. It is believed that with the majority of them the probable error is about 1:1,000,000. Great credit is due to Colonel MORRIS, who has been engaged for ten years in the field and one year in office work.

The progress of Johannesburg is at a quicker rate than elsewhere in South Africa. It was founded twenty years ago and has now a population of 160,000. The rateable (capital) value is nearly 40,000,000*l.* The Town Council have large powers, and possess the water, gas, electric light, tramways and other undertakings. In both Johannesburg and Cape Town it is evident there is a desire to emulate American buildings. Mr. WILLIAM LUCAS, who read a paper on the architectural problem, declared that nepotism and social qualities—far more than is possible in older and more extensive communities—rather than merit have much to do with the character of South African architecture. The public buildings, however, are generally the results of open competition, and more fully express the possibilities of

quality and the extent of "the force behind the hill" panting for its opportunity.

The low standard of building may be traced to the circumstances which surround the South African in his youth. It was stated by Mr. WAV, professor in one of the African colleges, that there are few beautiful school buildings in the country, and, as he insists, there is consequently little habitual training in that fine sense of artistic proportion which has made the Japanese Empire what it is to-day. If a boy's school associations are to be of an ill-paid schoolmaster, of a playground 10 yards square filled with old papers and broken rubble, of an oblong rectangular building covered with cracked and dirty plaster and roofed with corrugated iron, his imagination, his feelings, his sympathies will suffer. In other words, until architecture is recognised as an essential civilising agent there is not much hope of South Africa becoming a great nation.

When we remember the part of the world with which the latest volume of the British Association transactions is identified there is much that is hopeful in the pages. It was arranged that 1,000 copies are to be distributed at the expense of the South African Association. The circulation of so many copies will have, no doubt, a beneficial effect, and it may therefore be possible that whenever the British Association will again meet in Cape Town and Johannesburg to have all the papers contributed by observers who can claim to be residents.

ARCHITECTURAL PROBLEMS.*

IN architecture light and air exercise a potent influence, not only on exterior design, but on the planning of buildings. The intense heat of the sun and its brilliant light justified the peristyle and porticoed buildings with their small windows of ancient Greece and Rome, and the wide structural verandahs of the remoter east, but in the colder and darker north, and particularly in our seagirt isle, all artificial obstruction to the sun's rays has to be avoided, and large windows become a necessity for comfort and for the sanitary occupation of buildings.

This occupation is sometimes lost sight of, and it may be pardoned if I lay stress on the necessity of designing all kinds of buildings from within rather than from without. In other words to take care that the exterior, so far as fenestration is concerned, shall express and grow out of the internal requirements of the building. To sacrifice the interior in order to get an external effect is insincerity in architecture. It means inconvenience to those who use the building, and results in unsanitary conditions prejudicial to body and mind. Appropriateness in design is the correct aim in art, and this arises where the design is the natural and ordered outcome of the purpose for which the building is intended.

In the dwelling-house of the wealthy and middle class this principle of design is not so frequently overlooked, but it is not uncommon in towns, both in these and in poorer dwellings, to see the neglect of such simple rules as that windows should be so disposed that all parts of a room shall be well illuminated, not only because light is the great germ killer, but because it serves to point out impurities otherwise unnoticed; that the tops of windows shall be as near to the ceiling as possible, and that windows should be made to open wide, so that all parts of the room may be scoured by currents of fresh air.

Through ventilation of rooms and of buildings is again of great importance to prevent the accumulation of vitiated air in any part. We must see that other provision than that of open windows is made for the entrance of fresh air and for the exit of foul air. To this end we should provide inlet ventilators of a simple type, and outlets into upcast flues. In theatres and factories where large numbers of people are assembled the constant passage of fresh air through the enclosed space and the removal of foul air, vitiated by the capillary and respiratory emanations as well as by gas, are of the greatest importance. How frequently are consumptive patients improved in health by treatment under hygienic conditions, only to relapse when they return to the un-

* From the address by Mr. Edwin T. Hall at the opening of the Section of Engineering and Architecture of the Congress of the Royal Sanitary Institute at Bristol on Wednesday.

sanitary conditions of their normal employment in some factory where these conditions are neglected, where as was shown in the report of Dr. Scott Haldam, F.R.S., and Mr. E. H. Osborn, C.E., to the Home Office in 1902, the carbon dioxide is sometimes so excessive as to be a source of grave danger to the healthiest persons.

But I have also noted that light and air dominate the planning of buildings, and particularly the block planning of large buildings where health is of primary importance, such as hospitals and schools.

The old-fashioned type of hospital, with which we are familiar, the square building around an enclosed area, is the survival of a very old type of plan, which had its origin in a remote past, in the necessity for defence of life or of privacy; a type carried on in Mediæval times, surviving in the courtyard of many an old hostelry.

It possessed the one advantage of concentration, but concentration has its limitations. The old hospital, consisting of a heaped-up block of many storeys, was concentration beyond reason—reduced to a logical but unsanitary imperfection. This type in the spread of the science of hygiene has given place to the open plan, to the principle of open air circulation everywhere, of sunlight to all external walls and windows, of open prospect for the inmates themselves.

This open plan type brings me to the mention of sanatoria, which for many years have been erected in large and ever-increasing numbers all over the civilised world. Here in England they have been in recent years developing in number and usefulness. They are not merely the temporary abodes of consumptive patients as hospitals for recovery from diseases; they are great colleges of hygiene. Not the drug but the personal influence and disciplinary instruction of the medical staff are the great instruments for removing the ravages of the disease and rehabilitating the weakened fibre, both physical and mental. But to enable that influence and instruction to be given the architect must make the sanatorium a model, an object lesson of what a sanitary building should be. Hence it is that he should lay out his scheme on broad lines, design so as to give to all rooms a maximum of sunlight, direct and reflected, so that floor, walls and ceilings may be illuminated, and while the windows face the sun, he must give ample openings in the inner walls that air may freely pass through, that even when there is no wind the difference of temperature on the hot sunny side may induce currents from the cooler side. There must be no blind corridors ending in blank walls, but all must be well aerated and illuminated by sunlight. The assembly and dining-rooms must also be designed on similar lines, and no reservoir for stagnant air should be tolerated. Again, however large the building a sense of security from fire must be felt by all patients, however nervous; hence means for escape from fire must be carefully considered and be in evidence. Everywhere facilities for cleanliness must be evident—cleanliness of the habitation and of the person. I endeavoured to give effect to all these views in the Frimley Sanatorium for the Brompton Consumption Hospital, opened two years ago by H.R.H. the Prince of Wales, and since then two other sanatoria of exactly the same number of beds have been opened, that for the North London Hospital and the King's Sanatorium at Midhurst, recently opened by His Majesty.

A residence in such a school of hygiene cannot but have its influence on all, rich and poor alike; and they will all go forth to preach and talk of what they saw and learned and of the results to those who lived under such conditions. But it will be said all cannot go to such places. True; but all can be and are influenced by those who are so privileged. Even in cities, in the hospitals and infirmaries similar conditions and similar educational advantages may be obtained. Wards and flat roofs may be designed and utilised for the treatment of consumptives. At Camberwell Infirmary we made the experiment of such design and utilisation, and the medical superintendent, Dr. Keats, informs me that the results are most gratifying, and will bear comparison with those in sanatoria.

I cannot but think that the public guardians of the health of the poor in towns might with great advantage follow this precedent, and so bring home to the denizens of crowded towns the same lessons which are taught in country sanatoria. I suggest that our large hospitals under private management might specially fit up some parts of their noble institutions for this particular method of treatment, and become schools of hygiene in a very special sense.

There has been a good deal said and written lately as to rural by-laws and their effect on housing the poor. The

fact is we in England are slow to move, and when we do move we too frequently go to extremes.

In the general consideration of better house construction it was legitimate to bear carefully in mind the danger from fire in cities and towns, and to insist on using materials that were fire-resisting, and the Local Government Board did a great service in preparing model by-laws, so as to insure some uniformity throughout our urban districts. On the creation of rural sanitary authorities the question of sanitary building construction came up of necessity for consideration, and frequently, for want of knowledge, it was assumed that the local board could not do better than adopt (sometimes with practically no modification) the model by-laws. These, however, were never intended as hard-and-fast rules applicable everywhere, but as models on which local authorities might work as a text. In the result rules that were reasonable in towns were unreasonably adopted and insisted on in hamlets, and the cost of housing the poor was greatly increased. It is reasonable to insist (and as sanitarians we should insist) on damp-courses in the walls, on preventing ground-air from passing into rooms, on sound drainage and its ventilation, and on preventing water pollution; but beyond these essentials a great many of the present requirements for cottages are not only unnecessary but are deterrent of building, and so the agricultural labourer is driven away for lack of residences.

In the recent exhibition of cottages at Letchworth there was nothing very new in design or illuminating in construction, but such exhibitions are stimulating.

From housing the workmen to housing those who are past work is a natural transition, and I should like to say a few words on what is a national question. This is no place for discussing politics, but the unemployed and unemployable are with us, and we must take care that we do not let legitimate sentiment for unavoidable and temporary distress obscure our vision and lead us into the fatal mistake of pauperising large masses of people. The subject is no new one, but has been before our forefathers for centuries, and the Legislature has attempted again and again to grapple with it, notably since the reign of Queen Elizabeth.

From various causes there have always been large numbers of idle people—some from no fault of their own, many from choice. We are apt to think it a modern result of the vast increase of our population, of the advance of civilisation, but the proportion of indigent persons to population is far less now than when England was sparsely populated.

It would take almost a volume to discuss the subject of the relief of the poor, but we are familiar with what are still called workhouses, with infirmaries and asylums. With the last two classes of admirable philanthropic institutions I do not propose to deal, but I should like to throw out for consideration the possibility of an improvement in the principle and type of workhouses. Would it not be possible to grade our homes for the indigent classes? At present the worthy aged poor who have done their honest life's work, and those who from lack of employment are temporarily indigent, are associated with the thriftless, the idle, and the otherwise unemployable. Could we not separate these three classes? Instead of one large workhouse to contain all, could we not have a home for the worthy aged poor, another for the temporarily unemployed and a third for the other class? The last to be a real workhouse, whose inmates should be under discipline, compelled to work, taught to work and to earn their living where they lack the knowledge, and all made to learn that they have a duty to the community as imperative as that of the community to them. As they learn their duty and become employable they should be entitled, when necessity arises, to claim the right to reception into the higher grade home for the unemployed, and if misfortune should fall on them in their old age should know that they will be ultimately received into the highest grade home for the worthy aged.

It will, of course, be asked, "Will not work so done compete with that done by wage-earners outside?" But I think if their work were confined to supplying the needs of the three classes of homes it would be a fair and reasonable employment.

Now, as architects we can assist the authorities in the design of such buildings as are suitable to these classes, each one differing in its characteristics from the others. Attempts have been made to classify inmates of present poorhouses. I suggest the classification of the houses themselves.

In the field of building construction the use of steel is

now and will probably become more and more general, and, for a reason that will be presently touched on, its modern application affects the salubrity of our cities. The practice of a skeleton of stanchions and girders rivetted and bolted together to carry all the weight, merely clothing these with brick and stone, is a type of building now commonly seen. The San Francisco fire has demonstrated one great advantage of this form of structure. This consists in the fact that all parts are of one metal tied and bound together; whereas in a building with walls of stone or brick, relying for their stability principally on specific gravity and gravitation, and only held together by an earthy material of comparatively small tensile strength, supporting horizontal supports of other materials, there is manifestly less cohesion, and any disturbance of the foundations will produce greater damage or destruction of the fabric than in the other structure. Reinforced concrete is the latest evolution of steel used in combination with cement and concrete. Its strength has been demonstrated; but I feel that one danger lurks in it, and that is the effect of fire and water on it. Slight piers of the material are used for very large loads, and should a fire play directly on these piers the cement will, I fear, crack, letting in moist air or water, which will oxidise the steel and destroy it. I have heard of reservoirs constructed of the material where this result has happened, and the rust has burst the concrete. In reinforced concrete the strength lies in the perfect combination and cohesion of two materials. If this be interfered with, collapse must follow, for neither the steel nor the concrete alone is of adequate strength to support the load easily carried by their combined strength.

Steel-framed construction has evolved the skyscraper of twenty or more storeys, and, however interesting this may be as a feat of engineering and permissible in isolated cases, its general adoption as a means of expansion of floor area would be an unmitigated evil in our streets, shutting out all sunlight and creating deep channels for wind currents. Already the overcrowding arising from unreasonable concentration has produced great evils and taught its lessons.

In the broader aspect of sanitation we have to consider the laying out of our towns and cities. With electricity and other auto-motor means of transport we may spread ourselves out, give more air-space about our buildings, leave open squares, gardens and parks as oases in the desert of buildings, to the advantage of all, to the brightening of our lives and the refining of our tastes; to the broadening of our ideas and to the stimulating of our creative faculties.

The benefits of such an expansion to the appearance of our large towns are hardly calculable, but the greatest of these would be in the incentive it would give to local patriotism, to creating a pride in one's environment, because it is something of which to be proud. No one who visits Paris or Vienna can fail to feel the breadth and stateliness of the open spaces and boulevards, and the same sentiment is awakened at Edinburgh. When our black country towns become white, and the enlightened policy of our modern municipal councils has cut wide and noble thoroughfares through what were the dens and alleys of their cities, we shall be able to point with pride to these great centres not only of wealth, but of taste, stateliness and culture.

In conclusion, may we also press on the public at large to take care that new buildings shall be worthy of our towns and cities; that there shall be a real desire to get good architecture to adorn their streets? The Royal Institute of British Architects has been earnestly striving for many years to raise the standard of the practitioners of our art by enforcing thorough training, by making the examinations for young architects sound test of knowledge, but many men (particularly in the provinces) evade these and hold aloof from our organisation on the ground that it is useless for them to toil, because the incompetent man, unequipped by study and having no claim to the title of architect which he assumes, receives the employment which his local friends secure for him without inquiry as to whether the representative body of architects have given him their diploma or not. May we hope that the Institute's efforts will receive the cordial support of all public-minded men, because then we may be sure the standard of architectural art in the public mind will be raised, and competent men alone will be commissioned to see to the adornment of the great centres of industry, of liberty and of throbbing life, which are the glory of our country.

The Governors of Dulwich College have given notice that the picture gallery will be open to the public on Sunday afternoons until further notice from two till five o'clock.

NATIONAL PORTRAIT GALLERY.

THE trustees of the National Portrait Gallery in their annual report state that owing to the congested state of the galleries the difficulty of finding space on the walls for the proper exhibition of recent acquisitions continues to increase, and the attempt to maintain a chronological and historical arrangement of the portraits will soon become unavailing. Portraits, especially those of a large size, have to be hung in most unsuitable places. The trouble caused by the shifting and rearrangement of pictures in the event of new acquisitions adds greatly to the labour and consequently to the expense of the Gallery. The trustees have been in further communication with the War Office as to the future disposition of the site now occupied by St. George's Barracks, but up to the date of the report no reply has been received from the military authorities. It cannot therefore be said that the trustees have any immediate prospect of obtaining the extension of the Gallery which has become of such urgent necessity.

The communication by alarm-bells has now been established throughout the Gallery. A new series of regulations in the case of an outbreak of fire has been drawn up and approved. The work of installing electric ventilating fans in the roof of the main building of the Gallery, which has done so much to mitigate the intense heat experienced during the summer months in the top galleries, has been most satisfactorily continued in the east wing.

The donations, loans or bequests during the past year were:—Rev. Rowland Hill (small plaster bust), George Frederick Watts (painted, unfinished, by himself), Cecil John Rhodes (painted, unfinished, by George Frederick Watts, R.A.), John Arthur Douglas, second Baron Bloomfield (by Sir Thomas Lawrence, P.R.A.), Sir John Walter Huddleston (by Francis Holl, R.A.), Edmund Lodge, F.S.A. (by Lemuel Francis Abbott), Charles Abbot, first Baron Colchester (by John Hoppner, R.A.), Owen Swinny or MacSwinny (by Peter van Bleeck), Henry Fawcett (colossal bust), Sir Cyril Wych (painter uncertain), Sir James Brooke (bust by Thomas Woolner, R.A.), John Addington Symonds (crayon drawing by Carlo Orsi), Dugald Stewart (drawn by John Henning), Thomas Campbell (drawn by John Henning).

The purchases were:—Joanna Southcott (drawn by William Sharp), David Cox (by William Radclyffe, junior), Augustus Welby Northmore Pugin (painter uncertain), Mary Ann Cross, "George Eliot" (replica by M. d'Albert Durade), Tiberius Cavallo (painted probably by John Zoffany, R.A.), Alfred Stevens (plaster cast from mask), Captain James Cook (painted for the Governor of Newfoundland), James Smith (painted by James Lonsdale), Sir John Harman (painted by Sir Peter Lely), Richard Graham, Viscount Preston (attributed to Sir Godfrey Kneller), John Joshua Kirby, F.R.S. (painted by Thomas Gainsborough, R.A.), William Cowper (drawn in crayons by George Romney), Charles Talbot, Duke of Shrewsbury (attributed to Sir Godfrey Kneller), Heneage Finch, first Earl of Nottingham (painted by Sir Peter Lely), Archibald Campbell Tait, D.D. (drawn by Lowes Dickinson), Thomas Love Peacock (painted by Henry Wallis), Sir Hector Munro, K.B. (artist uncertain).

THE LATE F. J. C. MAY.

THE announcement of the death at Hampstead on Saturday morning of Mr. Francis J. C. May, formerly borough engineer and surveyor of Brighton, will be received, says the *Sussex Daily News*, with feelings of genuine regret in many circles in the borough, in which he had a large number of friends, who recognised in him, apart from his professional capabilities, a man of wide sympathies and generous impulses. Mr. May, who recently completed his sixty-seventh year, was the head of an old Kentish family, and was educated at Islington under the Rev. George Darnell, M.A. Articled to a relative who was a partner in the firm of Wm. Cubitt & Co., London, deceased gained his first public appointment in 1872, when he was elected surveyor to Malling Highway Board, Kent, and subsequently to Malling Rural Sanitary Authority. In 1882 he was appointed borough surveyor of Maidstone, and in 1889 borough engineer and surveyor of Brighton, a position he held for a period of sixteen years. He succeeded Mr. P. C. Lockwood, who, singularly enough, resigned his position as consulting engineer only a month or two before Mr. May felt it incumbent to take a similar step, although for a different reason. Mr. May came with the highest credentials from Maidstone, and during his official con-

nection with Brighton the town developed tremendously, and the demands upon him were many and varied. He designed and carried out a number of the most important of its modern works, among them the abattoir, destructor, sanatorium, technical school, swimming bath and extensive main drainage and sea-defence works, and the remodelling of the town hall and market and the free library buildings.

His association with the Corporation practically terminated on March 25, 1905, though his resignation was accepted at a meeting of the Council on March 2, 1905, when it was resolved that his resignation, which had been tendered to a meeting of the general purposes committee on February 24, 1905, should be accepted as from September 29, and that he be granted leave of absence from March 25. His retirement was connected with the unfortunate litigation arising out of the contract for laying tramways, which ended in the town being called upon to pay the contractors 17,500*l.* for work which it was intended should be included in the amount of the contract, but which was claimed as extras. In addition the town had to pay its own costs in the litigation, and Mr. May was held responsible for not calling attention to the fact that the contractors had raised the question of extras before commencing the work, and that they had charged for extras in some early accounts they rendered. At an early stage of the proceedings which gave rise to the litigation Mr. May strongly complained of "unwarrantable and unjust insinuations and innuendoes" made against him by certain members of the Council, and in a special report which he presented to the works committee denied, on behalf of those associated with him in supervising the work, as well as for himself, that there was the slightest justification for them, and called upon the committee to take such steps as they considered necessary to vindicate his honour in as public a manner as the insinuations were made. This was in May 1903, and the conclusion arrived at by the committee was that the statements complained of "were in most cases contrary to fact, that those for which there is any foundation are greatly exaggerated, and that the statements referred to so far as they charge the committee or the borough surveyor with neglect of duty or improper conduct are wholly unjustifiable." There is no doubt that the strain and anxiety of the protracted dispute told greatly on Mr. May's health, and although, following a period of rest after his resignation, he recovered sufficiently to start in private practice at Brighton, he was soon compelled, under urgent medical pressure, to relinquish it. His professional brethren formed a very high opinion of his character and abilities, and the Incorporated Association of Municipal and County Engineers conferred upon him the distinction of electing him President, and also of appointing him examiner in engineering, building construction and sanitary science. He leaves a widow, two daughters and seven sons.

DISCOVERIES IN EGYPT AND NUBIA.

IT has been announced by Mr. John Garstang that the expedition which was despatched in the autumn of last year, under the auspices of the Institute of Archaeology of the Liverpool University, has completed its season's work and returned to England. The objects discovered will be exhibited in the city museums of Liverpool from Wednesday, July 11, until the 26th. The Chancellor of the University, the Earl of Derby, will inaugurate the exhibition.

The explorations of which these antiquities are the outcome were conducted over a somewhat large tract of country, and the objects to be exhibited represent several distinct periods of Egyptian history. In the first place, the expedition resumed its work at Esna, and there completed the excavation of a site which has proved of considerable importance from the historical standpoint, inasmuch as it has provided what is possibly the most representative and complete series of Egyptian antiquities of the Hyksos period. The objects themselves are for the most part of a character which accords well with the provincial situation of the ancient Latopolis; but perhaps from that very cause they will prove of surer value to archaeology in that they illustrate the remains, both domestic and funerary, of the Egyptian people themselves rather than more attractive antiquities fashioned specially for the funerals of great officials or royal personages.

Meanwhile, during the course of these excavations a systematic exploration had been made of the desert lying to the south of Esna for a distance of sixty miles. Most of the sites of antiquities had been very much disturbed, but

it was possible to sift from them certain slight evidences which seemed to bear directly upon the problem of the origins of the Upper Egyptians. Following the clues thus indicated, the expedition moved camp into the heart of Nubia in the hopes of there getting beyond the reach of modern plunderers and of being able possibly to distinguish by an examination of the archaeology of that region those features of the early Egyptian culture which might be considered to be African rather than Asiatic in origin.

Excavations were made at Kubban and at Dakke; at both places something of interest was found, which will be described in a special publication; but the chief interest was awakened by the discovery of an undisturbed necropolis near the ancient fortress of Kostamneh, which lies some five miles to the north of Dakke upon the west bank. Some 200 graves were excavated and a complete record made, with photographs and notes, of every feature of interest which they disclosed. It may be said in brief that in many respects the objects and funereal customs reveal a close analogy with pre-dynastic and early dynastic people of Upper Egypt; but, at the same time, many vases of pottery were found which seemed to resemble more closely those sporadic examples which are found intruding themselves into the Egyptian graves lower down the Nile during the twelfth dynasty or thereabouts, and have been generally attributed by archaeologists to a reincursion of some element of the primeval population. These objects will all be exhibited during the coming weeks; but it is hardly possible to say without further study, indeed without more evidence of a comparative character, to what precise period in Egyptian history these must be assigned.

These discoveries open up a problem of first interest connected with the early days of the Egyptian civilisation. They suggest, in short, that possibly the primitive type of Egyptian culture, as illustrated in the now familiar graves of pre-dynastic and archaic times in Central Egypt, may have survived in these remoter districts of Upper Egypt, not merely into the early historic phase after the founding of the monarchy, but far down into the dynasties, possibly even to the twelfth dynasty or later. These considerations are considerably illuminated by the remarkable survivals in modern Nubia of many small features of the Egyptian civilisation, which is illustrated even by the hairdressing of the girls and the manner in which the bread is prepared for baking.

The exhibition will also contain a series of interesting antiquities discovered during a month's tentative work at Abydos, to which place the expedition removed when the heat in Nubia became too great for further work. In this famous necropolis, from which a distinguished English explorer recently recovered the history of Egypt's earliest kings, there still remains some ten or twelve years' organised and systematic work. The ancient Abdu throughout Egyptian history remained a favourite burying-place for the wealthy and the pious, and much history may be still recovered from its tumbled sands. It is this site that will probably form the centre of our work in the coming seasons.

THE INTERNATIONAL CONGRESS OF ARCHITECTS.

THE Duke of Argyll will take the chair, and the Princess Louise has promised to be present at the inaugural meeting of the seventh International Congress of Architects at the Guildhall, on Monday, July 16. At least 1,500 members, including 600 foreign delegates, are expected to attend the congress, which promises to be the most successful which has yet been held. The arrangements for the week, which have been made by the executive committee, supported by the Council of the Royal Institute of British Architects, are of an elaborate and interesting character. Papers will be read by distinguished members on subjects connected with architecture, possessing in many cases a public as well as a professional interest. Visits will be made to some of the principal buildings in London and to Oxford, Cambridge, Hatfield and Windsor, and an interesting feature will be an exhibition of photographs and models of notable buildings in this country, both ancient and contemporary. A soirée at the Royal Academy, a conversation at the Mansion House, a garden party at the Botanical Gardens and a farewell banquet are included in the programme of what promises to be a busy and delightful week.

The King is patron of the congress, the Prince of Wales hon. president, and the list of vice-presidents is both extensive and distinguished.

NOTES AND COMMENTS.

It needs no small courage on the part of a Scotsman to say a word against anything which is supposed to uphold the greatness of his country. Sir HERBERT MAXWELL has, however, braved all the consequences by saying boldly what every educated visitor to Holyrood must have known from a glance at the walls, viz. that the series of portraits of the kings of Scotland are all shams. Photographs on a large scale of a troupe of actors passing across the stage in the Witches' cave before the astonished MACBETH would have more reality, for they at least would be representations of men, and the Holyrood monarchs could never have been derived from anything living on this earth. They are the results of a contract entered into with one "JAMES DE WITTE Indweller in the Canongate." After the visit of CHARLES I. the palace must have been dismantled. CROMWELL ordered the rebuilding of it. Both CHARLES II. and his brother, who was JAMES VII. of Scotland, took so much interest in the palace it was supposed they intended to use it as a refuge in case of need. The portraits are a relic of that time, for they range from FERGUS I., who was supposed to have lived in the fourth century, down to CHARLES II., who reigned in the seventeenth. We must not be severe in judging them, for the painter contracted to produce the whole series of one hundred and ten within two years in return for payment of 120*l.* a year. He may have had some data for the appearance of the later monarchs, but for the others, if he employed models, they must have belonged to the lowest order of people. Scotland has many relics of the past, and it is not wise to allow it to be suggested that they are not more genuine than the portraits of the kings in the royal palace. The best way to deal with them would be to employ them as elements in a scheme for the decoration of the gallery. For that purpose it would be necessary to reduce the dimensions of each canvas. But the excisions could be executed on a large scale without any loss to art or history. After a tenure on the walls for over two centuries the portraits have some claim to be preserved, but that could be done by making medallions of them, and filling the intervening spaces of them with Scottish ornament.

It is proposed to erect college buildings in Bangor in connection with the Welsh University. At the present time Welshmen are asserting themselves, and they believe that they have some claim on such work. It has somehow got abroad that Welshmen are ineligible to take part in designing the new buildings. The college authorities repudiate any charge of unfairness, and the Carnarvonshire County Council, who are connected with the work, also profess to be in favour of their countrymen. The college committee propose to select five architects, each of whom is to receive a premium, but so far as is known a Welshman is not among them. In a case of the kind experience is essential, and, owing to the peculiar circumstances of the country, Welsh architects have not hitherto been able to prepare plans for such buildings. It would, no doubt, impose more trouble on the committee if the competition were open, but, considering the sensitiveness of Welshmen to anything which resembles unfairness, that course should have been adopted.

If it were desired to occupy the German mind with æsthetic problems in order to prevent them from discussing political defects, it would be difficult to find a better subject than the restoration of Heidelberg Castle. To practical minds it seems strange that sandstone walls which are so thick, and which, although not properly bound to other walls, show no signs of collapse, should be allowed to remain in a ruined state when a comparatively small outlay would make them once more parts of a large and most useful building. That kind of thought is exemplified by the projects which are brought forward from time to time for the restoration of at least some

parts of the building. Heidelberg as a town depends for existence in a large measure on the ruins, for it is in order to wander among them that the majority of visitors travel to the town. There are, of course, many University students, but as they belong to what may be called an institution they do not count like the strangers who come from many parts of the world. A few days ago the townsfolk met and entered into a protest against all restoration projects. Their action may be inspired by selfishness, but anti-restorers in all lands will agree with them. A collection of the German poems which were inspired by the sight of Heidelberg would be representative of the majority of the great poets of the country. And, indeed, some men are only remembered by their verses on the ruins. The discussion of the subject is likely to continue for many years, for, as we have suggested, it attracts German thoughts which otherwise might be turned to more dangerous subjects.

WE have often remarked on the foresight of the French in having models of sculpture, and sometimes of architecture, prepared at full size in order to judge of the effect of the contemplated works when executed. They are not expensive, for sometimes the model consists of only a slight framing covered with canvas, on which for sculpture the figure can be boldly painted. The London County Council propose to have models executed of the two propylæa which are recommended for Vauxhall Bridge. But the cost is to be 440*l.*, a sum which would amaze a French municipal council. As the granite propylæa are estimated to cost 15,400*l.*, it is not considered necessary to have very expensive models. It is said that "in order to withstand the high wind pressure which may be expected, and to provide a structure which might last for several months, each model should consist of a strong wooden staging securely anchored to the top of the existing granite piers. This staging would be faced with slabs of light fibrous plaster screwed to wood studding. The work would be of a special character, and we have therefore consulted a firm which has great experience in work of this description as to the probable cost." The kind of models employed in France are no doubt less substantial, but they endure long enough for the criticism required, and there is no need of wasting money on anchoring as if they were to be permanent structures. Because there is a balance out of the votes there is no need to waste it on structures which are likely to be removed within a year after their erection.

ILLUSTRATIONS.

OFFICES, ARGYLL COMPANY'S NEW MOTOR WORKS, VALE OF LEVEN, N.B.

THE illustrations show some parts of the new offices of the Argyll Company, which were recently opened. They are described in another part of this Journal this week.

HOUSE AT FARRATT.

PROPOSED COUNTRY HOUSE.

WE illustrate the preliminary design for a country house by Mr. J. E. DIXON-SPAIN, A.R.I.B.A. The planning is symmetrical, with a "central hall" motif. The lavatory accommodation is conveniently placed in conjunction with coat-and-hat space, the latter providing storage for bicycles, tennis, racquets, &c. A suite of children's rooms is arranged on the second floor, consisting of a large day nursery with an open-air railed-in balcony, night nursery, nurses' bedroom, &c. The materials will be local stone to first-floor level, rough-cast with red and brindled brick dressings, and quoins above and tile lintels, iron casements with leaded glazing and roof of grey-green Westmoreland slates.

COMPETITION DESIGN FOR PROPOSED CENTRAL LIBRARY, HACKNEY.

CATHEDRAL SERIES.—ST. DAVIDS: WEST FRONT, AND PART OF RUINED COLLEGE OF ST. MARY—EXTERIOR OF LADY CHAPEL.

LONDON COUNTY COUNCIL
ADMINISTRATION.

A *PRECIS* of the evidence relating to the London Building Acts (Amendment) Act, 1905, has been published as a Parliamentary paper. The opportunity was taken to explain how the London County Council has exercised discretionary powers in the past :—

Objection was raised to giving the Council discretionary powers to make requirements, and there was much discussion of the past record of the London County Council in making requirements for means of escape, especially in the exercise of their powers under the Factory Act.

In 1898 the London Chamber of Commerce complained to the London County Council that some of their recent requisitions had been unreasonable, and that to carry them out would render useless for business purposes the premises concerned, owing (1) to the amount of valuable space which would be taken up by making extra staircases or enclosing existing staircases; (2) to the extreme difficulty of extending premises or acquiring additional space so as to comply with the requisitions; (3) to the alteration or removal by the Council's directions of structures, partitions, &c., approved by His Majesty's Inspectors of Factories for regulating temperature or for other purposes. They stated, further, that instances had come to the knowledge of the Chamber when the absolute removal of factories to other premises outside the district in which they had been established for years past had been necessitated or was contemplated through the difficulty of complying with the Council's requirements.

Mr. Riley, the superintending architect, when reminded of these representations, said that he did not believe any removals had been due to the action of the London County Council. Occupiers had left London because it was more convenient and more economical to carry on their business in the country. In 1898 there were 500,000 persons employed in factories and workshops, and he believed there were more employed at present. People naturally complained of the demands of the Council, but on the whole he thought the administration was satisfactory.

Later Mr. Lilley, on behalf of Lilley & Skinner's, stated they would like to move a factory from Bristol to London, but were deterred by the heaviness and uncertainty of the Council's requirements. He admitted that the Council ought to have power in all cases to demand reasonable means of escape from every building in London, and if there were a right to arbitration there would, he thought, be no hardship.

Mr. George Lewis, a solicitor, quoted a case in which a firm who were tenants of his had left a London factory and moved into the country, and had given the demands of the Council as their reason for going. Witness had also found a difficulty in letting property unless he could assure prospective tenants that they would be free from the demands of the London County Council, and sometimes it took months to get a letter from the Council saying they were satisfied with the means of escape. As for expense, Mr. Lewis had spent altogether 13,000*l.* in eleven different sums in satisfying requirements of Council under the Factory and Workshop Act. The total rental of his property was 22,000*l.*, but not all the buildings had been provided with means of escape. The 13,000*l.*, however, includes the expenditure in Redcross Street, where the building was put up, although the Council had refused a certificate under the Factory Act, and the expenditure in Moor Lane.

Mr. A. R. Stenning quoted a case in which the occupier of a pin factory in Tooley Street, employing from 180 to 200 hands, had left premises owned by Christ's Hospital rather than comply with the Council's demands.

Mr. Luke, managing director of Gilbert & Rivington, thought the expense imposed under the Factory Act might have been lessened if the Council's officials had been more willing to consider alternative proposals.

In connection with the complaint of the Chamber of Commerce referred to above, a deputation had waited on the Council, and, as a result, the Council had promised to take into consideration alternative proposals made by owners. Since, then, it was said, the Council had been more willing to consider any alternative proposals instead of going to arbitration.

The Council claimed, however, that alternative suggestions were always considered. It was their practice, before a formal notice of their requirements was served, to send an informal letter setting out their proposals and inviting alternative suggestions.

It was suggested also that the discretion of the Council meant the discretion of the Council's officials, but this was denied. Some members of the Building Act committee have been on it ever since it was established, and they are experts able to examine the architect's recommendations. The committee consists of ten or twelve members, and contains four builders; there are no architects or surveyors among its numbers.

Mr. E. White, a member of the Building Act committee, who was opposed to the Bill, gave evidence that some years ago it was found that requirements which looked harmless were sometimes very costly, and a rule had been made that all cases where the requirements might be considered to entail an expenditure of 300*l.* or more should be reported to the committee before the sealed notices were served.

Some specific cases were quoted in which the requirements of the London County Council were considered to be very costly.

In Redcross Street, on the site of buildings destroyed by fire, new buildings were to be erected, and the Council's demands, it was said, would have taken 20 feet off a frontage of 50 feet, but ultimately, after two years, during which 730*l.* worth of penalties for which they did not dare to press had been incurred, they accepted an additional bridge in lieu of the proposed staircases.

Mr. Riley explained this case to the committee with plans. Before the building was put up the Council made certain requisitions as to staircases. The building, however, was put up in defiance of their demands. To alter it afterwards in accordance with the original requisitions would have cost 4,000*l.* Ultimately, amongst other suggestions, means of access were proposed to an adjoining building (the Council could not have requisitioned such means, as they would have involved trespass), and these suggestions being found satisfactory, the Council did not press for penalties. The suggestion that 20 feet of frontage would have been taken away by the Council's original requisitions was denied.

This case was again referred to later, and Mr. G. Lewis, who owned the property, stated that his original plan for the building had been pronounced by several architects to be satisfactory. Two years were occupied in negotiations with the Council, and ultimately, rather than have any further trouble, he accepted their final proposals, which involved an outlay of 200*l.*, though he thought them unreasonable.

At a house, 21 Moor Lane, it was stated the Council made requirements that would have cost 1,000*l.*, and eventually the arbitrator made an award involving an expenditure of 180*l.*

The Council said their first requisitions might have cost 800*l.* The arrangement finally made was for means of escape by balconies, which they could not have asked for, as they involved trespass on other property. The balconies lead into property occupied by the same firm, and counsel for the promoters suggested that if the owner had proposed this in the first instance there would have been no difficulty. The owner, however, stated that he was led to believe the Council would accept nothing but means of escape by way of a staircase.

The surveyor to the Merchant Taylors' Company quoted a case in which the Council's requirements under the Factory and Workshop Act cost just over 2,500*l.* in a building with a rental of about 250*l.*

Evidence, however, was afterwards given that the rental was 2,000*l.* The building was a big one, with a superficial area of about 6,700 feet, and 223 persons were employed there. The building was old. Two staircases were required, one of teak, and the other an outside iron staircase. Two gangways and many teak doors were required.

The surveyor also mentioned a case in which a private house was taken by a dressmaker, who employed more than forty persons, and the Council's requirements cost 1,200*l.*

Mr. E. T. Hall, vice-president of the Royal Institute of British Architects, mentioned a case in which requirements under the Factory and Workshop Act cost 3,200*l.* It appeared, however, that some extra expense had been incurred in this case by alterations not required by the Council.

In another case the cost was 1,500*l.* Witness had known the County Council staircases cost from 750*l.* up to 3,200*l.* He could give no information as to the rents of the buildings referred to.

Mr. F. J. Ronald, adviser to the Law Guaranteed Trust, mentioned a case in St. James's Court where the require-

ments of the London County Council under Section 63 of the Act of 1894 would cost his clients about 6,000*l.* The requirements were unnecessary, and further the tortuous ladders they were requiring would be the cause of accidents owing to people falling off. He had not gone to arbitration because the building had been put up by a speculative builder, and his clients, who were guarantors to the mortgagees, only became owners after the whole thing was practically arranged.

The Council pointed out that the building was occupied before a certificate was granted under Section 63 of the Act of 1894, and the owner was fined for the offence in the police court.

In the building of Harrod's Stores, the plans of a building which came under the Factory and Workshop Act, it was said, were first passed, and afterwards the Council made further demands, which meant, *inter alia*, the loss of two shop-fronts. An outlay of some thousands of pounds had been involved by their demands.

In reconstructing Swan & Edgar's premises in Regent Street 30,000*l.* had been spent, of which 10,000*l.* was said to be solely referable to the demands of the Council, partly under the Building Act and partly under the Factory and Workshop Act.

The Council, on the other hand, said the fewness of the cases in which there had been an appeal from their requisitions to arbitration showed the reasonableness of those requisitions. Under the Factory and Workshop Act, Mr. Riley had dealt with 2,344 cases, and there had been only eighteen appeals to arbitration, and of these six cases had gone to the High Court. (Cases only go to the High Court on matters of law.)

In all, out of 3,139 cases which had been dealt with under their existing powers, *i.e.* 2,344 factories and workshops, 164 theatres, 499 common lodging-houses and 132 high buildings, there had been only thirty-two appeals of any kind, roughly, 1 per cent., and Mr. Riley claimed that in every one of these cases the requirements of the Council had been justified.

The promoters also referred to a letter received from the Home Office in 1900, in which was the sentence, "Sir Matthew Ridley desires to take this opportunity of expressing his appreciation of the work done by the Council in the administration of these provisions of the Factory and Workshop Acts" (*i.e.* the provisions as to means of escape). Also in the reports of the Chief Inspector of Factories there had been references both by the chief inspector himself and by the London inspectors to the value of the work done by the Council.

One charge brought against the Council was that of delay. One witness said it took three or four days to get an answer from the Council, and sometimes six months to get a definite reply. The manager of Harrod's Stores gave evidence to a similar effect.

Under the Act of 1894, it was said, the district surveyor and the builder discuss the plans and the surveyor points out any irregularities. If there is a dispute the matter goes to a petty sessional court. But generally there is no dispute, and the building can be commenced as soon as the surveyor consents; there is seldom forty-eight hours' delay. Under the Bill, if officials have to report, and their report has to be considered by the Building Act committee, and perhaps some other committee and the decision has to be confirmed by the Council, there would, it was argued, be more than two months' delay caused.

In the Bill as introduced a right of appeal from the requirements of the Council was given in the case of existing buildings which are high buildings and twenty-person buildings. The promoters also early in the case expressed their readiness to give a right of appeal in the case of existing buildings coming under the provisions as to projecting shops and as to means of escape to the roof. They objected to giving a right of appeal in the case of existing buildings coming under the provisions relating to places where inflammable liquid is stored, but the committee decided to maintain the principle of giving a right of appeal in all cases so far as existing buildings are concerned, and the clause as to premises in which inflammable liquids are stored was amended accordingly.

The petitioners pressed for a right of appeal from the Council's requirements in the case of new buildings also.

The agent for the Rolls Estate thought it unreasonable that builders should be left at the mercy of the Building Act committee. The present committee might be reasonable, but at a future date another committee might make unreasonable requirements.

The main objection of the Chamber of Commerce to the provision as to new high and twenty-person buildings was that it allowed no appeal.

Mr. Lilley said that if a right of appeal was given in all cases there would be no hardship in the Bill.

When the committee came to the consideration of clauses all the opponents strongly pressed this point. The promoters, however, pointed out that no appeal was given in the case of new buildings under the Factory Act, the provisions of the Metropolitan Management Act as to theatres, or, as they claimed, under the Building Act of 1894, in constructional matters. A right of appeal was unnecessary, because in the case of buildings still to be erected the cost of meeting the requirements as to means of escape was small. To give a right of appeal in the case of new buildings would be to introduce a new principle and to fritter away to a large extent the value of the Bill.

The Commons committee supported the promoters.

When the Bill came before the House of Lords committee the opponents offered to allow the consideration of the preamble to be postponed if the promoters would consent to the right of appeal in the case of new buildings. The promoters, however, refused, and the point was again argued at length.

For precedents the promoters quoted the provisions of the Metropolitan Management Act as to theatres, the Factory Act, the provisions of the General Powers Act 1902 as to lodging-houses, and section 63 of the Act of 1894 as to high buildings.

As to the first three precedents, it was argued by the opponents that these Acts only dealt with special kinds of buildings, and did not, like the Bill, apply to buildings generally. The legislation as to theatres was full of special precautions, and was not a precedent for a general Bill. The Factory Act was a public and not a private Act, and consequently when it was being framed private interests were not heard. As to section 63 of the Act of 1894, that only applied to buildings over 60 feet, which were comparatively rare. According to Mr. Riley's evidence that 298 high buildings were 75 per cent. of the total number in London, this section would only affect about 400 buildings. But by reducing the height to 50 feet, as in the Bill, a great number of buildings would be brought in—2,000 of them—according to Mr. Riley's estimate of 1,400 as 75 per cent. of the total number. Further, twenty-person buildings were very numerous.

As to the precedents afforded by other sections of the Act of 1894 than Section 63, there was much dispute. Sections were quoted in which there was an appeal from the Council on such matters as space at the back of a building. Mr. Riley drew a distinction between the planning of sites and the internal planning of a building, and maintained there was no appeal from requirements as to construction. It was argued against this that such a distinction could not have been the principle guiding the Legislature in framing the Act. The principle that guided them was that of the importance of the requirements, and they gave an appeal in cases where owners' interests were seriously affected. Generally speaking, the Act of 1894 did not leave the Council discretionary powers; it specified the requirements. Section 63 was the only important exception.

The promoters argued that in the case of a new building the difficulty of meeting requirements as to means of escape was small, because there were no existing arrangements to consider. The builders started with a new project on paper, and could easily make alterations to meet the Council's demands. In reply it was pointed out that the question of sites was of vital importance. Unless the site could be utilised to the best possible advantage the cost of the building might be enormously increased. High buildings were naturally more frequently erected where land was valuable and twenty-person buildings were most common in the commercial parts of the town, where also land was valuable and sites were cramped, and the development of the sites for these buildings was particularly important. Again, in cases where a building was pulled down to half its actual extent, and then, when re-erected, became a new building, the question of the arrangement which would be most suitable to the site was clearly vital.

In all cases the requirement of an extra staircase might necessitate a totally different arrangement of the building. In letting land difficulties were likely to arise, as it would not be possible to know beforehand the Council's requirements, and until these were known it would not be possible to know how the site could be utilised, whereas a right of appeal would give a greater sense of security. The case

of the Tooley Street pin factory was quoted to illustrate how much tenants were afraid of the Council's requirements.

The opponents also urged that the argument of the Home Office against leaving the requirements as to means of escape to the roof in the discretion of the Council was an argument for limiting their discretion in these other matters by a right of appeal.

With every desire to be reasonable, a public body like the Council could not always take into consideration all the circumstances of a case. To avoid an appearance of impartiality they must be guided by general rules.

Before a tribunal of appeal an owner had a better chance of stating his case. It was only by the grace of the Building Act committee that an applicant could appear before them in person and state his objections to their requirements; he could always appear in person before the tribunal of appeal.

Further, the Building Act committee had not the same technical knowledge and experience as the arbitrators. The attention of the committee was directed only to the need of means of escape, and other important considerations familiar to persons with experience of building did not come before it.

What harm could there be in an appeal? If a man appealed unreasonably he would have to pay costs. The Council's statement as to the few cases in which there had been appeals under the Factory Act showed that the right of appeal was not likely to be abused.

The Council, on the other hand, maintained that no right of appeal in the case of existing buildings had been given by Section 63 of the Act of 1894, and no one had ever claimed there should be such a right. If a right of appeal were given, it would lessen the existing powers of the Council, as the provisions in the Bill were intended to take the place of Section 63.

Many insignificant disputes would arise, and to take them before the tribunal appointed to consider appeals with its ceremonious procedure would be absurd.

Complications would be caused. It would be unreasonable, e.g. for the Council to have to give a certificate for a building of which they might disapprove, but which had been erected in accordance with the requirements of the arbitration tribunal. A decision might be given by the tribunal as to means of escape, and then it might be necessary again to consider the whole construction of the building in view of the requirements of the Act of 1894 as to light and air, &c. (Against this it was argued that the tribunal would be competent to take all these considerations into account.)

Counsel for the promoters also suggested that there was some check on the Council's requirements already provided in the Bill. If they refused a certificate and the owner allowed a building to be occupied in defiance of their refusal, the magistrate before whom the owner was prosecuted would judge of the reasonableness of the Council's requirements. It was pointed out, however, that the magistrate would only be competent to decide if the certificate were wrongfully withheld, and it could not be considered wrongfully withheld if the building were not in accordance with plans approved by the Council.

The Council also maintained that their claim to discretionary power was justified by the approval given by the Home Office and Chief Inspector of Factories of their work under the Factory Act.

The House of Lords committee decided that there must be a right of appeal in the case of new as well as in the case of existing buildings.

MUNICIPAL REQUIREMENTS.*

THE proper housing of the labouring classes, both in urban and rural districts, is a "problem" which has not yet been satisfactorily solved. It involves not only engineering but serious economic questions which are not easy of solution.

The employment of the unemployed on municipal works is a somewhat similar problem. It is not an easy matter to find suitable work for the men who swell the ranks of the unemployed; many of them are unfortunately unfit for such work, and some of them are what the Germans call "work shy."

* From the address by Mr. H. Percy Boulnois, as president of the Conference of Engineers and Surveyors at the Congress of the Royal Sanitary Institute at Bristol on Tuesday.

Another question which "looms large in our perspective" is that of the recent revolution in the description of the locomotion on our roads and streets by the introduction of motor-cars and traction-engines, which have entirely altered the character of the traffic which our roads and streets were designed to carry. Whilst, on the other hand, their surfaces will not be subjected to the hard hammering of the horses' hoofs, they will be subject to a tearing, disintegrating action from the rapidly revolving pneumatic tyres of the motor-car and to greatly increased weight of the traction-engine and its accompanying loads.

Not only is this question one of future construction and maintenance of our roads and streets, but there is also the question of the dust raised by this rapid locomotion, which is becoming a terrible nuisance throughout the country and must be stopped before serious damage thereby is caused to persons and to property.

Whilst on the subject of our streets it may be well to call attention to the question which is now being raised in many quarters as to whether the rigid tramline and "inelastic" traffic of the tramcar is suitable for our crowded streets, and whether the motor omnibus is not a suitable substitute for the conveyance of the increasing traffic.

With regard to the supply and distribution of water, the question of the economical supply of pure water to our villages and scattered houses is worthy of every engineer's attention, as such supplies are required all over the country. Unfortunately the cost is generally prohibitive, or a local source of water-supply is only available by pumping, involving such an outlay and annual cost as is quite beyond the means of the district.

The various types of "wind-engine," which were introduced as a cheap means of pumping water, have not met with the success that was at one time hoped for them, chiefly owing to the uncertainty and unreliability of the velocity of the wind in this country.

There have been some improvements in pumping water since 1892, notably the introduction of the "air lift," whereby it has been made possible to raise more water from deep wells, especially in bores of small diameter, at a reduction in cost.

The manufacture of special jute-covered steel tubes for water-mains has, under certain conditions, tended to lessen the cost of the distribution of water where these tubes can be used instead of the ordinary cast-iron pipes, but hitherto it has been found that they are not suitable for service mains where they have to be tapped with ferrules for house services. For long lengths of sealed mains they can be laid with advantage, especially where there is any risk of ground subsidence.

Concrete construction has made considerable progress since 1892, due to the introduction of the Hennebique patent processes, and there is, no doubt, a large field open for this description of construction in many branches of engineering. The strengths obtained by this "fortified" concrete have been remarkable, and it looks as if our text-books on the strength of this material will have to be revised.

With regard to some of the minor questions with which you are constantly dealing, a discussion has again lately been revived as to whether the house drain should or should not be trapped before it enters the sewer, and there seems to be considerable divergence of opinion on the matter.

Street lighting has made great strides since 1892. The introduction of the Welsbach and other gas mantles has given a great impetus to gas-lighting, and although an improved electric arc lamp has been lately introduced, gas-lighting for the present seems to hold its own in street lighting where properly and scientifically carried out. There are, no doubt, still further developments to be made both with gas and electricity for lighting and heating purposes.

With regard to the disposal of house refuse, there have been some improvements in the construction of "destructors," whereby the gases are more thoroughly consumed, and we hear less of nuisances caused in the neighbourhood of these very necessary installations than was formerly the case.

With regard to public baths an improvement has lately been introduced whereby the water in a swimming bath can be filtered at a very small cost, so that the same water is used over and over again; this greatly reduces the cost of water, and also renders the water in the bath always bright and clear and more attractive on every day of the week, instead of allowing it to get dirty and discoloured before it is changed, which is the general practice.

I have endeavoured in this short address to draw attention to some of the questions in which you are all interested, and in which you all have to take a part in forming the real history of a country.

"Progress" is the watchword of every engineer, and it is especially so with the municipal engineer, as the eyes of the public are so constantly upon him, and he is subject to much criticism.

There is no finality in engineering, and it behoves us, who have the well-being of the country at heart, to take advantage of everything that will help us to meet the difficulties which must ensue from the modern desire of the human race to aggregate together in large centres of population. I trust that this conference may assist in the discussion and, perhaps, elucidation of some of the engineering problems that are now so prominently before the public.

CONCERNING MASONS AND MASONRY.

ACCORDING to Stow, "the Company of Masons, being otherwise termed Freemasons, of ancient standing and good reckoning, by means of affable and kind meetings divers times, and as a loving brotherhood should use to do, did frequent this mutual assembly in the time of King Henry IV., in the twelfth year of his most gracious reign. Their arms granted by William Hanckeston, Clarenceux King at Arms, 13 Edward IV." He also adds:—

"The Saxons were ignorant of building with stone until the year 680, for then it is affirmed that Benet, abbot of Wirrall, Master to the Reverend Bede, first brought artificers of stone houses and glass windows into this island amongst the Saxons, arts before that time unto them unknown, and therefore used they but wooden buildings. And to this accordeth Blicronicon, who says, 'that then had ye wooden churches, nay wooden chalices and golden priests, but since golden chalices and wooden priests.' And to knit up this argument King Edgar in his charter to the Abbey of Malmesbury, dated the year of Christ 974, hath words to this effect:—'All the monasteries in my realm, to the outward sight, are nothing but worm-eaten and rotten timbers and boards, and that worse is, within they are almost empty and void of divine service.'"

Mortar.

The word mortar comes from the Latin *mortarium*, a vessel in which things are pounded or brayed together like a salad. Hence applied to the lime, cement, &c., used for building purposes, which are blended together as if in a mortar.

Among the numerous conjectures how the excellent mortar of the ancient buildings was made there has been hesitation to suggest that articles so expensive as beer and eggs entered largely into the composition; yet, from the following items in an account for repairing the spire of Newark Church, the constituents included such additions:—

The whole charges for pointing the steeple to the battlements, donne and begonne in Easter weke and ended the weke before Cross weke, in the yere of Our Lord a thousand five hundred seventy-one and in the thirteenth yere of the reign of Our Sovereign Ladye Quene Elizabeth, and in the time of Mr. John Brignell, their alderman:—

Item, one grette rope for the cradell pulley	£0 15 0
Item, six strike of malte to make worthe to blend with the lyme, and temper the same	0 7 2
Item, seven quarter lyme	0 4 0
Item, three hundred and a halfe eiggs, to temper same lyme with	0 4 8
Item, a load of sand and smithe come	0 1 6
Item, a rope to draw up the cradell with	0 1 6
Item, for a rope making	0 3 4
Item, paid to the mason for workmanship of the same steeple	4 0 6
Item, gave him in rewarde bezydes his usages	0 11 8
Item, for bruynge the malte	0 1 2
Item, paid to his laborer for twenty-seven daies	0 13 6
Item, for southeringe the wether coke	0 3 4

Summa totalis £7 7 9

Other observations arise out of this account. In the first place, it is evident that no scaffolding was used, but only a cradle and ropes; secondly, what is meant by "Cross week"? which seems to have occurred about five-and-thirty days after Easter week, as the labourer was paid for twenty-seven days' work, which began in Easter week and finished the week before Cross week.

The churchwardens of St. Martin's, Leicester, having

determined in 1606 to point the steeple, purchased the following with which to make the mortar and cement:—

Item, payd for one loade of lyme	vj	d
Item, payd to John Harris for one loade of sande	xvj	
Item, for egges	iiij	vij
Item, for iiij th of allome	—	x
Item, for j strike of peeces	—	ix
Item, payd for iiij th of rosen	—	vij
Item, for woode to seeth the peeces	—	iiij
Item, payd for more egges	iiij	—
Item, payd for three strikes of mault	vj	—
Item, for three strikes of Smythie come	—	iiij

From a similar set of entries made in 1609 we learn the "peeces" mentioned above were "glovers' peeces," and from another set under the date of 1630 we obtain the fuller description:—

Paid for calves leather peeces to make the size with	ij	d
	x	

As just seen, our forefathers believed that beer, eggs and various other such like things if put into mortar made it stronger. In the church accounts of South Lincolnshire there is an entry under the year 1616 for "ix quarts of ale to make Craven's mortar strong xviii^d." Craven was the master mason. He and two of his men were employed at this time in repairing the steeple and the "chancell end." In the same account under the year 1714 there occurs the following:—"For two quarts of ale and two pound and a half of cheese to make Simonds mortar ix. 1^d."

There was formerly a notion that mortar was at times mixed with blood. In J. M. Ludlow's "Epics of the Middle Ages," vol. ii. p. 283, we read:—"The besieged take refuge in a tower, stabling their horses underground. The tower is Saracen work; all the mortar was boiled with blood, it fears no engine." Clement Walker, in his "History of Independence," writes:—"When usurped ttranny layes its foundations in bloud, the whole super-struction must be built with mortar tempered with bloud."

In the Hon. Frederick Walpole's "The Ansayrii," 1851, this passage occurs:—"Merkab is two miles inland. There are several remains of buildings about, which probably once joined the mina to the castle. In a field near by may be seen a huge reservoir of water. There is likewise a story that the mortar was mixed with oil instead of water, and that the huge tank to be seen near the walls was full of it. They allude to an inscription which says, 'We 15,000 men, well paid, well treated, worked at this. Every stone was cut and brought, every stone was set with oil, oil one parra the bottle.'"

Sir John Forbes, in "Sight-seeing in Germany and Tyrol," 1856, when describing the Stephans-kerche at Vienna, says:—"The completed tower was founded with the rest of the church in 1359, and after being advanced under several architects was finally completed by Hans Buchsbaum in the year 1433. The second tower was founded by the same architect in 1450 (the mortar on the occasion, according to tradition, being mixed with wine), but was never carried beyond its present height."

Yorkshire was noted for lime. Fuller in his "Worthies of England" says:—"I am credibly informed that, within a few miles of Pontfract, no less than 20,000^l. worth of this coarse commodity is yearly made and vended in the vicinage. It is a great fertiliser of ground if judiciously disposed. Indeed, the laying of lime on light and sandy ground (like the giving hot cordials to persons in high Feavours, enough to drive them into a Frenzy) will soon burn out the heart thereof, which bestowed on cold and chill ground brings it to a fruitful consistency, and, prudently ordered, it will for a long time retain the same."

Cement.

The following recipe is copied from a "Register of Occurrences" kept by the Prior and Convent of Durham, and now in the possession of the Dean and Chapter. The next entry is dated July 2, 1413:—"Take new brynte lyme and water, and the skarthes of newe tyle, and stampe yam to the mykilnes of beenes, or sum what gretter, and synders yat comes of ye smythes herth, and breke yam on ye same maner lyke ye tyles, and blend yam to gider with water, and take thre partes of lyme, and yen lay two tyle thicke in lyme and morter, and yen take all yat es befor sayd and lay itt all above two ynche thicke, and yf itt be thikker itt es ye better; and take and syfte all ye small poudre oute of

* It is stated later that "Smythie come" are the scales cast forth from hot iron by the smith's hammer. These scales in Yorkshire are called smythycome or smythycum. Wine is sometimes mixed with mortar in Spain at this present day.

ye lyme, and ye tyele, and ye syndres; and ever as ytt es fressh wrought cast ye same poudre above ye werke. And yis must be done in Marche, for ye frost will elles lest it."

The following description of a method of making mortar, which will be impenetrable to moisture, is to be found in the "Memoirs of Agriculture, 1771":—"Take of unslacked lime and of fine sand in the proportion of one part of the lime to three parts of the sand, as much as a labourer can well manage at once; and then, adding water gradually, mix the whole well together till it be reduced to the consistency of mortar. Apply it immediately while it is yet hot, to the purpose either of mortar, as a cement to brick or stone, or of plaster for the surface of any building.

It will then ferment for some days in drier places, and afterwards gradually concrete, or set and become hard. But in a moist place it will continue soft for three weeks or more; though it will at length attain a firm consistence even if water have such access to it as to keep the surface wet the whole time. After this it will acquire a stone-like hardness and resist all moisture.

This method of making mortar was discovered by a gentleman of Neufchâtel, the back part of whose house being cut out of a rocky hill; the spring from the rock produced a continual damp which nothing could cure till he tried the mortar above described, which effectually answered his purpose, and which by time grew so tenacious and firm that he was induced to believe the method of composition was the same with that pursued by the ancients.

This mortar is extremely beneficial for preventing the oozing of water through the floors or walls of houses where the common method would have no effect.

When a very great hardness and firmness are required in this mortar the using of skimmed milk instead of water, either wholly or in part, will produce the desired effect; and in this circumstance likewise the preparation is imagined to resemble that of the ancients.

Bacon says:—"There is a cement compounded of flour, white of eggs and stones powdered that becometh as hard as marble."

Pozzolana Mortar and Pine Timber.

Prior to 1870 in Rome the beams used in the construction of houses were of chestnut wood; after that date pine was largely used. After a few years the roofs and floors in which the pine had been used were found to be failing. A beam used in flat roof or in flooring where it was embedded in the wall was found to be rotten, while the body of the beam was perfectly sound. The cause was a puzzle for a long time, but on taking down the scaffolding of the Ministry of Finance a complete answer was found. One of its scaffold poles had been embedded in the ground; about its foot was a heap of the debris of Pozzolana mortar. That part which had been underground was perfectly sound, that which had been surrounded by the mortar was utterly rotten, and, finally, the remainder of the pole above the ground was perfectly sound. Hence it was clear that the mortar was to blame.

Pozzolana is a volcanic earth, and as this substance had been used for mortar in Rome and Naples for ages in contact with chestnut beams with impunity, the only logical conclusion is that pozzolana and pine wood have some chemical affinity which causes some of their ingredients to combine to the destruction of the latter.

Wolfius observes that the sand should be dry and sharp, so as to prick the hands when rubbed, yet not earthy, so as to foul the water it is washed in. He also finds fault with masons and bricklayers as committing a great error in letting their lime slacken and cool before they make up their mortar, and also in letting their mortar cool and die before they use it.

Stone.

Building stones are obtained more or less from every geological formation known. Granite was used by the Egyptians, alabaster by the Assyrians, marble by the Greeks, and sandstones and limestones by the Romans and Mediæval and modern nations. Each nation has been more or less dependent on the native rock of the district for building stone, and with material so ponderable this must ever remain one of the conditions of using stone largely for building purposes. Where granite is found and has been used, or is used largely, the buildings will have a rude and massive grandeur; where marble abounds we may have elegance and refined beauty as in Greece; where the more common sandstones and limestones form the superficial crust of a country, buildings should be modified in form and detail to suit such materials. The great cost of working granite into the most

simple forms will ever prevent its use on a large scale by any nation for domestic as also even for national masonry. It has been said that the stone produced in any district harmonises best with such district; buildings erected of native stone are more in keeping with the surrounding landscape. Every building stone is composed of grains and crystals, cemented and bound together by a natural process of chemistry. The hardest and most enduring rocks are compounds which nature has formed, and which nature's elements can disintegrate again to mouldering waste. Stones, like timber, to be used in building should be well seasoned by exposure to weather.

ANCIENT SANITATION.*

IT has been often observed that arts and sciences, no less than cities and people, have their periods of advance and of retrocession, of rise and of decline, and to this observation sanitary science, I conceive, offers no exception. The ordinances of Menu, one of the most venerable of legal institutes, mention offences in diet as one of the things through which "the genius of death becomes eager to destroy men" (translation by Sir W. Jones, p. 123), and the Levitical laws of the Jews contain, as is familiarly known, many enactments of a sanitary character, especially in relation to leprosy: and so remote seems to have been the origin of these provisions, alike in Hindustan and Judea, that they appear already to us in the form of Divine commands. Amongst the Greeks I know of no earlier traces of a consideration for healthful practices than are to be found in some passages of Hesiod, where he enumerates for us some of the rules of rural life in Bœotia some 700 or 800 years before Christ. The warning not to enter the house when affected by certain kinds of pollution, the prohibition of the doing of certain acts with unwashed hands and of the fouling of streams and fountains, are all supposed to have the sanction, more or less direct, of the gods, or all may probably have had their origin in a care for the general health.

But it is to the Romans, and not to the Greeks, that we look for the first practical works of a sanitary kind, and their earliest structures are such as still to challenge our admiration and our wonder. According to the Roman historians, to whom in this matter we may, I believe, give full credence, Tarquinius Priscus began and Tarquinius Superbus completed the great works for the drainage of Rome, of which the Cloaca maxima was the most remarkable feature. These works excited the warm admiration of the encyclopædian Pliny, and their construction appeared to Livy and the other Roman historians as one of the most remarkable of the works of the regal period at Rome, and the remains of the Cloaca maxima still pouring its effluent into the Tiber justly excite the admiration of the modern antiquary. Probably no drainage operation ever had so mighty an influence on the history of the world, for the result of these works was not merely to carry away polluting matter, but to convert the low swampy land lying in the midst of the hills of Rome into the solid ground on which the Forum Romanum was constructed, and thus to afford a common meeting-place for the inhabitants of the several communities of the several hills of Rome, that is, to form the very home and nursery of the fierce Roman people, from whence they went forth conquering and to conquer.

Even more remarkable than the case of the Romans in the drainage of their city were their labours for the supply of the city with pure and abundant water. From the time of the great Censor, Appius Claudius, the builder of the Appian Road as well as the great Appian aqueduct (312 B.C.) to the time of the Emperor Alexander Severus (cir. A.D. 221), Rome went on adding aqueduct to aqueduct, some of which still supply the city with water, until no less than eleven streams yielded their daily supply to the people of the Imperial city.

Another way in which the Romans showed their appreciation of practical sanitation was the use they made of warm and medicinal natural springs. Almost every such spring within the wide circuit of their Empire still bears traces of their munificent baths. Our neighbouring city of Bath, the Aquæ Solis of the Romans, is a good illustration of the care and splendour with which they adorned the hot springs, to the use of which they were so much addicted.

* From the inaugural address of Sir Edward Fry, P.C., delivered at the opening of the Congress of the Royal Sanitary Institute at Bristol on Monday.

A few months ago I visited in North Africa the remains of the town of Thamugas (now Timgad), built by Trajan for the veterans of the third legion, and I was much struck by the evidence which they afford of the care of these matters exhibited in the construction of the town. These ruins now stand in solitary grandeur amidst the desolate Aurès mountains, almost on the northern boundary of the Sahara desert, and rival if they do not excel Pompeii in the impression they make upon the mind of the beholder, and not the least surprising thing in this magnificent city is the system of drains which were constructed down all its principal thoroughfares—drains that recall if they do not equal the dimensions of the Cloaca maxima of Rome. The city, moreover, was abundantly furnished with magnificent baths and cisterns of water, and in the house, I might almost say the palace of Faustus, a man of great distinction in this remote city, one still sees the bath-room, and on each side, as you approach it, two pillars or pedestals, one inscribed with the name of the god Æsculapius and the other with that of the goddess Hygieia—so consciously did the Romans in this remote spot recognise the duty of seeking after health.

It is needless to observe that the Romans were without any of those scientific appliances on which we so largely depend, and were without that exact knowledge of the enemies to health upon which we rely. Nevertheless, we find, as I have shown, that they were great sanitary engineers and constructed works of water-supply and drainage not only in their capital, but throughout their Empire, upon which we cannot even now look without something almost of envy. If Rome in her ignorance could do all this for herself and for her remote provinces, what ought this country to do for herself and all the branches of her empire?

Upon all this splendid civilisation of Rome came down the barbarous North. The internal forces of the Empire were unequal to resist the impacts of Goth, Vandal and Lombard, and the fabric of the Western Empire went to wreck and ruin, and with it disappeared all thought of sanitary science—to remain, so far as I know, dead during the dark ages and to revive only in the course of the last century, and then in a new form and with means of investigation and of the ascertainment of exact knowledge of which the wisest Roman never dreamed. Under such favourable conditions it is your good fortune to pursue your studies for the alleviation of some of the ills that beset poor humanity.

THE LATE STANFORD WHITE.

THE fact that the daily papers of the best type gave an unusual amount of space to the details of the murder of Stanford White on the roof-garden of Madison Square Garden, New York, may be taken, says the American *Architect*, as an indication of his standing in the community and the interest felt by many in his unusual personality. Unusual he was—an anachronism, in fact. He belonged not to to-day, but to the time of the High Renaissance—if not to the remoter times of Sybaris and Syracuse—when men seemed to live merely that they might pursue, enjoy and create beauty. There are men a plenty who can pursue and enjoy beauty, but not so many who can create it, and the murdered architect was a creative artist to the extremist limit, a man whose talent verged on genius, and as genius has been cleverly defined as a form of insanity, it is not, perhaps, to be wondered at that he was at times erratic in conduct and performance. But if he felt like indulging in an eccentric piece of brickwalling, as in the new woman's club on Madison Avenue, he re-established himself as a sane and conscientious as well as progressive artist by giving the most anxious attention to the details of the new church for Dr. Parkhurst, a few blocks away. It was rarely, though, that he allowed himself to indulge in meaningless eccentricity; there was everywhere apparent a striving after a desirable effect, an effect of texture and colour, rather than one of mere form. The consequence is that his work was always warm and human, never chillingly correct and conventional.

Born in 1853, the son of Richard Grant White, the well-known essayist, Stanford White began his architectural career in the office of Gambrell & Richardson. Then, after a few years spent in travel in Europe, he returned to New York, and at the age of twenty-eight succeeded Mr. W. B. Bigelow as the third partner in the now well-known firm of McKim, Mead & White. Owing to the peculiarly individualistic methods which this firm has adopted, each claim-

ing and being accorded the right to handle the jobs that come in through and because of his personal efforts or qualities, it is peculiarly easy to determine the authorship of the work that is turned out in the firm name, and it is generally known that Mr. White was responsible for, amongst other notable buildings, the Tiffany and Fish houses, Madison Square Garden, the Washington Arch, the Judson Memorial Church and a very large number of costly and picturesque country houses. Perhaps he was seen at his best in monumental work, properly speaking, as in the Adams Monument in Rock Creek Cemetery, Washington, and the pedestal for the Farragut Monument in New York, and many others in different parts of this country. He was a rapid, tireless and inventive worker. His death will be a serious loss to his partners, the profession and the public.

RATIONAL EXTENSION OF CITIES.*

THE modern city in this country has been built up piecemeal and in patches, generally without any regard for the artistic, with no attempt on a large scale to lay out building blocks for residences, separate areas for manufacturing, wide central spaces for schools, institutes, theatres, churches, &c. Everything in relation to these matters has been allowed to grow according to the idiosyncrasy of the individual, without any regard for the communal good. The result is large slum areas; dwelling-houses side by side with industrial works; *bona-fide* working men, in order to be near their employment, gradually accommodating themselves to the tenement system, all of which heavily handicap him in the race for bread and lower his moral vitality. In addition to the above drawbacks, in consequence of our system of rating and taxation, municipal debts are accumulating at such a rate that they become increasingly heavy. The pace we are travelling in the direction is somewhat alarming.

Without taking into account our increased financial responsibility due to the late South African War, our municipal debts are increasing in such degree that, though we are wiping off the National Debt over 10,000,000*l.* per year, our total indebtedness (national and municipal) increases because of expansion in local expenditure.

In passing, I would like to add the whole of this financial load has to be carried by the workers (brain and hand), whilst the financial profit finds its way into the pockets of the landlords, who do not as such contribute a penny through the rates.

The whole of these social difficulties and moral evils have been, and are, aggravated by that modern phenomenon, the migration of the village population to the towns and cities. Seventy years ago 70 per cent. of our people lived in the rural districts, 30 per cent. in the towns. To-day that has been reversed, and we see 70 per cent. of our people living in the towns, and only 30 per cent. in the rural districts.

The unemployed question is so closely linked with the one we are discussing that I think it pertinent, and it may be profitable to notice the statement made by the President of the Local Government Board in the House of Commons on the occasion of the unemployed debate:—

"Ninety per cent. of the unemployable in the cities are town-born men who have been pushed out of their employment by the village-bred men. These have drifted into the city, driven out of the village by, among other things, the dull, drab life, low pay, lack of vital interest in the soil, and attracted to the city by apparently higher wages, brighter life and the greater freedom which city life affords."

The efforts of reformers in the future, as taught by the above fact, must be of a twofold nature:—(a) To prevent the influx of village labourers into the cities, thus giving partial relief to the congestion, and (b) to secure big belts of land outside cities, but within reasonable distance of industrial works, for building purposes.

One of the principal aims of the intelligent reformer is the prevention of the growth of slums in the future. Every thoughtful and intelligent man who has devoted any serious attention to the housing problem of our great cities must have realised that much of our cottage property put up in recent years, or now being built, will show very little superiority over the dwellings it displaces when it has been in existence as long as the latter. Faulty design, faulty material,

* From a paper by Arthur Richardson, M.P., read at the Conference of Municipal Representatives at the Congress of the Royal Sanitary Institute on Tuesday.

faulty construction and want of surrounding space all combine to render the houses but little better than their predecessors, so far, at any rate, as the prospect of future fitness is concerned. Many of our municipalities and private owners know what ought to be done, and would be prepared to do it, but for legal and departmental difficulties of an insuperable character standing in the way. Local authorities can now buy land either within or without their districts for the construction thereon of workmen's dwellings, but the houses must be built at once, and the purchase money, if obtained from Public Works Loan Commissioners, repaid within thirty years. What we require is the power to buy large tracts of prospective suburb before it has acquired the price of building land, such suburban area to be laid out on plan after careful and expert consideration, but only to be built upon when the need for new building arises, and then only in accordance with the prearranged plan. The roads should be wide, straight and planted with trees, and should be arranged to intersect as far as possible at right angles. The area should be segmented, and certain definite sections set apart for certain definite and separate purposes, *e.g.* one section should be for good-class residences, another for workmen's dwellings, another for factories of various kinds and suitable railway sidings and depôts connected with them. Special attention should be paid to the question of provision of open spaces, municipal lungs, and specific sections of these parks and recreation grounds set apart and equipped for very young children. Baths (swimming and washing) should not be forgotten in connection with these. The minimum area allowed for these breathing spaces ought not to be less than one acre in ten. There should be no such thing as the intrusion of slaughtering establishments or other offensive trades into residential neighbourhoods. If we, in this country, were in a position to arrange for the future extension of our cities in this way, we should be able to deal with the so-called housing problem of the times in a far more satisfactory manner than at present.

Briefly, the obstacles lying across our path are:—The shortness of the term on which the loan is granted, thirty years; compulsion to build immediately; and the criminal indifference and sometimes active opposition on the part of the general public, brought about by the inherent difficulties of the problem, the details of which few understand. The financial risk consequent upon inaccurate estimates as to cost of demolition and removal of condemned property generates in the minds of ratepayers dissatisfaction, often resulting in opposition discouraging to the real reformer.

In 1880 a block of buildings in Parliament Street, Nottingham, was condemned by the authorities. It comprised 104 artisans' dwellings, with a population of 473 persons, 73 of these not being of the artisan class. It was estimated that the scheme would cost 90,000*l.*, but the actual amount ultimately paid was 191,000*l.*, or more than double the original estimate. This area had been condemned for many years as a fever den and moral pest, but financial difficulties prevented the improvement becoming an accomplished fact. On the heels of the money difficulty came the vexed question of rehousing. A municipality is hardly justified in pulling down 104 homes without making adequate provision for rehousing. This might have been done but for the red tape of the Local Government Board. Houses were erected in the Westminster Street district to accommodate the 400 unfortunate people turned out of Parliament Street, but here is the real difficulty. The rents in Parliament Street ranged from 2*s.* to 4*s.* per week; the houses built according to Local Government Board regulations could not be let under 5*s.* to 7*s.* per week, so that the whole of these poor people crowded into districts already congested.

Another example of the same difficulty arose through the Great Central Railway cutting through a poor district in Nottingham. One thousand three hundred working-class dwellings were demolished for this purpose. These were replaced in the Windsor Street district by houses which could not be let under 6*s.* per week, and in some cases 10*s.* And yet another—perhaps the worst of the three local cases. Three hundred and forty-two houses were pulled down in the neighbourhood of the old prison (St. Ann's Well Road scheme). Their weekly rentals were 2*s.* 6*d.* to 4*s.* 6*d.* The houses built in Coppice Road to take the place of these numbered only 120, but the lowest let at 6*s.* 6*d.*, and some as high as 7*s.* 6*d.* How are these social wrecks to make ends meet when, through no fault of theirs, their rent is trebled?

But what has been the effect of these public building operations on contiguous land? It has been to enhance the

value over 100 per cent. Land which previously barely sold for 200*l.* an acre is now readily sold at 500*l.*

These facts point one moral. The time has arrived when, in the interests especially of the poor, but also in the interests of the community, the municipality should secure wide strips of land outside the city borders.

What all reformers desire is power to build suitable dwellings for the poorest class. Seeing that the Board of Works Loan Commissioners have full security for money borrowed on land, the thirty years' term ought to be extended to sixty at least; one hundred would be better still. Municipalities would be greatly assisted if, when they borrowed money for building purposes of this description, they were not compelled to build immediately, but only as there arose an effective demand.

The housing problem cannot wait, but calls for immediate attention and solution. In Nottingham we have, according to the last census, 350 one-roomed tenements, with families inhabiting them numbering in some cases seven persons; and 1,760 two-roomed tenements, with families inhabiting them numbering in a few cases nine persons. How can we expect human beings to be physically fit and morally healthy under such indecent and foul conditions? It is impossible.

This blot on our municipal escutcheon can only be removed by personal effort, collective action and legislative enactment.

PROGRESS OF SANITATION.

THE summer meeting of the Institution of Sanitary Engineers has been held in the Municipal School of Technology, Manchester. Sir William Mather, C.E., who presided, said the Institute represented the most beneficial of all the branches of the engineering profession. The sanitary engineer laboured in a field in which, more or less, all branches were interested, but which had to do almost solely and alone with the well-being of the people in the highest sense of the word. To be occupied in projecting and carrying out schemes for the purpose of improving the health, the comfort and the means of life in large communities was a noble work. The sanitary engineer had to work without many of those incentives and rewards which attached to other branches of the profession. He was occupied in dealing with elements in life which were not generally regarded as delightful to look upon or to contemplate; it was a branch of engineering which did not offer many attractions to those who desired to win praise from their fellow-men or to erect monuments to themselves by the work of their hands. England, as they knew, enjoyed the reputation—or did enjoy the reputation some years ago—of being the most advanced nation in the world in sanitary science and in its application. He remembered some twenty years ago an eminent German scientist, Dr. Virchow, who came to England to consider institutions, educational, municipal and otherwise, reported on his return that England was one hundred years behind Germany in education, but one hundred years ahead of Germany in sanitation. He thought that figure of speech represented very much the difference then between Germany and England. He remembered Berlin when it was a city ugly and offensive in many respects, with no drainage system except that which was exposed to the street, with a vile atmosphere, bad water and bad lighting. But after twenty years Berlin was now the pride of the German Empire. That great transformation had been brought about because education had advanced and performed its perfect work in relation to applied science to the advantage of the inhabitants of a great city. The sanitary engineer, the civil and mechanical engineer, and the chemist could provide several essential conditions of life without which our boasted civilisation was all veneer and vanity. Every river and stream in the land might be pure, every town and city clear of smoke and noxious vapours, mills and manufactories, wholesome and healthy, and the housing of the people, even the most humble, sanitary and cheerful, with fresh air and open spaces adorned with grass and shrubs, common to all who inhabit the towns, together with good water and efficient drainage. All those science and experience—already possessed by those great professions—could accomplish. The architect, added to these men of science, would contribute the artistic feature to all necessary structures. One proviso, however, must be made, which could not be fulfilled immediately, and without which the advantages of such changes would not be reaped—he meant that education of the right sort must be given to the children

of the humblest classes, and to those above them in the social scale. That, also, was possible. We had already compulsory attendance at schools, and schools were universal. Only one thing was lacking, the right methods and right subjects of instruction for children, to form their minds, to quicken their moral sense, to create right mental and bodily habits. He would rather see the children of our working classes acquiring perseverance, a moral conscience, good manners, clean habits, clean minds, manual training, the habit of thinking, elementary knowledge of the simple laws of health and nature and physical strength, than the whole curriculum of the best elementary school we had. He was convinced that with children possessing the qualities of education he had enumerated all things necessary would be added by self-education. That was the education which would leave the child to grow strong and true, to use his natural gifts in the best way during youth and manhood and womanhood. Then would the homes, once made sanitary, wholesome, cheerful and pretty, become the delight and pride of the inmates. So must education and sanitation co-operate if our civilisation was to be something deeper than veneer and more thorough than vanity.

Human communities were structures depending on their foundations, like other physical structures, being well laid and strong. It was a frequent complaint on the part of our municipalities, when they were charged with neglect of the housing problem, that the expenditure of public money in this direction was not encouraged because such a vast number of people did not appreciate better conditions of life, and the greatest impediment in this country to the better housing of the people was not the want of will on the part of the municipalities nor the want of money—it was the difficulty of maintaining the habitations of the poorer classes in a fit condition for human comfort owing to the habits and want of cleanliness of the people themselves. The first consideration in the advancement of civilisation was to raise the lowest and humblest classes, the broad foundation upon which human society was based, otherwise the superstructure would always be faulty. No efforts to provide what science and natural laws enjoined on us, what ideals inspired, or refined taste and the love of beauty would promote, could avail if the masses of the people did not co-operate by their appreciation, their care and their proper pride to use and rightly enjoy cleanliness, health and the appliances that provide them.

ROYAL ACADEMY ARCHITECTURAL SCHOOL.

THE Architectural School of the Royal Academy will from October 1 next be open five evenings in the week (Monday, Tuesday, Wednesday, Thursday, Friday) from 6 P.M. to 8 P.M., instead of, as now, three.

Applicants for admission to the school who can produce a certificate of fair proficiency from an institution for architectural education recognised by the Royal Academy will be exempt from the necessity of showing the work required for the admission of probationers.

These institutions are:—The Royal College of Art; the Architectural Association; King's College, London; University College, London; Liverpool University; Manchester University. The list may be added to at the discretion of the President and Council.

The first date for the admission of probationers under this new system will be Tuesday, July 31 next; and the certificates, together with the printed form to be previously obtained from the Royal Academy and duly filled in, and the certificate of birth, must be delivered at the Royal Academy on Saturday, July 28 next.

The examination for admission as students of the successful applicants will be held in October next. Any further information can be obtained on application at the Royal Academy.

A Report of the College of Engineers in Venice states that the new campanile, if carried out as proposed, will not respond to sentiment, history or art. The Municipality have therefore appointed a committee to consider the subject.

The Matrix of the monastic seal of the Priory of St. Bartholomew used during the occupation by the Dominicans in Queen Mary's reign has recently been acquired and presented to the church of St. Bartholomew-the-Great, Smithfield. It is of copper and is Renaissance in character. It was in use from 1555 to 1559. The relic is shown to those who visit the newly-opened cloister, where impressions in red wax are sold for the benefit of the restoration fund.

Goodyear and his Critics.

SIR,—We owe a debt to Mr. Goodyear for the careful study he has made of certain "irregularities" to be found in Mediæval architecture in Europe. Whatever was the cause, the facts remain.

There has been a disposition on the part of some of his critics to dispose of the whole matter in a few sweeping words, or to concentrate too much attention on the cause and to overlook the result of these "irregularities."

As to the cause, there are three main influences that have been at work:—(1) Structural defects; (2) carelessness or indifference; (3) deliberate intention.

It may be an interesting study to consider how far any one of these three causes may have influenced any particular case (Amiens Cathedral for example). But beyond this question of design or accident, is it not much more important to consider what has been the result? What is the value in an artistic sense of effect produced by these irregularities? and to what extent may they be carried in modern building without degenerating into crudity?

We have been taught to look on the "refinements" of the Greeks as the perfection of art. Hand-work generally possesses charms that the machine-made article is supposed to be destitute of. A discussion on this point would be of more than academic interest and of value to the progress of architecture as an art.—Believe me to be yours truly,

Cork: July 11, 1906.

ARTHUR HILL.

GENERAL.

The Holborn Borough Council have selected the design of Messrs. Septimus Walker & Herbert Hall, of Gray's Inn, for the new offices. The cost is estimated at 19,205*l*.

Messrs. Clark & Moscrop, architects, Feethams, Darlington, have been awarded first place in a competition for designs for schools to accommodate 950 children at South Moor, co. Durham, for the Durham County Council. The same firm were also placed second. The third place was given to Messrs. Brown & Liddle, of Newcastle-on-Tyne.

The Bucklow Rural Council have decided to take proceedings against Mr. Hazzopulo, the Greek Consul for Manchester, for infringing their by-laws by erecting a building without submitting plans to the Council.

Messrs. Dixon & Potter, of Manchester, have been successful in the competition for the baths, fire station and library at Reddish; Mr. J. M. Smith, Chelsea, second; and Messrs. Shewbrooks & Hodges, Newcastle, third.

The Travelling Scholarships of the Architectural Section of the Liverpool University have been awarded to Messrs. M. Lyon and L. K. Adams.

The Report of the Building Act committee relating to the rebuilding of Regent Street was brought up for approval at the meeting of the London County Council on Tuesday. It was agreed to postpone the consideration for a week. Mr. J. Lewis expressed the hope that the Council would not hurriedly allow the one-storey shops in so important a thoroughfare to be covered with huge buildings.

The Members of the London and Middlesex Archaeological Society, by permission of the King, visited St. James's Palace. Rev. Dr. Edgar Sheppard conducted them over the State apartments and the Chapel Royal, and exhibited the Chapel Royal plate. The sub-dean also read a paper upon the Palace and its historical associations.

Mr. Maurice Greiffenhagen has been appointed professor in the life classes of the Glasgow School of Art. M. Jean Delville, who held the office during six years, is now professor in the Brussels Academy.

The Awards in the recent examinations qualifying for admission to the Glasgow Institute of Measurers have now been issued. In the preliminary examination the following candidates passed or were granted exemption, having presented the necessary certificates:—R. B. Dow, R. B. Stark, Howard Reid and Thomas Scott. In the final examination five candidates passed, and were placed on the register of associates, viz.:—James Brown, Wm. B. Dow, Alexander M. Walker, Frederick Smith and James M. Stewart.

Professor Darroch and Dr. Glasco have been elected by the Governors of the Heriot-Watt College as their representatives on the committee which has under consideration the proposed art school for Edinburgh.

THE WEEK.

It must not be supposed that the decision in the COLLIS case, although expressive of greater latitude in light and air cases is to be taken as warranting that everyone can raise his premises as high as he considers desirable for his own business, without any regard for his neighbour. The decision of Mr. Justice SWINFEN-EADY in the case between the Rector and Churchwardens of St. George's, Hanover Square, and Messrs. FRANCIS & ADAMS, suggests there is still a limit to what is allowable. The defendants admitted that the light would be affected, but only to a trifling amount, which would not cause inconvenience to the congregation. It was easy to imagine that the COLLIS case would cover the diminution of the light, for it cannot be said that the interest of the worshippers corresponds with that of an owner or occupier of business premises in the City. Able witnesses were heard on both sides, including several architects, and the Judge certainly took the closest interest in the evidence. He supplemented it by visiting St. George's on two occasions, and he came to the conclusion that not only was the light diminished, but that there was a material and substantial darkening. His Lordship considered that besides the worshippers those that ministered in the church would be prejudiced if the additional storey was erected, and he granted the injunction with costs. St. George's, Hanover Square, is too important a church to be deprived of the smallest portion of daylight. It is to be hoped that the judgment will be taken as admonitory by all who contemplate building in positions where there are neighbouring premises.

THE decision of the London County Council on the subject of non-provided schools is likely to have some effect on the operation of the latest Education Bill, should it ever become law. Last year the Council called the urgent attention of the managers to certain sanitary requirements. It is now proposed to apply after the summer holidays the smoke and chemical tests to the offices and drains of their schools, and if after the application of these tests it is found that the condition of the offices and drains constitutes an immediate danger to the children, the Council will cease to maintain the schools after October 19, 1906. It will be necessary to temporarily employ extra assistance to carry out the resolution. It may not be generally known how numerous are the assistants at present employed. A return has been prepared showing the number of the unestablished staff employed at the end of June 1906 in the architect's department. They number 229. That number is exclusive of clerks of works, and is divided as follows:—Building Act and factories, 23; means of escape section, 62; improvements, 10; establishment and fire brigade, 25; housing, 44; general, 18; highways, 27; measuring surveyor's, 20. The total weekly pay amounts to 485*l.* 19*s.* The architect's department contains more temporary assistants than any other, for there are only 54 in the engineer's department and 37 in the solicitor's.

SOME of the reports about the condition of the Vatican may be exaggerated, but there is no doubt that important works of reparation have had to be undertaken. The Vatican, it should be remembered, is a collection of buildings, and it would be difficult to ascertain its age. Some archaeologists believe there was a mansion on the site in the fifth century, and CHARLEMAGNE resided in the Vatican at the time of his coronation. Important works were carried out during the Renaissance period, and the names of the foremost architects, from BRAMANTE to BERNINI, are connected with different parts. As the Vatican had always to shelter a large population reparations were not always carried out promptly, and the neglect has produced the usual consequences. At first it was supposed that the necessary works could be carried

out for less than 5,000*l.*, but it is now believed the cost will exceed four times that amount. If all that is proposed should be accomplished the bill must be enormous. Pope PIUS X., being restricted to the palace, has been able to realise the defects which strike many strangers. The variety of people to be met with on the stairs and in the courts is remarkable, but the numerous servants and their still more numerous hangers-on are tenants of some or other of the numerous rooms not far from where the Pope dwells and holds audiences. It is now proposed to erect a large barrack for them near the Belvedere. Opportunity will also be taken to make the galleries more safe, and, in other words, it can be said that a constructive revolution will be accomplished in and around what is, in an historic sense, the most important of all European palaces.

A CURIOUS case was lately heard in the Southampton County Court, where it had been remitted from the High Court. A retired colonel saw an advertisement relating to building with cement slabs at two-thirds of the cost of bricks and mortar. He wrote to the company stating that he desired to make some alterations in his residence. He sent a rough sketch. He was surprised when Mr. CALWAY, who was the inventor of the system and the proprietor of the company, visited him with the surveyor. They came a second time with plans and an estimate amounting to 773*l.* That was double the amount which the colonel expected to pay. He then consulted a local builder who offered to carry out the work for 633*l.*, including grates, which were not allowed for in the other estimate. The company went into liquidation, and the liquidator sent in a claim for 49*l.* 14*s.* for advising on the alterations and additions, preparing two sets of plans and estimates, and travelling expenses. Mr. CALWAY stated in evidence that it was impossible to give an estimate without a survey, which he agreed to make at a cost of 5 per cent. on the outlay. The defendant said he never gave authority to prepare expensive plans, as the descriptive pamphlet stated it would be 1 per cent. of the estimate. The Judge considered that the correspondence between the parties was evidence of a contract, while there was nothing to show that the defendant had demurred to the preparation of the plans. He suggested an arrangement, and finally judgment was entered for 40*l.* and costs. The case demonstrates that it is not economical to dispense with the services of an architect.

ONE of the problems which perplex artists and archaeologists is the *Venus of Melos*. The figure is not according to any of the recognised types of APHRODITE. Some theorists have, indeed, supposed that the woman is a type of Nature, and was derived from a model who did not belong to any exalted class of society. When it was announced a few weeks ago that a reproduction on a reduced scale had been dug up at Delos, it was at once concluded that the mystery would be revealed. But, according to later accounts, the new statue is also deprived of arms. The replica has, of course, to be investigated by experts. At the present day if a restoration of the *Venus of Melos* appeared with any of the dealers it would not be recognised at first sight. If we assume that the figure found at Delos is a genuine antique, it demonstrates that long ago in Greece the imperfect *Venus* was in favour because there was no certainty about its original appearance. But that view does not suit the legend of the discovery of the figure which is now in the Louvre. When unearthed it was accompanied by one arm, if not two. But the officers of the Louvre imagined that the arms did not agree with the figure, and they were consequently suppressed. The discovery at Delos, instead of elucidating the mystery, only darkens it, and we may therefore assume that the disposition of the statue when it left the sculptor's hands will never be revealed to us.

THE INTERNATIONAL CONGRESS.

ALL who desired the success of the first International Congress of Architects, which has been held this week in London, must have regretted the announcement of the improvements committee of the London County Council about the northern line of frontage between Wellington Street and the Law Courts. After careful consideration, estimating and experimenting, it was decided to adhere to the decision of 1903, and consequently no deviation from the official line will be allowed. If the suggestion of the influential architects, members of the Royal Academy, surveyors, bankers and others had been adopted it would enable foreign architects to believe that municipal bodies attached great importance to the advice which was received from architectural societies, as well as from architects who do not belong to them, and other artists.

The main cause of the rejection of the memorials is the loss, which was estimated at 249,400/., involving a reduction of rates or revenue of 4,230/., per annum. But it is also stated by the committee that the obnoxious line was devised by the Royal Institute of British Architects. The improvements committee in their report say:—"We think it right to point out that before the Holborn to Strand improvement as submitted to Parliament was approved by the Council, we consulted the Royal Institute of British Architects, with the result that the scheme which was finally adopted by the Council embraced the suggestions made by the Royal Institute after we had slightly modified the Institute's plan, in order to make the crescent road (Aldwych) connecting the new main street with the Strand more symmetrical."

It will be said that the Further Strand Improvement committee's scheme was an improvement on the original suggestion of the Institute, but the remark of the County Council committee must affect the belief in the infallibility of institutes, societies, or committees composed of architects, and all general recommendations concerning the duties of public bodies or individuals in relation with architects will have to be received with hesitation. If the improvements committee wished to take revenge on architects they could not have adopted a more opportune occasion, for their conclusion is a condemnation of the part taken by some of the most prominent members of the Congress.

On all such occasions it is desirable to have the aid of fortune or accident in providing some item which is not in the programme. Experience has demonstrated that not one of the Congresses which have been held in connection with the Institute of Architects has been advantageous to the members. Expectation was excited, and architects may have imagined they were to derive from the meetings more than it was possible to attain. In the same room or hall or gallery only one paper can be read at a time, and it rarely happens that the readers are elocutionists. When there are several papers to be read at the same meeting discussion is not possible unless in a very abbreviated form. American architects, we believe, continue to go through the formality of responding to their names but then adjourn, and leave the reading and discussion of papers to those who have sufficient endurance to go through that kind of exercise, or a few are told off to sacrifice themselves for delegates who are to be found elsewhere.

At this week's Congress it was not only architects but representatives of the public interests who should have been allowed to share in the oratory, for the peculiarity of the present Congress, and by which it was differentiated from its predecessors, was the extent to which the duties of the non-professional classes of many kinds were laid down. Questions of fees, of modes of training, of history, or of biography were set aside in favour of others which may be described as especially applicable to laymen.

The first in the programme, if not in the order of discussion, related to the duties of municipalities when

ereecting public buildings. The authors of the papers were HERT WAGNER, of Vienna, MONS. OSCAR SIMON and MONS. GASTON TRÉLAT, who controls a private architectural school in Paris. It is a pity these gentlemen did not first define their notion of an English municipal surveyor. On the Continent there is a close connection between a vast number of architects and the State or with municipal councils. They are, so to speak, a reserve force, which can be summoned to perform certain duties, and, indeed, they believe they have a claim to the work. The class of functionaries whom the writers of the papers would exclude probably represent a class inferior to many of our English municipal surveyors. M. TRÉLAT as the director of a school was somewhat more liberal than his associates, and there are parts of his paper which suggest that problems arise in connection with municipal building which the scientific constructor, or, as we should say, the engineer, would best solve.

In dealing with property in designs and drawings M. TRÉLAT also expressed advanced opinions. He believes that the artist's mind is or should be fertile, and that few cases arise where a design can be re-used without more or less adaptation, according to the conditions of the site and other necessities. Señor SALVAT maintained that there should be rights to property in architecture identical with those admitted in material or intellectual property. For the latter we may suppose literature as representative. It is not allowable to introduce in a book anything which gave character to an earlier work. There are keen-eyed people who are always on the look-out for the apparent coincidences between a modern author and a predecessor. BYRON, who was possessed of colossal power, suffered because in his careless fashion he introduced phrases which he had met with in reading. If the rights of property are to be claimed we should start fairly, and act like patentees in describing the arrangements or forms in which an exclusive right is claimed, and which are not found in an earlier building. There is also another side to the question. A client, as Señor SALVAT suggested, would have the right to insist that the architect did not use the design for a different building. Mr. STATHAM's paper related simply to the English law or the English decisions through which a client can claim to have possession of the plans prepared for his building. Here also inconvenience has arisen from the meddling of the Institute, for, as was pointed out, the schedule says that the 5 per cent. commission comprises the necessary general and detail drawings, &c. The value of architectural Congresses is also indicated by the fact that the rule which is so harmful was sanctioned by a conference in 1872. If architects were allowed to make their own arrangements with clients there need be no difficulty about drawings.

It is curious that the only constructional subject treated related to combinations of concrete and steel, in which it is admitted there are few opportunities for the exercise of architectural skill. The papers did not make it clear that the authors had had much experience with that class of work, nor did they explain whether it was possible to have the construction carried out by ordinary builders.

It is devoutly to be wished that the public should be educated in architecture. It would, no doubt, increase their pleasure when looking on buildings, but the question must arise as to the period in which the instruction is to begin and who is to impart it. The debates on the Education Bill, which we have been enduring for some months, made it plain that the children of this country are being over-educated, or rather, over-crammed with knowledge. They cannot take in all that is poured out for them, and, in order to make them more capable, it has been found necessary to give them extra food. Now, for the majority of children, production of some kind will be their way of making a living. The tendency, therefore, is towards what is called secular knowledge, that is, knowledge that will be useful in trades.

One class of educationists maintain that there is neither time for instruction in theology nor the mental power to acquire it without a sacrifice of the indispensable secular knowledge. Is there room for architecture in the curriculum of national education as we understand it at the present time? Professor VON LEIXNER called attention to the fact that the public do not pay any attention to architectural designs or models. According to him they do not understand the plans. It would be interesting to know whether he found the architects who possessed the necessary knowledge are gathered in crowds at the exhibitions of drawings in his country. That kind of spectacle is not afforded either in Paris or in London. As a rule, architects glance at designs furtively through fear they will be suspected of cribbing ideas. So long as architects do not display any open admiration for contemporary designs it is not to be expected that ordinary dilettanti will take as much interest in architecture as in pictures or statues.

Another educational difficulty arose out of the question whether the architect should receive the theoretical and practical training of a craftsman. The late Sir WILLIAM ANDERSON, who was not only one of the ablest engineers of his time, but one who was most often consulted in cases of difficulty by engineers of eminence, used to say that when it was decided he was to be apprenticed to FAIRBAIRN he took lessons in surgery. At that time "first aid" was not popularised by lectures and exhibitions, and he found the benefit of it when accidents arose. Another man under similar circumstances might conclude that a short time with a barrister in studying the law of contracts would be necessary. Others would say that acquaintance with foreign languages was a condition precedent with anyone who had to carry out works in various parts of the world. Whatever knowledge holds good in working is desirable, but since every craft requires at least a couple of years to master it, how is an ordinary architect's pupil to combine it with other branches of knowledge? We must also remember that genuine craftsmen would judge the architect's ability by his dexterity in their particular craft; as in the majority of cases he would be inferior to them they would undervalue his general ability. M. TRÉLAT, who has had more experience than any other author of the papers, says that the advantages are not commensurate with the time that has to be expended.

Connected with the subject is the superintendence of craftsmen. In dealing with important artistic works such as the wall-painting or the statuary of a building, it is well for painters and sculptors to accept the definition of the relation which their works hold to the general scheme. M. NÉNOT acted rightly when he informed the President of the French Republic that if the late BENJAMIN CONSTANT was allowed to paint an immense fresco in the theatre of the Sorbonne, as was desired, he would prevent it by filling the space with some architectural ornament. The question is different when it concerns artisans. The architect's superintendence may be desirable, but who is to pay for it? If there is interference with their workmen contractors will necessarily charge much higher prices. With the additional work the architect's fees would have to be increased. It is doubtful whether the public would be satisfied by the arrangements.

M. BULS has acted so efficiently as the Burgomaster of Brussels that he must be recognised as a great authority on the laying out of cities. He used the familiar line of TERENCE as expressing the spirit of his recommendations, "*Homo sum: humani nil a me alienum puto.*" The words should be liberally interpreted. A city, he says, should not be merely a commercial warehouse or an industrial factory, but "un home humain." In London we seem to think only of traffic, and would drive the homes to other regions. M. BULS regrets the loss of picturesque charm and of national character which has been the result of improvements in cities, but in Brussels he has contrived to

make many relics of antiquity gain in importance, and visitors as well as inhabitants have reason to be thankful that he is no HAUSSMANN who would sacrifice the past in order to create opportunities for cavalry charges against the disaffected.

The Preservation of National Monuments was the subject treated with general accord by most of the authors. M. TRÉLAT, who is somewhat of a revolutionist, considers them to be important elements of public beauty, and their preservation should be undertaken by the Government. Professor POGGI has been advocating the necessity of respect for them in Italy since 1845. M. BESNARD recommended that in case the removal of a monument was imperative photographs and casts should be taken and deposited in the museums. He also recommended the encouragement of costly monographs on particular buildings which might be beyond the enterprise of ordinary publishers.

International competitions may be taken as sign of the good time coming, when universal brotherhood is to be accepted and fostered. But there need be no more precautions than are necessary in ordinary competitions. Indeed it may be doubted whether judges and assessors of several nationalities are needed. Architecture is a universal language and can appeal to men of all lands. We can hardly believe it was necessary for BURGESS to produce drawings in so antiquated a style as to deceive VIOLETT-LE-DUC until he saw the water-mark "WHATMAN" on the sheets. The treatment was more likely to be due to BURGESS's love of antiquity than to any other cause.

A short time ago the question of registration in one form or another would have been considered the most important of all the questions brought before the Congress. There is no denying the change, for it has become doubtful in what manner to restrict architectural commissions to a limited number of architects. When BURGESS asked a cook in Lille (we may be allowed to again refer to him) how long it would take to learn the art of cookery, the man replied, "With a fine art like mine, monsieur, one is never master; one has to be continually studying." The knowledge which will prepare a man to pass such an examination as will be required by an Act of Parliament would not make him a complete architect, although legally he would be entitled to practise and to express an opinion which practical builders would have to respect. The managers of the Congress, accepting things as they are, relegated the discussion of the diploma question to Saturday, when, to use a common expression, "all the fun of the fair will be over," and even earnest Congressites will be asking with the Lotus Eaters, "Why are we weighed upon with heaviness? Why should we toil who are the first of things?" The International Congress is not likely to do much towards the passing of Registration Bills.

THE REMBRANDT TERCENTENARY.

THE people of Holland have been true to themselves in celebrating quietly but worthily the three hundredth anniversary of their great countryman, REMBRANDT HARMENS VAN RIJN. Because he stands among the greatest painters of the world, Holland must always be proud of such a son. But there are other reasons for remembering him. REMBRANDT, to many of the people of the staid Amsterdam, was during his life an irregular, extravagant and often an impecunious citizen, but all must now realise that he resembled a star and was an indication of the beginning of a new era for the country.

If we turn to the diary of JOHN EVELYN, which is so valuable for information about art in the seventeenth century, we learn that in 1640 he left England, partly through fear of the impending breach between the Crown and Parliament, and partly with the

intention of serving as an agent of CHARLES I. He was a refined amateur, and he tells us that when he saw the landscapes and drolleries which were exhibited at the fair of Rotterdam he was amazed at what he called "clownish representations." The pictures were cheap, and were produced in such large quantities that even the farmers used to invest in them as a commercial speculation. He saw a great many curiosities in Amsterdam, but it is remarkable that he does not mention a painting of any account as existing in the city, although at the time REMBRANDT had produced several masterpieces. Even at The Hague he acquired an "excellent drollery" by COVENBERG, an artist who had painted the *Rape of Ganymede* on the ceiling of the Prince's palace. Prejudice is difficult to overcome, and amateurs like EVELYN could not believe that a Dutchman could be a great artist.

The absence of information in EVELYN's diary may be taken as evidence as to the low state of art prior to his time. Holland was long without an independent existence. The land which had been created with such difficulty was by some confounded with Belgium, and was really part of the possessions of the Duke of BURGUNDY, when it fell into the hands of the Spaniards. If a native of Holland arose who possessed ability as an artist he sought patronage in Bruges or Antwerp. It is therefore difficult to make out the early history of the Dutch school on account of the impossibility of distinguishing between the painters of the Northern and Southern Provinces.

Under the guidance of the House of Orange the Dutch Republic arose, and the sense of liberty must have produced a remarkable effect on art and artists. MIREVELD, who was born in 1567, is said by one authority to have painted 5,000 portraits of his countrymen, whilst another biographer puts the number down at 10,000. It would now be impossible to count the number of portraits which FRANS HALS painted, but numerous examples show signs of expedition, as if several men were waiting impatiently in his studio for their turn to be represented. The love of portraiture suggests a desire for reality, and the Dutch landscapists might be described as the portraitists of Holland, its green but monotonous fields, its long avenues, its windmills, its canals, towns and other examples of Dutch industry. The people emancipated themselves not only from Spain, but from the religion the Spaniards would impose on them. An artist could not expect to obtain commissions for painting the walls of churches as in Italy, for the Puritanic people covered with whitewash the walls which were decorated, and might on that account be supposed to be indifferent to art. But compensation was to be found in the patronage for art of a domestic kind. Dutch pictures were therefore produced in order to be hung on the walls of rooms, and were generally of limited dimensions.

When therefore REMBRANDT, after leaving the jurisprudence classes of the university of his native Leyden, and after an imperfect training under a couple of artists, began to paint the portraits of his townsmen, the prospect before him was sufficiently encouraging. His removal to Amsterdam when he was about twenty-five is evidence of a demand for his works. As well as can be made out, he was at once successful in his new home. If the famous *Lesson in Anatomy* was produced in 1632, as was likely, it suggests that a class of men who desired to be surrounded with mystery arranged with him for a representation of a dissection, a kind of inquiry which was not altogether in favour. They could not resist to be immortalised by his pencil. The work is so effective that we can almost imagine what TULP, the operator, is maintaining, and the degrees of attention to his words are suggested with impartiality. It may be described as a work in black and white, and those who begin their acquaintance with REMBRANDT's works by seeing it in The Hague gallery are to be excused if afterwards they have a preference for that mode of treating a picture.

Amsterdam can afford a delightful spectacle when there is sunshine, but the colours to be seen do not correspond with those of Venice. The Dutch people in the seventeenth century were more soberly clad than those of the South. But REMBRANDT also painted pictures which are more dazzling than those of Venetian painters. Through what causes he allowed his imagination to have ample liberty in displaying a peculiar kind of colouring cannot be explained with any certainty. Although he had passed through the Latin school and was a university student, REMBRANDT was no writer of books or letters. It is only therefore mere guesswork to try and discover his practice.

It is not irrational to suppose that as he was well acquainted with many of the numerous Jews who lived in Amsterdam, and even in the same street with the painter, REMBRANDT may have been able to enjoy the sight of textiles which were produced in Eastern looms and of jewellery which once belonged to queens and princesses. JAMES BARRY, who was opposed to all men who were indifferent to the "gusto grande," like REMBRANDT, supposes that the Dutch artist must have seen examples of the Venetian school. Nothing, says BARRY, "can exceed the beauty, freshness and vigour of his tints. They have the same truth, high relish and sapidity as those of TITIAN. Indeed, they have the closest resemblance to the hues of TITIAN when he had GIORGIONE most in view. There is identically the same attention to the rilievo and force obtained by his strong shadows and low deep tones." REMBRANDT's love of costume has created one of the difficulties which prevents a satisfactory interpretation of the so-called *Night Watch*. The Dutch soldiers of the present day are enough to horrify an English or German sergeant, but there is at least some recognition of uniformity in dress, and whether we consider the members of the Guard as belonging to a particular company or as units of other companies, the variety of their costume is unaccountable, and as if to add a climax to the variety the artist has introduced the figure of a little girl who is dazzling in her bejewelled robes. It is no wonder some of the volunteers rebelled against the manner of representing them, for they failed to recognise the right of a painter to treat them as mere elements of a coloured scheme.

REMBRANDT was to be pardoned if, on seeing rich costumes and ornaments, he resolved to possess them as if they were properties which could always serve for models. His house contained much which was costly, but the Dutch folk of that time could not understand the ardour which compelled a man to exceed his income for the sake of such vanities. He obtained forty thousand guilders with SASKIA UILENBURG, and, judging by the portraits, they were a happy couple during the six years they lived together. But the wife's trustees seemed to consider that the fortune was not to be expended and on SASKIA's death it was to be paid over in full to their son TITUS. His supposed improvidence was not favourable to winning the estimation of his countrymen, and all that is known of him suggests that after his wife's death he lived amidst financial difficulties. Before his death he had to endure the neglect of the Amsterdam people, who preferred the skill of younger men.

REMBRANDT, besides painting pictures which would not be too large for the houses of merchants, further popularised art by means of his etchings. With them he could allow himself more freedom than on canvas in experiments with light and shade. The subjects of some were no doubt imaginative, but others were records of landscape scenes which were familiar to him and his friends. They suggest by their *finesse* that his hand was as delicate with the needle as it was vigorous when painting. His work on copper must often have diverted his thoughts from oppressive matters.

We have mentioned that EVELYN was in Amsterdam in 1640 when REMBRANDT was likely to be occupied with the *Night Watch*, yet he never mentions the artist's name. During many years there was no less indifference

to the painter and his works. RICHARDSON visited Holland in the early part of the eighteenth century, and he informs us that in Amsterdam "Mynheer VANDER SCHILLING has several pictures, but chiefly of Dutch and Flemish masters." There is no mention of his seeing a work by REMBRANDT in any of the towns he visited. REYNOLDS often referred to RUBENS and other Flemish artists, and he does justice to FRANS HALS. But all he found to admire in REMBRANDT was the absolute unity of his manner of treating light and shade, which, he said, consisted in having one spot of light in the midst of a large quantity of shadow. In another discourse he said that the Dutch artist appears to have used the palette knife to lay his colours instead of the pencil. In no parts are the painter's works recommended as objects for study. It was to be expected that the early professors of the Royal Academy should take their cue from the first President. FUSELI described REMBRANDT's figures as "swampy excrescences," "uniform abstracts of bumpy or meagre deformity." He admits that REMBRANDT was endowed with a gigantic but barbarous genius. BARRY also condemns "the obtrusive, licentious, slovenly conduct of his pencil or his trowel, which he is said to have used." It is worth noting that of the examples of REMBRANDT in the National Gallery, *The Christ Taken Down from the Cross*, once belonged to Sir JOSHUA REYNOLDS, and the portrait of *An Old Lady* was in the collection of Sir CHARLES EASTLAKE, who was also a president of the Royal Academy.

REMBRANDT has, in spite of opponents, gained an exalted position in art. Men of all nations took an interest in his tercentenary. His countrymen may have helped to increase the interest of the work with which he is mostly associated by erecting a special gallery which will resemble the hall for which the large *Night Watch* was ordered. It was pointed out in this Journal several years ago that the room in the Ryks Museum which contained the work was so lighted as to cause some confusion in the colours. The new room is lighted from the side, and under the conditions the painting appears to be improved. REMBRANDT was an experimenter, and it would be an advantage if all his works could appear under similar conditions as those adopted by him when painting them.

LIABILITY UNDER A LESSOR'S COVENANT TO REPAIR.

By Professor W. S. HOLDSWORTH, D.C.L.

THE moral of the case of *TORRENS v. WALKER* is that it is legally inadvisable (as well as practically inconvenient) to become the lessee of a house in a tumble-down condition, even though the lessor covenants to keep the outside of the premises in good and substantial repair. In the case in question the plaintiff leased from the defendant's predecessor in title the three upper storeys of a house in London, to be used as a private hotel. The lessee was to do the inside repairs, the landlord the outside. On July 13, 1905, the London County Council served on the premises a notice under the London Building Act that the premises were in a dangerous state, and requiring the front and back walls to be taken down in so far as they were broken, decayed or out of form. The plaintiff (the lessee) at once informed the lessor (the defendant) of the service of this notice. The notice was the first intimation that either the plaintiff or defendant had had that the building was in a dangerous state. In the following August all the guests staying in the hotel were given notice to leave, and in November, under a magistrate's order, the walls were pulled down and the premises became uninhabitable. On these facts it was held that there had been no breach of the lessor's covenant to repair. The decision will no doubt surprise lessees, and it is therefore the more important that they should understand its grounds, that they may escape a similar fate. It was

held (1) that the obligation of a covenant to repair attaches when and only when the lessor has notice that the building is out of repair. Till the notice has been given he cannot be held liable, so that in this case the landlord's liability did not attach till July 13, 1905. And it should be observed that this rule as to non-liability before notice applies whether or not the covenant provides anything as to the necessity of giving notice to the landlord. The reason for this rule was very clearly explained by BRAMWELL, B., in another case. He said that it was absolutely necessary to interpret a landlord's covenant to repair as a covenant to repair upon notice—otherwise a landlord might be bound to keep in repair that of which he has no means of ascertaining the condition. It was held (2) that the extent of the obligation of the landlord's duty to repair depended on the state of the house when it was let. In this case the house was nearly 200 years old when it was let. It was practically a worn-out house, and it could not have been put into a good state of repair by any measures short of taking-down and rebuilding. Several cases have decided that when the lessee covenants to deliver up a house in a good state of repair, the extent of his liability must be measured by the state of the house when he leased it. He is not bound to deliver up a new house when he leased an old one. "With regard," it was said in another case, "to the walls, the floor, the doors, the windows and all the different parts of the house, the tenant is bound where there is a breakage . . . to repair it to the best of his ability; but he is never bound, when a portion of the structure has become absolutely worn out and necessary to be replaced, to substitute a new structure in the place of it. All that he undertakes to do is to patch the thing up so long as it is, in the nature of things, right and reasonable that the thing should be patched up. But when it has got to such a state that patching up is of no avail . . . then the tenant is not bound to put in anything new, or to pay any proportion of the cost of putting in the new thing, because the old one has become unfit to discharge its duty." What is law for the lessee is law for the lessor. The house in this case was when leased in such a state that repairs were impossible. The only thing that remained to do was to rebuild; and this was no part of the lessor's obligation under his covenant to repair.

TRANSVAAL INSTITUTE OF ARCHITECTS.

A MEETING between sub-committees of the Institute of Architects and Master Builders' Association was recently held in the Institute Room, Provident Building, to discuss the new drainage by-laws which will shortly come into force. Mr. J. F. Beardwood presided, and there were also present Mr. Granger Fleming and Mr. Seton Morris, of the Institute of Architects, and Messrs. R. S. Seago, Thos. Clark, A. Moig and J. J. Jowett, of the Builders' Association.

For several weeks both Societies have been formulating amendments to various clauses in the proposed by-laws, and the object of the meeting was to enable architects and builders to thoroughly discuss their respective amendments before sending same to the municipality. The meeting, which lasted nearly three hours, was practically unanimous on the majority of points discussed.

The Following Minute has been sanctioned by the Treasury:—"Their Lordships are pleased to declare that for the due and efficient discharge of the office of keeper of the National Gallery of British Art at Millbank, professional and other peculiar qualifications not ordinarily to be acquired in the public service are required, and that it is for the interest of the public that persons should be appointed thereto at an age exceeding that at which public service ordinarily begins. Their Lordships are at the same time pleased to direct that any holder of the aforesaid office be entitled to superannuation, but without any addition of years, although he may not hold his appointment directly from the Crown, and may not have entered the services with a certificate from the Civil Service Commissioners."

INTERNATIONAL CONGRESS OF ARCHITECTS

SEVERAL congresses of architects have been held in London in connection with the Royal Institute of British Architects. This is the first year of an International congress of architects in London, being the seventh of the series. It was arranged that the subjects for discussion were to be:—

1. The Execution of important Government and Municipal Architectural Work by Salaried Officials.
2. Architectural Copyright and the Ownership of Drawings.
3. Steel and Reinforced Concrete Construction.
4. The Education of the Public in Architecture.
5. A Statutory Qualification for Architects.
6. The Architect-Craftsman: How far should the Architect receive the Theoretical and Practical Training of a Craftsman?
7. The Planning and Laying-out of Streets and Open Spaces in Cities.
8. To what Extent and in what Sense should the Architect have Control over other Artists or Craftsmen in the Completion of a National or Public Building?
9. The Responsibilities of a Government in the Conservation of National Monuments.
10. The Organisation of Public International Architectural Competitions.

The order followed was different.

Monday, July 16. Preliminary Meeting.

THE Congress opened on Monday morning by a well attended informal reception by Mr. J. Belcher, A.R.A., at the Grafton Galleries. The visitors were much interested in the large collection of architectural water-colours, drawings and photographs which have been hung on the walls and on screens, as well as in the collection of furniture, silver, &c., downstairs. To avoid confusion, the delegates were instructed to apply for tickets, &c., at the special tables over which the name of their country was inscribed. The arrangement worked admirably.

The formal inaugural meeting took place at the Guildhall in the afternoon. Her Royal Highness the Princess Louise and His Grace the Duke of Argyll, K.G., were received by the executive committee and the ladies' committee. The chair was taken by the Right Hon. the Lord Mayor of London, who, after a few words, vacated it in favour of the Duke of Argyll, the chairman of the meeting.

Mr. JOHN BELCHER, A.R.A., president of the Royal Institute of British Architects, was then called upon to read the following presidential address of welcome:—

Presidential Address.

As President of the Royal Institute of British Architects I have the honour of being invited to preside over the work of this the seventh International Congress of Architects, and on behalf of the executive committee I take the earliest opportunity to heartily welcome the distinguished delegates and architects who have honoured this country by their presence, and to assure them of our high regard and esteem.

Gentlemen, I have every hope that our deliberations will prove of great interest and value, and will tend to the advancement of our beloved art throughout the world. It is by interchange of ideas, comparison of methods, and the statement of experiences under new and changing conditions that that advancement will be assured. These Congresses, therefore, may be expected to bring in their train fresh life and vigour, increased enthusiasm, broader views, and new ideas which cannot fail to benefit the community at large.

I say "community" advisedly, because the fact is beginning to be recognised that architecture as a fine art is not, or must not any longer be, one of the luxuries of the rich, but is of vital importance to the physical and moral wellbeing of all sorts and conditions of men, especially in cities and large towns. Environment is a tremendous factor in education and development. A man's surroundings have enormous power over him, whether for good or for evil; a power that acts continuously, without cessation—almost, we may say, by day and by night. This fact is being more and more clearly recognised every day, and efforts, we hope, will be made to introduce a stricter supervision over buildings of every kind, that a better order of things may gradually be created. But here, at the very outset, we are confronted

by a popular misconception concerning the true nature of architecture. In past years public interest has been almost limited to the scientific side of the question, viz. that houses and other buildings should be well built, sound and wholesome; that drainage and ventilation should be carefully attended to, and other so-called "practical" matters. Occasionally, and more frequently of late, a certain amount of ornament and so-called style has been demanded, and this has been thrown in or daubed on afterwards, and the result dignified with the name of Architecture. Such work is not true architecture at all. It is mere building—sound and good perhaps, but still mere building, plus certain ornamental and decorative features. Now, if our architecture is to be an elevating and refining influence, if it is to be an enduring power for good, still more, if it is to be a witness to coming generations of earnest purpose and high aspirations, of moral power and intellectual greatness, the artistic element must not be something merely added: it must interpenetrate and blend with scientific knowledge and experience from the very first.

Architecture is both a science and an art, and the mathematical symbol of the relation between the two is not that for mere addition (+), but for multiplication (×). In other words, science supplies the facts and the laws which art takes and presses into the service of noble ideals. The scientific and artistic elements in a good building may perhaps to a certain extent be distinguished, but they cannot be separated: they are as inseparably connected as mind and body.

The primary motive for all building lies in the practical needs of life, in the demand for shelter and comfort; but the architect's work calls for a much wider range of thought and purpose than is necessarily implied in such provision. If the task entrusted to him is to be honourably as well as adequately fulfilled he must be an artist, with an artist's motives, aspirations and ideals, as well as a man of practical skill and scientific knowledge. In this way the elementary necessities of life may be made to serve high and noble ends, and much that is elevating and refining may be brought into the lives of the people as a silent but continuous power for good. Their homes, the streets they traverse and the buildings they work in may all be made, as Lord Leighton once observed, to contain "the fire-germ of living beauty," quickening and invigorating the deep springs of health and joy. The proceedings of this Congress and the publicity attaching to them will help, we trust, to bring this important subject into greater prominence, and we shall, I am sure, find, as we have often before found, the public Press most ready and most powerful in helping on anything that concerns the common weal. It may, perhaps, be as well here to inform those of our honoured guests who are not yet aware of the fact that in this country we have no Minister of Fine Art or similar authority to watch over the interests of the public in this respect of the art, as distinguished from the science of building. We have a First Commissioner of Works, it is true, but, however able and enlightened he may be, tradition and custom limit his activity and his authority within certain fairly well-defined lines.

There has been, however, of late amongst the educated portion of the public a wonderful awakening to the interest and value of architecture as a fine art. On all hands we discover a receptive spirit, a disposition to inquire and a readiness to learn something of the mystery of our art, not merely to admire and study its past achievements, but, treating it as a living art, to ascertain its true functions and vital principles. Everywhere intelligent men are asking how they may distinguish between good and bad, and asking, too, why this is good and that bad.

We are taking steps to supply the public with some simple criteria of a general character which may serve as a basis for the formation of a critical taste and sound judgment; and the question of how best to carry this out is a subject that will come before the Congress for consideration and discussion.

If we can thus give the public an insight into some of the living principles of our art—and here I beg to emphasise the word "living"—we shall unlock to them a veritable storehouse of interest and information. For no man has a richer field lying before him for exploration and research than the man who takes an intelligent interest in architecture, who can appreciate its points and decipher its meaning. Everywhere, at every turn, he finds a new "subject" to exercise his perceptive and reflective faculties

upon. Every truly good work will be to him a fund of information as well as a revelation of character and purpose. He will read the mind of a people in their buildings and understand the social conditions that prevailed in each age. For all true architecture is instinct with life, the life of its people and of its age.

We may study the thoughts and purposes of past generations, not only in their poetry and their prose, but also in the architectural work that they leave behind them. No historian's verdict is more reliable than that which is written as with a pen of iron in brick and in stone. How much have we learnt of the brilliance of Greece and the majesty of Rome from the monuments of their architecture that have survived. So also our buildings tell of our daily life and doings, of our noble aims or our sordid interests, of our broad, large-hearted views or of narrow-minded selfishness. A private residence is an index to the character, tastes and disposition of its owner. So, too, our public buildings will declare aloud to after generations the ideals and sentiments that govern our municipal and national life. The educational value and historical interest and importance of architecture are enhanced by the fact that, unlike literature, architecture is cosmopolitan and universal in its language: its great works, its priceless treasures are open to be known and read of all. Every nation, it is true, has its own accents and its peculiar idioms even in architecture, but this is to be counted for a gain rather than a hindrance by the man who visits other lands. As he travels from one country to another, or even from one city to another, he finds an infinite diversity of expression, throwing an ever-shifting light upon the various aspects and sides of human life and thought and feeling. Many a record of the past, too, is opened to his eyes, speaking of men and manners that have passed away. The study of architecture may, indeed, be made one of the most entrancing of pursuits, but if it is to be delivered from that touch of pedantry, that archæological flavour that so often clings to it, the student must be brought into contact with living principles. The monuments of the past, as well as the work of to-day, must be read and judged in the light of those principles that hold good for every age and for every nation.

In addressing my brother architects from other lands—and I am proud to see so many distinguished men amongst them—I may venture to point out that our architecture, like that of other nations, has a distinctive character of its own, being of a severer and graver type than is found elsewhere. This is partly accounted for by the dull grey atmosphere which so constantly wraps us round, by the comparative rareness of clear and sunny skies and our generally unfavourable climatic conditions; but I am afraid we must not throw all the responsibility upon nature. We are insular in character and disposition—there is no doubt about it—and more so perhaps as individuals than in our corporate life. Every man is his own island—a sort of moated grange, in fact, with the drawbridge habitually raised. We are reserved, and apt to shut ourselves up within ourselves. In our railway trains, and even in our clubs, we sit apart in silence, or merely throw remarks at one another over the top of the morning paper. We habitually repress our emotions and hide our feelings. Naturally, therefore, our buildings also are often stolid, even grim and forbidding in appearance; they lack the charm and brightness which distinguish the architecture of other and sunnier lands. We hide them away too—in back streets or (if they be in the country) behind high walls and as many trees as we can press into the service.

But let me hasten to add that I have a purpose in speaking of these external characteristics of British architecture, and that is to beg my illustrious *confrères* from abroad not to stop at the external features, but to pursue their researches a little further, and they will find set forth in our buildings another characteristic of the people of the land they are honouring with a visit. Under a somewhat grave and sedate appearance it will be found that our people possess warm hearts. Once within the doors of their houses there will be no lack of a heartiness of welcome and a sincerity of goodwill which may be firmly relied upon. The many mansions and other beautiful residences with which our country abounds reflect this deeper element of our hearts and lives, and will be found worthy of your notice. I believe it is generally agreed that our modern domestic buildings present a noteworthy development of our art, and one that is almost peculiar to this country. We cannot show you streets leading to public buildings of such stately character as may be seen and admired in other great cities of Europe, and our public buildings themselves are consequently at a

disadvantage. The new approach to Buckingham Palace and the memorial to Queen Victoria—designed by Sir Aston Webb—show what might be done if only such opportunities were more frequently given. Had Sir Christopher Wren been allowed to carry out his plans for laying out the City after the Great Fire, there would have been no lack of fine streets to show you, or of splendid vistas opening up to view every building of importance. But there was no Minister of Fine Arts to turn the scales in favour of an enlightened policy.

Having drawn attention to some of the features and conditions of British architecture, let me acknowledge, on behalf of my countrymen, how much we have learnt from, and how much we have profited by, the many splendid examples of architecture which are to be found and admired in your respective countries. We naturally and instinctively turn to the south for that which is bright and beautiful. The warmer temperament of the southern artist is favourable to productive fancy. We see that the nations amongst whom the love of beauty is a national trait, instinctive and inherited, seek it in all their works, and set forth their national greatness in their public buildings—an element in the education of the people which no Government can afford to despise. The union of the arts in which we believe the secret of your success to lie is not so advanced amongst us as with you; but signs are not wanting even here of the growth of a closer bond between them, and architects and sculptors will be found collaborating on a building to present its distinctive purpose with greater clearness and beauty before the eyes of men. The utilitarian cast of mind, running ever in its one groove, may laugh or even sneer at this; but from a national as well as humanitarian standpoint there can scarcely be a greater mistake than to overlook and neglect the emotional side of man's nature. The greater the advance in civilisation, the more pressing the claim of the emotions of the people to due recognition and well-balanced development on true and right lines. Feats of engineering, appealing to the intellect, astonish but do not move us; but works of beauty, buildings of graceful proportion and appropriate design lift the beholder above the vulgar and commonplace into a higher region, and fill the heart with lofty ideals and pleasurable emotions.

The aim and purpose of the Congress is the welfare of the people. This can only be accomplished by raising the ideal both of architects and the public by setting a higher tone and proposing a nobler end for all work, and thus lifting that which would otherwise be blankly material, utilitarian and commonplace into the region of the beautiful, the elevating and the inspiring.

In conclusion, permit me once again to offer you all a heartfelt and most cordial welcome. I trust that the Congress will be a great success, and that your visit to London will prove both a profitable and an enjoyable one.

SIR ASTON WEBB said he had been asked to propose a vote of thanks to the Corporation of the City of London for their very great kindness in lending the Congress the Guildhall for the purpose of their inaugural meeting. The first hall was built in 1211, rebuilt in 1320, and built once again in 1411. It suffered considerably at the Great Fire, and later from the misguided zeal of George Dance. The hall was connected with the great names of latter-day history and steeped in associations. It was for that reason that it had been selected for the inaugural meeting of the Congress.

The vote of thanks was acknowledged by the Lord Mayor.

Mr. W. J. LOCKE, in his official report as the secretary of the Congress, stated that never before had the full privileges of an International Congress of Architects been extended to ladies. It was believed that every practising architect had had conveyed to him notice of the Congress. There were an unprecedented number of members, the total being nearly 1,700, and of these about 700 came from abroad. Although the British Government were unable to send invitations to the various other governments and practically stand aloof, official representatives have been despatched from other countries.

Replies were made by the representatives of the following foreign countries:—Professor Otto Wagner, Austria; Monsieur J. J. Caluwaers, Belgium; Etatsraad Vilhelm Dahlerup, Denmark; Mynheer J. T. Cuypers, Holland; Monsieur H. Daumet, France; Herr H. Muthesius, Germany; M. A. Metaxas, Greece; Monsieur J. Berczik, Hungary; Professor D'Andrade, Italy; Mr. S. Chujo, Japan; Senhor Ventura Terra, Portugal; M. R. Böker, Russia.

Señor Don Velasquez Bosco, Spain; Professor Clason, Sweden; George B. Post, United States.

Herr H. MUTHESIUS, speaking on behalf of Germany, said that architects had come in great numbers from his country because of the deep interest they felt in English architecture and English art, and also in the hope that this good understanding may be furthered by the Congress. He considered that there is that in contemporary English Domestic architecture that will revolutionise the art of all civilised countries. He ventured to express a wish that arrangements might be made whereby the delegates from abroad might be allowed to visit some selected specimens of modern English houses.

Mr. S. CHUJO, speaking on behalf of Japan, expressed a hope that the time might not be far distant when the Congress would hold their meeting in his country, where he could promise a hearty welcome.

Mr. GEORGE B. POST recalled the time when an architect was considered as a person of absolutely no consideration in America, even in the character of engineer. All that has been changed. To-day they are the arbitrators in all matters of taste, and they have secured the respect of the community. They have organised great architectural societies, and classes of instruction that are in operation throughout the length and breadth of the land.

His Grace the DUKE OF ARGYLL in his inaugural speech said that from the conciseness of the speakers who had just replied on behalf of their respective countries, it was not unnatural to suppose that they were capable of designing a house in five minutes. There were doubtless at this time of year many things to be done by everybody, so that it was unfair to make any considerable demand on their precious hours. He would like to give a most emphatic welcome to all the members of the Congress, and in this he was joined by the Princess Louise. Her Royal Highness was certainly more intimately connected with sculpture than architecture, but she was deeply interested in all forms of art. Everyone should feel obliged towards the members who came from abroad to visit this country. His own experience told him that it is the greatest of pleasures to talk to architects and one of the greatest delights is to erect buildings, most especially when there is the national or municipal purse to fall back on. But the architecture of the past, and above all of foreign lands, can give extraordinary pleasure to all who behold it.

Mr. JOHN BELCHER then proposed a vote of thanks to Her Royal Highness Princess Louise and the Duke of Argyll. Prior to leaving the platform the foreign delegates were presented to the Princess by Mr. Locke.

Tuesday, July 17.

A section of the Congress met at the Grafton Galleries on Tuesday morning to discuss questions relating to the new form of construction. Mons. J. J. Caluwaers (Belgium) was chairman, supported by Mr. Frank Miles Day (president of the American Society of Architects), who undertook the control of the proceedings. Mr. F. N. Jackson acted as hon. secretary.

STEEL AND REINFORCED CONCRETE.

JOINT REINFORCED CONCRETE COMMITTEE.

THE great and increasing use of reinforced concrete in buildings and other structures, and the need of having some authoritative pronouncement on the proper conditions of its use, have led the Royal Institute of British Architects, with the co-operation of other bodies, to appoint a committee to inquire into the subject.

The aim of the committee's deliberations is to prepare a report, stating their recommendations and conclusions as to:—

1. What drawings and details should be prepared before work is commenced.
2. The nature of the materials which may be employed, and the standards to which these should comply, i.e.:—
 - (a) The metal in reinforcement.
 - (b) The matrix.
 - (c) The sand.
 - (d) The gravel, stone, clinker or other aggregate.
 - (e) Water.
3. What are the proportions for concrete to be used in different cases.
4. How the ingredients for concrete are to be mixed and deposited on the work.
5. The distances to be allowed between the reinforcing bars and what covering of concrete is necessary.

6. What precautions are necessary in the design and erection of centring and false work, and how long the whole or portions of centring and false work should remain in position.

7. The rules which should be used in determining the dimensions of the several parts necessary for security, and what safe stresses should be allowed.

8. The supervision necessary and the special matters to which it should be directed.

9. The fire-resisting properties of reinforced concrete.

10. Its adaptability for structures where resistance to liquid pressure is essential, and what special precautions may be advisable under these conditions.

11. What are the necessary conditions for its permanence; resistance to rusting of metal, disintegration of concrete or effects of vibration.

12. The testing of the materials employed and of the finished structures.

13. What provisions are desirable in building laws or Government regulations relating to buildings and other structures, so far as these affect the use of reinforced concrete.

The committee having been recently constituted and only two meetings having been held, no conclusions have been arrived at, and members of the Congress are invited to send communications, either the results of experiments or other information or suggestions that may be of use.

By HENRY ADAMS.

In early designs no provision whatever was made to resist the shearing stresses, which were either overlooked or ignored, and it is interesting to observe the gradual recognition these stresses obtained in the hands of the designers, until in recent construction they receive nearly as much consideration as what are called the "direct" stresses of tension and compression. The importance of considering shear was brought prominently under notice by the failure of experimental beams which had no special provision for meeting the shear stress towards the ends, where of course it is greatest. Various methods are employed in the different systems, but the Kahn trussed bar seems peculiarly suitable, the fin on either side of the core being left attached throughout the middle portion where the tension is greatest, and separated and bent upwards towards the ends to take the shear where the tension is least.

The question of adhesion between the concrete and the steel at one time caused some anxiety. It was naturally supposed that with increase of temperature the steel would expand more than the concrete, and it was thought that this would be sufficient to impair, if not to destroy, any adhesion that might be otherwise obtainable. As a matter of fact the linear change for a given variation of temperature is about 15 per cent. less for concrete than for steel, but when the actual figures are compared the difference is very trifling. Taking the range of temperature between summer and winter as 70 degrees Fahr., the change of length in 100 feet produced by this variation of temperature will be for steel 0.546 inch and for concrete 0.464 inch, the difference between the two materials in a length of 1 foot being less than a thousandth of an inch.

With equal care in mixing the concrete the adhesion varies with the condition of the surface of the steel. When coated with red oxide paint it is extremely light, and even a bituminous paint reduces the adhesion below that due to a clean unprepared surface. It is, however, found that the best adhesion occurs when the steel is rusted all over before being embedded in the concrete. This appears to be due to the formation of some chemical compound, or salt of iron and lime, which may not be detrimental in the absence of further moisture, but the final result is doubtful in such cases as reservoir walls, tanks and dams. Painting the steelwork over with cement wash is a simple method of commencing the contact, and this would seem to prevent further rusting, on the principle of the pail of limewater into which the Sheffield grinders dip their small goods to resist the tendency to rust when left wet.

Professor Bauschinger found the ultimate adhesion to be from 569 to 668 lbs. per square inch, but Mr. J. S. Costigan found it not to exceed 65 lbs. per square inch. Probably in the former case it was measured by the resistance of a rod to withdrawal, and in the latter by the insertion of small plates in a briquette. At any rate, it is not safe to reckon upon more than 50 lbs. per square inch as a working load for adhesion. Allowing 16,000 lbs. per square inch as the working load on steel, the embedded

length that would make the strength and adhesion equal would be 16,000 times the sectional area of steel in square inches divided by fifty times the surface area per inch in length, or briefly $320 a \div s$; so that a quarter-inch square bar embedded for a length of 20 inches would be equally strong against tearing or slipping, and similarly a 1-inch square bar would need to be embedded for a length of 80 inches. There are many different constructions in which this fact may be of importance; for instance, in a simple beam, if the span is less than twice the above lengths, there will be a tendency for the rod to draw before the tensile strength is utilised, unless the ends are turned up to form cleats. In the edge of a circular ferro-concrete tank, instead of overlapping the ends of the rods, for which the above distance would be a minimum, it would clearly be more economical to turn up the ends and slip a welded link over them. There are several specially prepared bars giving greater resistance to withdrawal, e.g. the Ransome twisted bar, the square corrugated bar and the Columbian bar, which relies for efficiency upon its large surface area compared with its sectional area, but plain rods which can be obtained everywhere should be adopted whenever possible, on the score of economy and avoidance of delay.

Ferro-concrete does not at first sight lend itself readily to architectural effect; the warehouses and coal stores constructed of it can hardly be called visions of beauty, but some of the recent arched bridges have a decidedly pleasing effect, and when the adaptability of the compound material becomes better known we may confidently look forward to the expression of taste as well as utility in the designs.

By E. P. GOODRICH (America).

Associations of insurance companies in the United States have had the effect of standardising requirements. All the most important points thus developed were carefully considered in the design of the Bush factories, which thus were provided with special fire walls, special stair and elevator shafts, waterproof floors, automatic fire doors, a complete sprinkler equipment, windows of wire glass in metal frames, &c.

The reinforced concrete design was prepared with special care as to the fire-resisting qualities of the structure. A "unit" system of reinforcement was devised, which proved effective and economical, not liable to derangement during construction, and especially advantageous because allowing of the use of special fire-resisting materials at points of greatest danger. The columns, even though built of concrete, were fireproofed with cinder concrete shells, which served at the same time as a vehicle for the steel reinforcement and as a mould for the construction of the main body of the column.

The building now completed enjoys the lowest rate of fire insurance, both as to structure and contents, accorded any similar risk.

By Professor LOUIS CLOQUET (Belgium).

The old-style edifice was characterised by the separation between two distinct parts, the walls and the gable. There is a lack of solidarity between the two. At the point where the trusses of the frame rest upon the walls there is something like an articulation. The introduction of the metallic frames has not at once remedied this characteristic defect of buildings formed of stone walls and gables of wood. For a long time it was customary to combine trusses of iron similar to the wooden trusses. The solution of the problem of the large halls only made a decisive step in advance when the centred trusses were introduced, which have their starting-point on the ground, like the trusses of the Dion pattern. From that moment the solidarity between the vertical and the inclined parts was secured. However, it is only the trusses which cannot be deformed. The solidarity between the vertical and the inclined parts is not realised in the enclosing surfaces. There is lack of homogeneity between the two parts of the building, that is to say, its skeleton or frame and its wall. Logic claims a more radical solution, which would consist in establishing solidarity not only between the uprights and the trusses, but rather between the wall and the roof. This is what the use of reinforced concrete enables us to realise. The side wall may even disappear or be made one with the vault. The whole will show almost uninterrupted surfaces on the outside as well as on the inside, with the absence of the encumbering internal protrudings of the frames. The new arrangement has, therefore, as a result to save the trusses, and only

to maintain a surrounding wall which supports itself without any assistance. Now experience has shown that buildings conceived on this plan do not cost more than those carried out in thick stone walls with metallic gables, and that they are solid.

If it is the question of a building with storeys the floor of reinforced concrete takes with advantage the place of the old systems. The most characteristic consequence of the use of reinforced concrete is the suppression of the roof, as the uppermost ceiling can be used as a cover and constitute an inhabitable terrace. This kind of construction lends itself, moreover, to the boldest rakes or overhanging structures.

This system, if applied in a rational manner, is able to bring a change into the architectural forms. It simplifies the forms; it causes the cumbersome complexities of the frames and floorings to disappear; it simply carries out all the surrounding or separating surfaces. It makes disappear every distinction between the wall and the roof. It introduces an architecture consisting of so elastic surrounding walls that these can be given any dimensions required, according to the space it is useful to enclose. The habitations will take the shapes of parallelipeds terminated by terraces, and the large buildings with curved vaults with visible estrades. We must be prepared to see sculptures and moulded relief work disappear and coloured ornaments to prevail. A radical change in the internal and external forms of the buildings will be the consequence of the substitution of a concrete solidary, homogeneous structure for our former architectonic organism. All the forms proper for a combination of marked-out stones and covered over with plaster, which will henceforth no longer be used, would here be devoid of expression and æsthetic value. They must be given up and other methods must be found.

We have in mind three kinds of form: those of "convenience," those of "structure" and those of "expression."

The forms of convenience, by which the building receives its complete usefulness and a character in harmony with its destination, satisfies the mind without causing pleasure to the eye. Those forms of convenience which are, if not the most pleasing, at least the most excellent, can be carried out to perfection by making use of the processes, so eminently practical, of reinforced concrete.

The forms of expression are those by which the architect and his assistants put their imagination and their soul into the building, in order to impart to it the eloquence of a pleasant aspect. The ideal is that they shall form an integral and inseparable part of the structures. In the buildings constructed of reinforced concrete there is little scope for the artist's talent, especially the sculptor's. There remains hardly anything except the superficial decoration by painting and some polychromic, ceramic or other adornments, but for the artists in colour a vast field is opened for their creations.

The forms of structure, either real or fictitious, are the principal ornament of the buildings produced by the old methods. They are those organic forms which give life to the aspect of buildings with walls of marked-out stones.

In the old-fashioned conception a building is to be compared with a living organism where we can distinguish a skeleton, various members and a sort of muscular system. Reinforced concrete does not afford these elements of interest and charm; it leaves the impression that the work has been carried out in too docile a material, on which the sacred labour of the workman and his traditional processes have not left the traces of the noble struggle between the artisan and matter. We do not find the same beauty in this work all cast in one block in a dead and dull-coloured material, without apparatus, without organism, with which the best thing that can be done is to hide them beneath a superficial decoration.

In conclusion, the new processes, economic and powerful as they are, are precious from the point of view of certain bold and complex accomplishments. They are devoid of the charm of an artistic expression. Besides, economy is only a relative law and of a secondary character, and the boldness of the structure is not always required. A process which is prevalent from these two points of view does not impose itself to the exclusion of the others. Recourse may be had to it for the economic satisfaction of utilitarian projects, for the realisation of comfort and for the solution of bold problems. But it will never eliminate from architectural practice the noble and artistic combinations of masonry work in marked-out stones, moulded and sculptured, of frameworks in wood and in metal, of superstructures with vaults, &c.

By JOAQUIN BASSEGODA (Spain).

Building in reinforced concrete does not solve any new problem either in art or construction. It is a composite building of stone and metallic materials by means of which, profiting by the qualities of the two components, difficulties are more economically solved than could be done with either of them alone.

Economy in the use of reinforced concrete does not depend on the low price of the materials of which it is composed, which are comparatively dear, but on their accurate combination, which allows of the quantity being reduced. Economy consequently has a limit in the maximum co-efficient of ironwork and concrete.

There is no reason why these co-efficients, especially that of the concrete, should be higher than in homogeneous constructions, for there are many circumstances, all difficult to foresee, which may produce lower resistances than those which have served as a basis in the calculation; such as the quality of the cement, the nature and size of the sand and gravel, and the manipulation and use of the different materials.

This consideration has produced various systems from which cementwork has been almost completely eliminated, or in which, at all events, it has not been taken into consideration in the calculation. It is then considered as a simple exterior covering destined to protect the metal against agents which would tend to destroy it, such as oxidation and fire.

Security reaches its maximum in these systems, but, on the other hand, economy diminishes. It may happen that this kind of masonry may become less economical than other homogeneous kinds, such, for example, as brick laid with cement.

In countries where they have excellent brick which, according to an already old-established custom, they use in very reduced thicknesses, either in the parts which give support or in the parts which are supported (arches and horizontal floorings), one might introduce the system of fortifying these constructions, thus obtaining a greater economy in homogeneous masonrywork and in fortified concretework.

In places where construction in brick does not meet the conditions required, the use of fortified cement offers a real and effective economy over all other systems of construction; an economy which should not be exaggerated whilst admitting coefficients of work very superior to those which experience found to be absolutely safe. One can recommend such systems in which the ironwork is adjusted to be able to resist all external force.

With regard to the artistic point of view of the question, reinforced concrete has no exclusive form; on the contrary, like every concretion, it takes that which is given to it. The supporting element, covering an empty space, may be straight (beam) or curved (arch): the length of the former is comparatively restricted; the length of the latter can be much extended, as is also the case in homogeneous constructions.

In the straight form, as in the curved, the theoretical limit of reinforced concrete requires, on account of the weight of the concrete itself, the use of a greater volume of iron in the ironwork than is required in homogeneous metallic constructions. The relation or proportion between the units of resistance and of weight is thirteen times greater in cement than in iron. It follows that in proportion as the absolute dimensions of the works in reinforced concrete are increased, so must the importance of the iron over the cement be increased also, and in consequence the forms then have the characteristics of metallic constructions, as may be noticed in the large bridges.

On the other hand, in architectonic works, in which it is scarcely ever desired to attain the maximum of possible dimensions, the artistic character must come from the lines, projections and colouration. With regard to the first the architect can choose freely without any restriction; the second, whatever they may be—mouldings, ornamental decorations, &c.—can also be obtained with ease and comparative economy, but with the drawback that for their execution one must have recourse to moulding, which indicates a limitation of artistic effect to which architectonic art cannot bring itself. With regard to colour one cannot admit the only one, that of cement; but, on the contrary, this modern concrete must be treated as the ancients treated it, that is to say, by covering it either altogether or in part with other materials of which the varied colouration permits the desired effect being obtained, as certain architects and engineers are already doing who have

succeeded in using fortified cement in their works with a particularly artistic effect.

By PETER B. WIGHT (America).

The purpose of this paper is to treat of the actual use of burned clay in building construction according to the present practice in constructing fireproof buildings in the United States.

The American system is not impracticable in any other country on account of cost. Experience, as well as fabrication in large quantities, will reduce cost. High price of labour in the United States should naturally make it more expensive there than elsewhere. Reduction in cost of transportation an important economic item. The whole subject especially pertinent to the present occasion. We are here to learn as well as to teach each other at the same time; to contribute what we know to the fund of information to be here accumulated for the benefit of our brethren throughout the world.

By GASTON TRÉLAT (France).

Steel and reinforced cement are destined to see their use become general. They are fit to be easily and conveniently used together with other materials such as burnt clay and, above all, sandstone; and in this way can be formed a substantial body provided with solidity and of a nature to assure beauty, a quality not to be neglected. Moreover, the walls built by this method are excellent with regard to the health of the inhabitants in consequence of the absence of dust produced by sandstone, and as offering no harbourage to disease germs, against which an incessant war must be waged. The advantages of this particularly healthy kind of installation are, above all, to be appreciated when it is a question of buildings to be used as hospitals or refuges or as cheap lodging-houses. In consequence of the easy disinfection of the walls, the number of dwellings placed one above the other in buildings of great height is considerably more free from inconveniences.

Steel and reinforced concrete are materials with which it is possible to erect very high buildings and at the same time to reduce the thickness of the parts such as walls and floors. Owing to the mechanical nature of these materials they are provided with resistance to compression and to bending which render it possible to gain useful spaces with regard to the total space covered. From the plastic point of view they can form a body with the enamelled sandstone, forming walls which have a pleasing effect to the observing eye. With regard to hygiene the advantages are not inferior to those which may be expected from enamels in consequence of their delicacy of tone. The enamel of the flamed sandstone allows the construction of walls which are impervious to germs. Finally it produces surroundings whose salubrity one cannot too highly extol. Solidity, economy of space, plastic beauty, salubrity, are thus four qualities produced by the use of these materials.

Mr. MAX CLARKE proposed the following resolution:—"That an inquiry in the direction of what failures have taken place in reinforced buildings and their causes would be desirable."

Mr. MILES DAY seconded the motion, which was carried.

Mr. E. O. SACHS submitted a second resolution as follows:—"That where reinforced concrete is intended to be fire-resisting the greatest possible care must be taken as to the nature of the aggregate and its size, and also to the protection of the steel."

The motion was carried.

Among those who joined in the discussion were Messrs. H. Adams, E. Seward, H. K. Bromhead, F. E. Harris, E. W. Fritchley, H. D. Searles-Wood, E. P. Goodrich, A. Augustin Rey, A. W. Ruddle, L. Cloquet, G. Trélat, Ellis Marsland and E. Prioleau Warren.

The chair was taken by Mr. Reginald Blomfield, A.R.A., M. E. Cannizzaro, M. Bartaumieux and Mr. Harbottle Reed acting as secretaries. Mr. Blomfield, in calling on M. Honoré Daumet to read his paper, said that he was the doyen of the Institut de France. Fifty years ago he won the Grand Prix, and since then his career has fulfilled the brilliant promise he then showed. Both as a scholar and an architect he has done most distinguished work. Amongst other achievements he was the joint architect of the Palais de Justice, Paris. For many years he had been engaged on St. Germain, second only to Versailles, which for Englishmen has the additional interest of being the last refuge of the Stuarts.

THE CHÂTEAU OF SAINT-GERMAIN.

By HONORÉ DAUMET, Membre de l'Institut de France.

THE origin of the Château de Saint-Germain-en-Laye, one of the most important that France possesses, is not known for a certainty. The kings of the first two lines probably came to indulge in the pleasure of hunting in the vast forests which covered the hills at the foot of which flows the Seine, but there is no certainty that they had any buildings there. King Robert I., in the beginning of the eleventh century, founded a church on the high land which dominates the village of Pecq. It is only in the twelfth century that there are positive proofs that there existed a royal residence on the spot where stands the present castle. Louis VI., who reigned from 1108 to 1137, is the first sovereign from whom an authentic document makes known to us his presence at St. Germain. His successors made frequent sojourns there: Louis VII., for instance, who resided there in 1143, and held a conference with Henry II., King of England; Philippe Augustus, who made his will there and built the first chapel of the castle. St. Louis received there in 1247 the Latin Emperor of Constantinople, Baldwin II., who made him a present of relics of the Passion. In order to enshrine them the pious monarch gave orders to build the Sainte-Chapelle of the palace in Paris.

The castle of St. Germain was therefore already during the thirteenth century an important royal residence: it was then composed, besides a dungeon, of two blocks of buildings for habitation, placed one in continuation of the other, the foundations of which still exist, and which have been recognised as such by excavations. The chapel of Philippe Augustus being found insufficient, it was replaced in the reign of St. Louis, between 1230 and 1240, by a more sumptuous building, which has remained almost intact until the present time. This is a piece of architecture of remarkable beauty, the merit of which may perhaps be attributed to Pierre de Montreuil, who during the same period built part of the abbey church at St. Denis, certain details of the two monuments being identical.

Inhabited successively by Philippe le Bold, Philippe le Bel and Philippe of Valois, surrounded by a park, the first mention of which is to be found in 1331, the castle was burnt during the English invasion in 1346, but it was not completely destroyed. The chapel fortunately escaped the fire, and steps were soon taken to rebuild from its ruins and to enlarge a residence where the various successive sovereigns were so fond of staying. Charles V. seems to have been particularly fond of the place, and we know that he had important work carried out there: it is to him that we owe the present circumvallation wall which encloses in its perimeter the big dungeon built by Louis VI. and the chapel by St. Louis. This wall, which is fortified in the manner of the period, had the form of an irregular pentagon; it was afterwards used as a sort of sub-basement for the building erected during the reign of Francis I. Inhabited still by Charles VI., the castle was during several years occupied by an English garrison. Subsequently it remained uninhabited during the end of the fifteenth and the beginning of the sixteenth century.

Francis I. gave orders to rebuild it and to follow the surrounding wall of Charles V. The new buildings must have risen quickly, the simplest materials being used for them. The work of the Middle Ages disappeared almost completely, with the exception of the chapel, which was left standing, but which was partly hidden on the side of the apsis by new constructions, whilst the rose window was obscured and crushed by the wall of the *salle des fêtes*, a magnificent hall illustrated in Du Cerceau's precious work, "The Most Excellent Buildings in France," the original drawings of which are now the property of the British Museum. De Cerceau does not give the name of the architect who worked under the orders of Francis I., but it is safe to affirm that he was an innovator, because there exists no other type of architecture similar to the work he produced. To convince oneself of this it is sufficient to look at the very original aspect of the exterior, the beauty of the staircases and of the vaults which have been preserved, the majesty and the vastness of proportions of the *salle des fêtes*, called the *Salle de Mars*, where the great royal assemblies were held,

as well as the festivals rendered so brilliant by the luxury and the elegance which distinguished the Court of the Valois. Henry II., like his father, was fond of St. Germain. Philibert Delorme changed the arrangements of the chapel, and Guillaume Marchant began to build the Château Neuf, whence an admirable view was afforded over the Seine valley. Of the Château Neuf nothing but a pavilion has been preserved, called the Henry II. Pavilion, which contains on the ground floor a curious hall of rustic architecture. In order to put the two buildings into easy communication, a door was made in the southern part of the Vieux Château building, which was surmounted by a very fine piece of sculpture, now placed in the Louvre Museum, and which has been faithfully reproduced above the present entrance. The last Valois did not often stay at St. Germain so far as can be ascertained. Louis XIV. took refuge there during the Fronde, and there passed nearly all his youth. By his orders Jules Hardouin Mansart added to the castle five large pavilions, which completely altered its exterior aspect. The beautiful and original order invented by the master of works of the Renaissance period doubtless impressed the architect of the seventeenth century who imitated him—a very remarkable fact for that time. Balconies in wrought-iron supported by rich consoles were run all round, and the patios' beats of the Middle Ages were converted into terraces. The castle with its wings built in this manner covered double the former area, and the Court of a luxurious king with its numerous retinue was able to be in residence there. Assemblies were held in the château, and it is there that were celebrated especially the feasts on the occasion of the christening of the Grand Dauphin, the exact representation of which is preserved to us in engravings of the period.

Being deserted for Versailles, St. Germain, since 1689, gave refuge to an unfortunate king. The family of the Stuarts received there the hospitality of Louis XIV. James II. died there in 1701 and his wife Marie d'Este in 1718.

From that time onward the Vieux Château only plays an historic part. Its magnificent *salle des fêtes* was sometimes used for theatrical performances. In 1803 there was a project for establishing a hospital with 800 beds there; later on a cavalry school was established in the building; then it became a military barrack and a military penitentiary. It was only in 1862 that the architect Eugène Millet started the work of restoration, which is still going on. The Museum of National Antiquities, which has been installed in the castle of St. Germain, is a guarantee for the preservation of a monument precious on account of the memories it recalls and for the material traces that French art of the best periods has left there in spite of the alterations and mutilations.

Mr. BLONFIELD said they regretted that pressure of time would only allow of each speaker on the subject being allowed five minutes. They must regret that a similar reason had prevented them from hearing M. Daumet at greater length on a subject he knew so well.

Mr. PHENÉ SPIERS, in proposing a vote of thanks in French, regretted the absence of illustrations.

M. CANNIZZARO, who seconded it, said that M. Daumet was an example to all architects as to the proper way of carrying out works of restoration. He lived the life of that period, and thereby was enabled to enter into its spirit. In consequence all the buildings with which he was connected remained buildings of the time of their erection. And that was the only proper way for architects to conduct their restoration.

Mr. E. W. HUDSON expressed a hope that M. Daumet might be persuaded to lend photographs of the sculpture at St. Germain, so as to reveal to England the secrets of the French sculptors' art.

Colonel PRENDERGAST said all must be grateful to the architects who had come so far to attend the Congress. It was fit and proper that the first paper should be read by a Frenchman. Not only were they their friends, but England was deeply indebted to France in her architecture.

Mr. BLONFIELD, at the close, announced that a book was to be brought out by M. Daumet on the château of St. Germain, illustrated with photographs.

The chair for the second subject was taken by Señor H. M. Repullés y Vargas, supported by Mr. John Slater, the secretaries being M. H. Peschl (Austria) and Mr. G. H. Fellowes Prynn (England).

(Continued on page 45.)

NOTES AND COMMENTS.

ALL varnishes are difficult to manufacture, and, it may be said, difficult to test. Unless it dries hard and quickly the surface runs the risk of losing its lustre. But elasticity is also necessary to that end. Results cannot be easily ascertained. Professor BAILEY and Dr. A. P. LAURIE lately brought before the Scottish Society of Arts a new method of testing the hardness and toughness of varnishes. The instrument they invented appeared to a special committee appointed to examine it to be an ingenious attempt to test mechanically the hardness and toughness of varnishes applied to a varnished surface, and was a novel and useful apparatus. The interesting fact ascertained was that when a point was weighted to 1,200 grammes and did not injure the surface varnished, the quality might be regarded as a fair standard of hardness. It had, however, to be ascertained by observation whether hardness alone could be relied upon as a test of the true value of the varnish, for eventually the test of time might demonstrate it to be brittle and inelastic owing to deterioration. The committee considered the researches and the apparatus so desirable that they recommended the invention to the favourable consideration of the prize committee.

A PARTY of members of the Society of Antiquaries visited the remains of the Roman villa at Bignor, in Sussex. The pavement, which is one of the finest in Europe, is on the farm of Mr. RICHARD RUPPER. It was in the time of his grandfather in 1811 that a part of the pavement was discovered. The work of excavation was undertaken by SAMUEL LYSONS, the archæologist. A marvellous drawing by him, showing all the details, hangs in Mr. RUPPER's parlour. Care was taken to cover the principal pavement by a roof, and it suggests the watchfulness of the owners that so little disturbance has taken place. Occasionally some of the tesserae were lifted by underground vegetation. Last autumn the Society of Antiquaries had the mosaics cleaned and the loose tesserae fixed in their places by Italian workmen. The restoration was conducted under the supervision of Mr. W. H. ST. JOHN HOPE, M.A., secretary of the Society, and Mr. R. GARRAWAY RICE, F.S.A., the latter being a resident in the neighbourhood. The object of the visit on Friday was to examine the work, and it was considered satisfactory by all who were competent to judge. Bignor is within a few miles of the railway stations of Pulborough, Littleworth and Arundel.

THE Russian Government has been supposed to be desirous to compel the Finns to abandon all their racial pride. Even the friends of Russia would be opposed to that policy, for the people are among the most interesting in Europe. In our time, when the alliances between languages receive attention, Finnish speech is as interesting as Celtic. The Russian Government must have listened to wise counsel when it agreed to the erection of a national museum in Helsingfors. That city has not only several fine buildings, but the university has also a valuable ethnological collection. Scattered through the city are several small collections which it is proposed to bring together in the new building, of which the foundation-stone will shortly be laid. The museum is expected to cost about 800,000*l.*, and will represent history and ethnography as well as archæology. The Finns have believed that learning and liberty were closely connected, and although it may seem to be rather late to collect relics of the people, their enthusiasm may be able to accomplish much. Helsingfors only dates from the sixteenth century, but it would be difficult to say when the Finns first appeared in Europe.

It is commonly supposed that public markets are a great convenience, as goods are obtainable in them

at a less price than in ordinary shops. As the stallholders have to pay rent, and as dealers are governed by the prices paid in shops, it is not clear where economy can be secured. If by-laws existed which fixed prices at a definite percentage below shop prices then the advantage of markets would be plain. If the stalls are let at too moderate a rate then the public market is costly, and the expense of upkeep must be borne by the ratepayers. This has just been exemplified in Southport. On the recommendation of the markets committee, it has been decided to convert the front of the market hall into shops. In adopting this course they have been guided by the example of Bolton, where 20,000*l.* has had to be expended in building shops on two of the sides of the market hall. It is needless to say the Town Council ascribed the loss to the architect who designed the structure. It was said that the belief was that an imitation of Newgate Prison would look well in Southport, and a similar mistake was made in Bolton. It is impossible to go against economical laws in markets as in other ventures, and considering the difference of English trading, it may be taken for granted that markets are a delusion which arises from absence of knowledge.

ILLUSTRATIONS.

ELEVATION OF PROPOSED CHAMBER OF COMMERCE, LONDON.

IN the year 1891 my late father, Mr. FREDERICK SANG, architect and artist, submitted designs to the London Chamber of Commerce for an Imperial Chamber of Commerce in the heart of the City of London. Four years later he laid the following scheme before Mr. BALFOUR, the Premier, and Mr. JOSEPH CHAMBERLAIN, the Colonial Secretary. The scheme was this, viz. to establish a commercial parliament in the heart of London, the chief city of the British Empire, on similar lines as at present exists in the German Empire (Zollverein). The proposed building to contain a grand parliamentary chamber for meetings of the commercial members and representatives of England and her colonies, where they could consult and discuss matters regarding the commerce of the Empire. All the colonies to have their representatives in the building, as well as a museum, library and show-rooms, where specimens of raw materials and manufactures of our vast colonial possessions could be exhibited and inspected by our merchants to see at a glance what our colonies could supply us with and also their requirements, as well as our commercial dealings with foreign countries. Our consuls all over the world to supply the Imperial Chamber of Commerce in London with commercial particulars of the requirements and productions of the countries they are accredited to. The Imperial Institute in Kensington is too far west for the merchants of London to refer to, and does not sufficiently give the necessary information required. The design represents the side elevation with principal entrance near London Bridge (King William Street) facing the Fishmongers' Company's hall. The principal elevation, over 400 feet long, facing the river Thames, to be built on a quay similar to the present Custom House. The ground floor of this building to be used as offices, &c. for the commercial navy of the British Empire, telephone, telegraph and post offices, &c. As I said before, all the existing chambers of commerce to be represented under one roof in the heart of the greatest commercial city of the empire, which thus would be concentrated and in direct touch with the whole world. HENRY H. B. SANG.

ARCHITECTURE AND SALARIED OFFICIALS.

By OTTO WAGNER (Austria).

THE fact, which it is impossible to dispute, that the first architects in the world in a great many cases are not agreed on the question as to what constitutes an architect, gives the certain proof that the title of architect cannot be protected by letters patent, and that a judgment of artistic qualities is possible only by the artists themselves, consequently by the grouping of the artists among themselves.

In the latter circumstance we find also the proof that municipal and State administrations are not even in a position to make the proper choice of an artist to fill an office.

Still another important factor comes into consideration for making such a choice. The architect appointed to an office will, while occupying it, certainly not play the leading part. His individuality, his taste, &c., must therefore subordinate themselves to the same qualities in his superior, or even of more than one superior. The works carried out under the supervision of the office would therefore not show the capacities, the taste and individuality of the creating artist, but certainly the less valuable ones of his superiors, and as such superiors in most cases are laymen in questions of art, and often even in technical matters, it will be hardly necessary to give any more reasons why from such a combination no good can come.

It must also be mentioned that the artistic gifts of an artist oppressed by the yoke of office can never undergo the absolutely necessary development. These considerations prove sufficiently that a municipal or a State administration is never in a position to obtain the services of first-class artists as salaried officials.

But municipal and State administrations have certainly the sacred duty of cultivating the fine arts, which means with regard to architecture that the buildings erected by them should exercise the effect of models. Buildings of such a description can only be expected from great artists, and not from officials of an inferior artistic capacity.

For the same reasons the competence of the officials must only extend to the practical, technical and economical, but never to the artistic control of buildings in the course of construction. If, finally, it is taken into consideration that, by the awakening which took place in the region of art, a lively controversy raged everywhere, and that even to this day public opinion has hardly returned to calmness, and therefore is not in a position to judge with unbiassed artistic feeling works of art, such a large number of reasons has been put forward that the correct answer to Question I. becomes easy. It can only be this:—

Important municipal and Government buildings can only be constructed by eminent artists, and not by salaried officials.

By OSCAR SIMON (Belgium).

The Central Society of Architecture of Belgium is of opinion that no advantage can result from the execution of public buildings by salaried officials (surveyors, &c.), neither for the administration, which protects its agent and takes upon itself the civil responsibility, nor for the public, which pays and suffers from the imperfect arrangements of the buildings destined for its use, and the æsthetic feelings of which are too frequently hurt and painfully impressed by the permanent sight of buildings generally devoid of artistic character.

We hold that it is an abuse that certain officials (surveyors) should offer to private parties on the look-out for authorisation by administrations services which are prohibited by the regulations, and which are a form of unlawful competition highly prejudicial to the independent architects existing only on the income from their professional art.

It is desirable that more energetic action should be taken by architects, with a view to obtain legislative powers:—

1. By bringing into harmony with the modern requirements of life the rate of the out-of-date tariffs still enforced upon the architects.

(A juridic consecration should be given to this principle: "To a superior talent higher fees should be allowed.")

2. By putting a stop to persons invading the architectural domain who do not exclusively exercise the profession of an architect.

3. By the revising of the laws on building in those passages where the text, or the interpretation given to it, imposes on the architect obligations and responsibilities

inconsistent with his mission as an artist and out of proportion to the fees which are allowed for them.

(Apply juridically to the architect and to the contractor the common law principle, "To a larger profit must correspond a more extended responsibility.")

4. The Central Society of Architecture of Belgium is of opinion that if it be essential that the execution of public buildings should be entrusted to private architects it is ardently to be desired that all the work, whatever its importance may be, of construction and arrangement of plan of buildings for the public use should be exclusively given to practitioners of the architectural art.

Moved by a feeling of professional solidarity the seventh International Congress of Architects, meeting in London in 1906, wishing to affirm with all its power the claims and just aspirations of the architects, with a view to an improvement of the economic conditions of their existence, formulates the resolution:—

"That in the future the administrations of States, departments or provinces, municipalities or communes, as well as the administrations of benevolent institutions which may be founded by the former, shall give instructions for professional architects to be appointed by way of public or limited competitions, or whose special capacities or notoriety shall be universally recognised, for the projects of works or buildings to be carried out within their jurisdiction;

"That an absolute prohibition shall put an end to the interference of agents paid by the public administrations, that they shall obtain through private persons an authorisation which can only be granted by public authorities;

"That within the limits of their influence in the legislative assemblies our representatives shall take the initiative to bring about the reform of the laws in force in such cases where the obligations and responsibilities imposed on the architect are incompatible with his mission as an artist and in disproportion to the emoluments attached thereto."

By GASTON TRÉLAT (France).

The buildings we may have to erect or to rearrange answer the requirements of the moment or of the future. What is required is knowledge and experience. Teaching is not sufficient to develop the necessary capacity. Something more is demanded than a cramming of characteristic facts acquired by instruction. The latter must be completed by a personal training in the profession. It is to be recommended that the latter be not started too late, and that the simultaneity of the two operations be secured. The intellectual and the technical education combined generally carries with it a considerable widening of ideas. It may be infinite; not seldom even it lasts as long as life itself. There exists something like a stimulus to acquire new knowledge, the want of which is accentuated in intensity by the existence of personal ideas. But, above all, it is the true source of the original points of view as opposed to the knowledge acquired by study.

In the exercises offered by the workshop, the laboratory, or by that other vast workshop which is the nation, education is ever active and imparts a particular course to the mind. Then it is that the capacity for hypothesis and for the ideal asserts itself in matters of science and in matters of art. The fact remains that art and science are in our days considerably nearer each other than they were in the past. They are two leading branches of human activity, each having no longer any right to remain indifferent towards the other.

The question of public buildings gives rise to a great many questions which interest our societies. This is one of the general features of the mission inherent to the architect. He must therefore keep in touch with the time and constantly interrogate it about the requirements it may manifest to him. Science and art enable a selection to be made of remarkable solutions. The consequence is a knowledge and experience which the different modes signalled will call forth. It is useful to propagate their habit.

Mr. G. OAKLEY TOTTEN (U.S.A.) in opening the discussion said that the subject of "The Execution of Important Government and Municipal Architectural Work by Salaried Officials" was one of the few subjects before the Congress in which it would be possible to see material effect. He had informally brought it before the last Congress at Brussels, where it was warmly taken up.

Professor V. NAGY (Hungary) followed.

Mr. F. E. P. EDWARDS (Bradford) complained that the title of the subject was a little misleading, for it suggested a strong doubt whether any good work could ever come out

of the office of a salaried official. He presumed it was really intended to be a protest against architectural work being confided to engineers, road surveyors, &c., who lacked architectural training. He himself admitted to being a salaried official, but he nevertheless hoped he was an architect. A great number of instances might be quoted where most excellent work had been achieved by official architects. He considered that the matter should be put on a clearer basis. The root of the matter, in his opinion, lay in the fear among architects that they were losing their bread-and-butter. There was a growing custom for large business concerns to employ at a fixed salary someone to do their architectural work. This evil was the outcome of the large number of young men who took up architecture as a livelihood, and who after their days of pupilage were glad to seize any assured means of supporting themselves. These would willingly accept an offer to devote themselves to a firm at a fixed salary.

Mr. A. W. WEISSMAN (Holland) said he had once been an official architect, though now he was in private practice. He thought the crux of the question was whether the official architect was competent or incompetent. The fact of a man being an official did not make him a bad architect, nor did the reverse hold good, though if a choice was to be made between a good official architect and a good non-official one for carrying out the work, he believed the preference should be given to the latter. His experience was that work emanating from the offices of a public official architect on the Continent was only in very rare instances to be attributed to his hand. The real authors were his clerks and assistants.

Mr. A. W. PLUMMER said that the question was of even more vital importance to practitioners in the provinces than to those of London. An official architect had no one to criticise his work, and he practically passed his own plans. The public were naturally inclined to go and explain their requirements to a man who was peculiarly able to gratify them. He hoped it would be made illegal for salaried officials to take up private work in unfair competition with other men. It was not necessarily cheaper for a public body to have a permanent official architect, because he and his staff were being paid whether the work was plentiful or slack. It was desirable that the matter should be thrashed out.

Mr. G. H. FELLOWES PRYNNE said that in England architects greatly suffered through officialdom. It was undeniable that a large amount of good work was done by official architects. Yet it must be remembered that in large towns the share of the head of the department in much of the executed work must be small. It was a dangerous prerogative for an official doing private work to pass judgment on the plans submitted by private practitioners. He hoped that any decision arrived at by the Congress would not remain as a mere passing of a resolution, but that it would be brought to the notice of the various Governments.

Mr. MAURICE B. ADAMS said that, however estimable official engineers and road surveyors might be in their own departments, another feeling was introduced when they took up architectural work. It was another matter when the architect was fully qualified. If the employment of a salaried architect was proved to be cheaper it was useless to kick against the practice. However, in some cases it must necessarily be anything but economical. When an official took up special work without any special training the result must be a loss of money. If a staff was formed and there was no employment for them work would often be made. If assistants engaged for a special job, they were kept on until the quantity surveyors had done the measuring up. The matter was bound up with municipal trading.

Mr. J. SLATER reminded his hearers that the subject had received in the past long and anxious consideration from the Institute, who had sent a resolution thereon to the public bodies of the country. It was the principle they were fighting for. Undoubtedly some official architects were men of capacity, and with ability to carry out praiseworthy work. But under normal circumstances such a man could not have the time at his disposal for properly executing large undertakings. Any decision they came to in the matter ought to have weight throughout the world.

Herr BODO EMBIARDT (Germany) stated that the question had long been one of the most absorbing under the consideration of German architects. It was at first intended that no official architect should be admitted as a member of any architectural society. But after several years it was found to be impossible to hold that those officials were

lacking in genius. Nevertheless, the German architectural societies meant to agitate, in the hope that all great public work should be open to public and private architects.

Mr. W. E. RILEY claimed that qualified officials should not be excluded from carrying out big schemes.

It was then proposed that owing to the extent of the subject, and the comparative smallness of the members present, compared with the number of architects affected, that resolutions should be formulated and discussed by a special committee. Another proposal was that the discussion should be adjourned. Both were negatived, and the following resolution was passed:—"That in future in the interests of the administrations and of the public, and in the highest interests of the art of architecture, public administrations, whether Governmental, provincial or municipal, should entrust important works of architecture only to professional qualified architects, either by competition or by other means."

Wednesday, July 18.

On Wednesday the chair was taken by Herr Otto Wagner (Vienna) and Mr. R. S. Balfour, with M. G. Wickman (Sweden) and Mr. H. O. Tarbolton (Scotland) secretaries. Herr Otto Wagner, in opening the proceedings, thanked the audience in his own name and on behalf of all Austrian architects in conferring on him the honour of acting as chairman. His ignorance of English and slight acquaintance with French prevented him from fulfilling his duties properly. His English colleagues had, however, organised the Congress so admirably that nothing was left to be done. The Austrian architects meant to take this organisation as their model if his distinguished colleagues would accept the invitation he was deputed to give at the final meeting, viz. that they should make Vienna the meeting-place of the eighth congress.

THE ARCHITECT-CRAFTSMAN.

By REGINALD BLOMFIELD, A.R.A.

THE idea of the architect-craftsman suffers from uncertainty as to the extent in which craftsmanship is necessary to the architect and to what extent a training therein should form part of his education. In the early days of Italian Renaissance he was almost invariably a craftsman, or rather as an artist he practised architecture. In the middle of the sixteenth century he detached himself and specialised in architecture. The result was that inferior men usurped the decorative art. Inigo Jones was the only English architect of the seventeenth century who went outside architecture. By the end of the seventeenth century architects had ceased to care for anything beyond their buildings, and they were able to dispense with much of the detail drawing now essential. The loss in certain directions was counterbalanced by increased skill in design. The best work of Wren is more mature than that of Inigo Jones. At the end of the eighteenth century architects again resumed multifarious designs, and for the first time architecture became a literary fashion. But it died and opened the way for the fads and revivals of the nineteenth century.

In England architecture went plunging down the slopes of Mediævalism, with A. W. Pugin at the head. The Old Guard, like Burton, Barry and Cockerell, made a stand in the fight against sentimentalism. Except for them, we should to-day be floundering in a quagmire. English art sank to its lowest depths in 1851. This was the turning-point. The pre-Raphaelite brotherhood appeared, and influenced ideas on architecture and craftsmanship. This movement was seized on by literary men, and its inspiration became literary, anything rather than artistic. Mr. Hunt declared that he and Rossetti agreed that architecture came within the proper work of a painter who, learning the principles of construction from nature herself, would apply them by shaping and decorating the material he had to deal with. Ruskin urged that architects should learn their art not in cities, but in the hills, and study what nature understands by a buttress and a dome. Such views could not lead to greater knowledge or skill in architecture, and art ceased to be regarded except as a material for copy. Morris had tried architecture and given it up in disgust. To him it was a great assemblage of the arts in which architecture was merely a vehicle for carving, tapestry, &c. He never approached it from the standpoint of the architect, but rather as a socialist and craftsman. Gothic was the art of the future because it admitted the guilds. Morris had his eyes so firmly fixed on detail he never rose to the concep-

tion of the art of architecture, which is concerned with the rhythm of building, with thought in great spaces—an art in which detail reinforces a dominant idea. The pre-Raphaelite brotherhood dwindled down to a championship of the handicrafts. But Morris did invaluable work. He taught people to value good workmanship, material, colour, to dislike empty-headed art and to aim high. The Arts and Crafts Society produced the effect that the proportion between architecture and the crafts was lost. It cannot be too often insisted that architecture is not mere decoration or ornamental building, but it is something outside and beyond the various crafts.

Hence the architect is not a craftsman in the sense that are cabinet-makers, and must have a different training. We are taught architecture is a science and also an art, but it is not a science like botany or chemistry. The real science of architecture is that knowledge of the effect to be aimed at and of the means of realising it. It is only by prolonged and intimate study of buildings that a mastery can be obtained. Architecture must satisfy utilitarian and æsthetic requirements. It inspires a sense of organic thought moving in orderly sequence through particulars to the total effect. A fine architectural composition may be compared to a concerto of Bach. Both show restraint, the selection and interweaving of motives, the definite and consecutive construction in which each detail falls into place. However much architecture may be enhanced by sculpture and painting, it is yet independent of them in producing its peculiar impact on the sense. The Pantheon would if shorn of all its ornament remain impressive.

This aspect has dropped out of view. Much of modern English decorative art is done with laudable zeal but inadequate technique, and resulted in "art nouveau." The architect must reassert himself, and take his stand on the true function of his art. Architecture presupposes in its exercise full knowledge of the resource of the art in detail. An architect must be acquainted with his materials and with the laws that govern their behaviour; he must know what he can fairly get out of them. The earnest student must ever keep his ultimate goal in view. The range of architecture is too great to be taught in a given number of years. Great architects usually reach the maturity of their powers in early middle age. All that can be done for students is to lay a good foundation, to familiarise them with their tools and materials, and to give them an insight into the means available for architectural expression. In doing so it is essential to keep before the student the ultimate end of all his training, viz. skill not in draughtsmanship or craftsmanship, but in architecture.

William Morris and the Arts and Crafts Society have tended to substitute architecture for craftsmanship. The former is at present under a cloud. Nevertheless admirable work has been done by English architects of to-day, like Mr. Norman Shaw. There are signs of improvement here and there, but it is impossible to feel certain that the art is back on the lines of true development. If architecture is to hold up its head again in this country it will be through unwearied efforts of architects to realise, and make others realise, that there is such a thing as the art of architecture, and it is worth devotion on its merits.

By W. R. LETHABY.

The practice of modern architectural design is based on custom. In some countries there seems to be a more general agreement than in others, and in the former there is a nearer approach to the existence of style. Beyond this, what are the possibilities by which modern architecture may enter on a course of development, and how can we attain to reality in building?

The styles of the past were shaped by a growing mastery of craftsmanship, and only this will produce art akin to the old, an art which is discovered rather than willed. The architect's store of forms is for the most part degraded memories of the discoveries made by ancient craftsmen. Whence is new energy in modern architecture to be derived? In part it may come from the investigations of science; but even so it will require a resourceful craftsmanship to deal with the new material.

At present the architectural profession is isolated from workmanship, and is thus imprisoned within a small sphere of ideas. Architects have aimed at bringing back the appearance of masterly craftsmanship, but this outward appearance has no vitalising force.

A closer contact with labour may mean at least three things. We need, first, to be in closer touch with the executants of our buildings, and to be anxious to learn from

them what they think is good work. In the second place, it may mean the acceptance by the scientifically trained directing architect of more help from independent workmen of a high order, painters, sculptors, metal-workers, modellers, and the like, while giving up the commonplaces of office-designed ornament. And, thirdly, it may mean the practical training of architects themselves. This idea is liable to two misconceptions; as if it were proposed that the architect engaged on important work should make his own mortar, or as if the claim might be satisfied by receiving lessons in enamelling or wood-carving. The crafts essential to an architect, of course, are masonry and carpentry, while they remain the principal factors in construction, and, so understood, craftsmanship should form the basis of architectural education. The student should cut stone, frame up wood and handle bricks. Often, of course, he could not afford much time for this, but even a month's practice with materials and tools would be better than nothing.

A short course should form a part of the education of all students, but some would probably become much more interested in this side of things, and could follow it out further. Thus we might train architects of varying capacities for various requirements. It is the mistake of all systems to form men of one pattern. However desirable it may be to train some men to the highest degree of academical skill, these are best fitted to deal with the complicated problems of practice in a big city, while the humbler works of the country require equal devotion, but of a different kind. A basis of craftsmanship in architectural education should open out channels for diversities of gifts which may correspond with the diversities of requirement.

By FR. VAN GOBBELSCHROY (Belgium).

The importance of the mandate of the architect is great, because it expects from him extensive knowledge, without which the artist cannot consider himself to be at the height of his mission.

The great drawback the profession suffers from is due to the fact that the title of architect may be assumed by persons who have neither obtained a diploma nor received a special education, and that this unjustifiable tolerance places in the hands of inexperienced persons an art which they will never be able to understand, and still less to practise.

The architect must be able to judge, as a real expert, of the most minute details of the construction—in a word, he should possess the technical knowledge of all the trades which he employs, and this to the extent of being in a position to discover and to have put right without hesitation any part of the work badly done. And in the presence of this vast knowledge, which one should expect him to possess, there is no doubt that the architect would recover the prestige he always used to exercise in the building industry.

Besides, it must be stated that this perfect knowledge of the technical part of the crafts which we ask the architect to possess is not an innovation. In fact, many architects of the Middle Ages and men of science, such as Galileo, Newton, Leibnitz, Stephenson and others were, at the same time, manual labourers. They knew how to manipulate matter in order to put their ideas into practice.

Of course it is not necessary that the technical knowledge of the architect should enable him to perfectly handle the tools of all the crafts—this would be useless; but it is necessary that his knowledge should enable him to carry out everything in accordance with the rules of art; and for this purpose it is necessary that he should himself, within the limits of possibility, have practised under the eye of an experienced master all the kinds of work which later on he will have to carry out in his projects.

This education, which would form part of the whole, would not require more than two years of supplementary studies, because it would only be a question to extend in a practical and convenient way a known programme.

The present programme followed for the studies of the architect could remain, with a certain revising, and there would have to be added to it that which is wanting for the training of the artisan.

By OTTO WAGNER (Austria).

Concerning this question we beg to make the following observations:—

Reference has repeatedly been made to the scientific education of the architect, and stress has been laid on the fact that he has to learn such a vast amount of facts, and that, for the reasons given in the beginning, this learning

cannot embrace everything. In going through the technical studies of the architect, what is required is a good grounding, which will enable him to acquire what is further needed in the course of his subsequent period of activity.

The actual work of the architect and a number of artistic matters, such as the cultivation of the allied arts of painting and sculpture, the keeping pace with the professional literature, &c., cannot fail to induce him to be very economic with the time he is able to give to these occupations, and moreover, he will have to reserve a very considerable part of his time to the supervision of the works to be carried out by him. It will therefore not be wrong to affirm that these matters can hardly receive much attention, from sheer lack of time. To this must be added the loss of time which is caused by the fact that the desire to create, and consequently the capacity to create, are faculties which the artist cannot command at all times.

A further accumulation of work by learning one or more trades (to learn them all is utterly out of the question) certainly exceeds that measure of time which the architect has at his disposal to devote to such work. If besides it is taken into consideration that handicraft of the kind in question sometimes requires considerable physical strength, and may therefore be injurious to the steadiness and the fine touch of the hand, it is dangerous to penetrate so far into the manual work of the architect's craftsmen. The knowledge how any given part of a building is to be made belongs to the sphere of practice, which the architect will acquire in the course of his career all the more readily because his innate gift of invention will serve him as an auxiliary.

The question under consideration can therefore be correctly answered in the sense that the architect must know in a theoretical relation, and with regard to intuition, every trade and the qualities of the materials which he uses in his constructions, but that it is not necessary that he should become proficient in the manual skill belonging to the handicraft.

By GASTON TRÉLAT (France).

The theoretical and practical education of artisans can certainly become an abundant source of development in art. But then it must be judiciously led. Otherwise it would have dangers which would soon show themselves in the work produced.

I wish to say at once that it ought to be consistent with the direction which the professional life takes. And this latter entails the general affinity with all the trades which contribute to the execution of the architect's works. From this results a real theoretical and practical education, which latter embodies itself in an extension of conscientiousness in the artist. Hence a vivacity of spirit which shows itself in the particular character of the elements conducing to the harmony of the *ensemble*, to which they remain subordinate, without which would be exceeded the taste and proportion taught us by a certain philosophy drawn from manners of arrangement to which matter is subject. As can be seen, it is an education to which one consecrates one's life.

But for that there would be no reason to rely on an initiation from the commencement of life. Before all else, it must endeavour to show the disadvantages of making the different elements that the variety of trades represent dominate too much in a work. For this would expose one to a cause of incongruities which should be avoided in architectural conception and execution. Certain masters, whose memory is surrounded with the respect which is due to them for the harmony of their lives, and certain schools could supply evidence of this, if the thing needed to be supported by material proofs. But this is not the case.

Therefore, in order to prevent confusion in the mind, this education will be carried on by the fact of the career itself. For the architect it will result exclusively from the experience he will gain from all the trades contributing to the execution of his buildings.

The education of an architect-artisan is sufficiently gained by the routine of a life practically absorbed in the applications of the art.

With regard to a theoretical and practical education at the commencement of the career, the advantages would in no way make up for the time spent, and the disadvantages of it would predominate.

By ROBERT LESAGE (France).

Should technical teaching be given at the school of architecture and at the fine art school, or should it be given in a school absolutely independent of these?

It is impossible to answer this question in a general manner. The organisation of a technical school for the crafts of the building trade, complementary to the schools of architecture, will of necessity work in unison with them.

To each special case will correspond a special and adequate solution.

The same answer must be made to the question, Is the technical teaching to precede, to accompany, or to follow the teaching of the art of architecture?

We beg to propose the following resolution:—

This Congress, considering that the architect, the master of the works, having under his immediate direction workmen and artisans of the most varied bodies of the State, and utilising the services of the most varied industries, has no means of acquiring in each of these trades and in each of these industries the complete knowledge of a specialist; considering that there exist already in the majority of European countries training schools for artisans, schools for practical application and laboratories for engineers where specialists are trained, expresses the desire that there should be created specially for the architects and for the general contractors schools in which, in the limited space of two years, they could acquire in a general but exact manner the technical part of the various trades and industries of the building trade, without claiming to practise these trades and industries. It also expresses the wish that between these schools international and continuous relations may be established.

A general discussion followed, in which the following took part:—Professor V. Nagy (Hungary), Mr. Maurice B. Adams, Mynheer J. T. Cuypers (Holland), Mr. H. P. Maule, Mr. E. P. Howard and Mr. C. H. Walker (United States).

The following resolution was then carried:—"This Congress, considering that the architect, the master of works, having under his immediate direction workmen and artisans of the most varied bodies of the State, and utilising the services of the most varied industries, has no means of acquiring in each of those industries the complete knowledge of a specialist, expresses the desire the opportunity should be given to architectural students to acquire in a general but exact manner the technical part of the various trades and industries of the building trade without claiming to practise the trades and industries. It also expresses the wish that between these schools international and continuous relations may be established."

A section of the Congress, Herr H. Muthesius presiding, met at the Royal Institute of British Architects on Wednesday morning, and debated upon the reports forwarded by several foreign societies.

INTERNATIONAL COMPETITIONS.

By J. GUADET (France).

THE regulations must allow the same time to all competitors. Programmes must be given out simultaneously in every country. The programme should be issued everywhere in the language in which it is drawn up, and not in translation. Every further communication should be addressed to all the competitors. During the competition no change should be made in the regulations governing it. The same date for sending in designs should be obligatory everywhere, and designs should be sent in to a place specified for each country. The premiated designs should become the property of the promoters, but without prejudice to the laws of artistic copyright. An exhibition of designs before and after adjudication is necessary. The regulations must indicate whether the designs should be signed or distinguished by a motto; signature is best, but the adoption of a pseudonym should be allowed. No envelope containing an author's name should be opened without his consent, except in the case of premiated designs. The technical programme should be clear, precise and drawn up under the advice of experienced architects. It should avoid directions which cannot be followed, and should not impose excessive work by means of drawings that are useless or too large a scale. The competitors' personal expenses should be reduced to a minimum.

The jury should be formed of architects of each nation represented in the competition in the proportion of one assessor to ten competitors or fraction of ten afterwards. Every nation represented by less than ten competitors, with a minimum of five, should have the right to one assessor.

Special conditions for competitions in two stages.

THE SOCIETY "ARCHITECTURA ET AMICITIA"
(Amsterdam) proposed:—

The conditions of the competition must be the same for all competitors. Exceptional conditions, no matter under what form, are prohibited. The delivery of the designs must be made anonymously.

The date of the sending off, proved by the stamp of the stations of departure, which must be delivered to the jury, shall be taken as the final term for the closure of the competition. The programme of the competition shall be published or placed at the disposal of the applicants in all the countries, or groups of countries, at the same date.

The jury of an international competition will in principle be formed by half the number, less one, of the members of the nationality of the country in which the competition is opened. Architects must form the majority of the members of the jury. The names of the members of the jury and of their substitutes, with the declaration which contains the approval of all the conditions, shall be inserted in the programme.

The jury of the country in which the competition is held forms the information bureau. The publication of announcements relative to the competition will be made in such a manner that it may be considered to have come to the knowledge of all interested parties. These announcements shall have the same value as the conditions of the programme.

The programme must express in precise terms the conditions made, making a distinction between the absolute requirements and the optional requirements. It would, however, be preferable that optional conditions should not figure in the programme of the competition.

The number of drawings to be sent is to be limited to the quantity absolutely necessary, in order to avoid all useless work and superfluous expense.

The total amount of the prizes to be distributed shall be at least equal to double the amount which would be paid for the architectural part of the work carried out to an architect who had been entrusted with the execution of the design.

By GASTON TRÉLAT (Paris).

The argumentation of the previous subject bore, in the first place, on the spirit which in general dominates architects. Contrary to the intentions of a generous application of art, the architect often seems too pre-occupied about not doing certain things. And one spends a good deal of time in learning those things which must be avoided. Wasted years, it seems: how much more preferable would be an education which faced the realisations to be deduced from contemporary science? This would adjust itself to the standard authorised by experience.

Competitions, as they are now held, have not the scope they ought to have. Conventions take up too much place, one has a sense of things learnt: book learning of a kind and without influence on the mind of the masses.

Public beauty, like public health, corresponds to the contemporary movement of democracy, of which these two capitals are a momentary crowning. The architect has no right to separate himself from it if he wishes to fulfil the function expected from the social competence it is his duty to show.

Internationalism and publicity will give to competitions a youthfulness and a vitality which they have not had up to now, and which are a part of the movement of contemporary effort.

These competitions should have exclusively in view the services of which they are the object. It must be so, in order to insure to the operation a normal rectitude which would keep it above the paltrinesses which are too well known and are lowering to art, causes lowering alike for competitors and judges, and injurious to the solutions to be gathered.

The competitions being international, the nations taking part in them through their artists will all include the same number of judges.

In this way the competition agents, whom the judges represent, will doubtless be less inclined to look upon themselves as a delegation having to represent the interests of compatriots or the idea in fashion currently admitted in their country. The jury will be more particularly engaged in selecting and bringing about a solution, while the competitors themselves, in consequence of the absence of preconceived ideas represented with a show of authority, will strive to elaborate and present different sides, to the exclusion of all party spirit. And, in these days, if one

wishes to respect personalities alike useful in art and in science, it is impossible to be sufficiently on one's guard against these fatal influences. In effect, whatever may be the interest of contemporary evolution, with its abundance of curious observations and generous comparisons in their knowledge, ill-luck will have it that, in revenge, we must endure the narrow ideas of little groups and clans, which bring confusion into the service of the human collectivity. It is, however, to this that all our efforts should directly refer, free from this impediment, very regrettable socially.

To bring this *résumé* to an end, with regard to competitions I must again say that the spirit of augmentation followed in these lines endeavours to insure the supremacy of the decision, uniting the choice of the work and the choice of the artist charged with its execution. The author of the first idea ought to complete the studies and accomplish its realisation. And the same spirit which the decision has intended to make clear will be found in the accomplished work. This is how things should go, if one would keep to the rectitude that the situation demands and respect the responsibility that the decision imposes on the jury.

And the organisation, as sketched here in its characteristic features, would perhaps be destined to give results still unforeseen. But this would be on condition of always keeping in the path that would normally be deduced therefrom, once agreement was come to on the ideas which support the solution I submit to the Congress.

Conclusion.—Without consciousness there is neither art nor artist. It is only by a wide comprehension of things, all leading to the consciousness of his time and of humanity, that the artist can do a useful work. In these days the widening of science serves as a basis to this consciousness. And the applications of the art take a special character in order to supply the needs and aspirations of the period.

The organisation of international competitions showing a greater amplitude of intellectual horizon would be in accordance with the ideal of the day.

Again, these competitions would have the advantage of extending the character of educations which up to now have remained restricted to present requirements.

But measures would have to be taken to insure the entire liberty of intellectual expansion amongst the artists entering into competition, to afford the jury an unlimited independence and to enlighten the consciousness of the verdict they would give.

After discussion of the reports the following resolution, proposed by Mons. G. Harmand (France) and seconded by Mr. Walter Reid (Transvaal), was adopted:—"This Congress, taking into consideration the Reports submitted to the Congress, recommend them to the attention of the permanent committee of the Congress in order to submit a special Report to the next Congress."

The questions on copyright and ownership of drawings were discussed before a large representative meeting on Wednesday morning at the Royal Institute of British Architects. The chairmen were Mons. H. P. Nenot (France) and Mr. W. S. Eames (America). Mons. J. Urioste y Velada (Spain) and Mr. Walter Reid (Transvaal) acted as hon. secretaries.

OWNERSHIP OF DRAWINGS.

By H. HEATHCOTE STATHAM.

THE question of ownership of drawings is distinct from that of architectural copyright in designs, with which it must not be confounded. It turns on the question whether the drawings and specifications made by the architect in order to carry out a building are to be retained in his custody or to be handed over to his client. In France and Germany no legal question is raised on the subject; the architect retains the drawings as a matter of law. In England the custom has been almost universal in the same sense. But in the case of *Ebby v. M'Gowan* (1870) the Court ruled that, the building not having been carried out, the drawings must be handed over to the client on his paying for the time expended on them. In the case of *Gibbon v. Pease* (1904) the Court, to the surprise of architects, ruled that the precedent of *Ebby v. M'Gowan* covered all cases, whether the building had been carried out or not, and that the client had a right to demand all the drawings, the Court refusing to hear any evidence on the side of the architect, whose drawings and specification can therefore, in England, be legally claimed by the client, although he already has what he really paid for, viz. the building itself. It is pointed out that an architect is not

paid for making drawings, but for producing a building, the drawings being only his necessary instructions to the workmen; under some circumstances he might even dispense with drawings altogether. To require him to hand over to the client drawings and specification, which represent the result of his professional experience over many years, for the client to use as he pleases is a manifest injustice to the architect. Moreover, the custom in the profession of handing over the drawings to the client when the building has been planned, but not carried out, is a mistake on the part of the profession; as in such a case an unscrupulous client has only to say that he has changed his mind in order to get possession of the drawings and use them as he pleases, with no further compensation to the architect. The wording of Clause I. of the Institute Scale of Charges is most unfortunate, as it appears to state (though not so intended) that the architect's commission is for producing drawings of a building. The wording of this clause should be amended. The author moves the following resolution:—

"That, in the opinion of this meeting, the Royal Institute of British Architects, having revised the wording of its paper on the professional practice as to the charges of architects in the sense indicated above, should as early as possible take steps to get a Bill introduced into Parliament for securing the adoption of their scale of charges, so amended, as part of the law of the land."

By D. PABLO SALVAT (Spain).

1. Architectural property ought to be recognised and enjoy identical rights with those of intellectual property in general.

2. Each country ought to fix, as far as it is concerned, the limit of duration of copyright, but in no case ought this limit to be less than twenty-five years, counting from the death of the author.

3. In no case ought the design, that is to say, the idea expressed in terms of architectural art, to be reproduced without the author's consent.

4. The architectural work ought never to be reproduced either in its whole or in any one of its details, no matter for what constructional purpose, without the author's consent.

5. The architectural work may be reproduced in sculpture, drawing, painting, photography or engraving, provided the author has not expressly and publicly signified his absolute prohibition.

6. The right of ownership is inherent in artistic work. It is constituted *de facto*, without need of registration or deposition of any kind. For copyright to be guaranteed signature and date should be sufficient.

7. Assignments of copyright should be made in the same form as assignments of personal property at the will of the contracting parties.

8. The author should specify in the assignment the points as to which he reserves copyright.

9. Any contract without restrictions implies an assignment also without restrictions.

10. Assignment without restrictions does not deprive the author of the power to reproduce his own works, but the assignee can, by an express condition, demand the right to oppose it.

By GASTON TRÉLAT (France).

In the matter of art, in the matter of architectural elaborations, there is no artistic property. In architecture the proportions of a piece of land, the building site, the surroundings, are all elements which must be taken into consideration in making the studies for the composition of the plan. The mind of the artist is haunted by too many equally decisive ideas in the orientation of his work that any other mind could grasp the leading idea of his conception. The arrangements and the co-ordinations are all connected with it. It is a law from which the artist will never be able to free himself under the penalty of turning out bad work, and consequently of injuring his own personality. Artistic property does not rest upon a sufficient examination of the question; it could not support a conscientious and logical analysis. The result of it is therefore, in my opinion, an action without profit and a regrettable loss of time.

By GEORGES HARMAND, Avocat.

Maitre Harmand proposes to move the following resolution:—

This Seventh International Congress of Architects assembled at London in 1906, recalling on the one hand the resolutions passed during the past twenty-eight years by the International Congress of Architects and the International

Congress of Artistic Copyright, as well as by the International Congresses of the Association Litteraire et Artistique Internationale, notably at Madrid in 1904; recalling, on the other hand, the *Protocole de Clôture* of the Diplomatic Conference held at Paris in 1896, which upholds the principle of complete protection of works of architecture; recalling, finally, the Spanish law of 1879 and the French law of 1902, both of which expressly protect works of architecture.

This Congress is of opinion:—

1. That architectural designs comprise designs of façades, exterior and interior, together with the plans, sections and elevations, and they constitute the first manifestation of the architect's idea and the work of architecture.

2. That the building is but a reproduction, on the site, of the architectural drawings.

And this Congress renews the resolution that works of architecture be protected in all legislative enactments and in all international conventions equally with every other kind of artistic work.

The following resolution was passed:—"That this Congress is of opinion that the architect is employed to produce a building, and that all drawings and papers prepared by him to that end are undoubtedly his."

Messrs. G. Harmand, G. O. Totten, W. Reid, A. Augustin Rey, W. H. Atkin Berry, A. Kelsey, E. Fritchby, H. H. Statham and others joined in the discussion.

Papers dealing with the laying-out of streets and open spaces in ancient and modern times were read before a section of the Congress on Wednesday evening at the Grafton Galleries. M. Ch. Buis (Belgium) occupied the chair, supported by Sir William Emerson.

THE PLANNING AND LAYING-OUT OF STREETS AND OPEN SPACES.

By CH. BUIS (Belgium).

IF it is desired to lay down the rules to be followed for the creation of streets and squares, the following three hypotheses must be considered:—

First, an entirely new town to be founded. This is a rare occurrence in Europe; an instance of it is Zeebrugge in Belgium.

Secondly, a quarter of an old town to be transformed into a modern quarter. In this case it is necessary to leave untouched the picturesque aspect of the quarter, to preserve the historical monuments, while endeavouring at the same time to satisfy modern requirements.

Thirdly, a new suburb to add to an old town. Establish the plan of the principal directions of circulation, adapt it to the topography of the place, determine the character of the quarter according to its destination, *i.e.* whether to be of a commercial, industrial, administrative, popular, university, middle-class or aristocratic character.

Servitudes to be established to preserve to it the character it is intended to have. Expropriation by zones or participation of the owners of the land in the management expenses.

FORMS OF THE STREETS.—Straight or almost straight principal arteries; sinuous secondary streets. The straight streets must not be too long; after every thousand metres they must be deviated or end in a monument. The squares arranged in these streets must not be circular, but oval. They can, besides, be varied by not giving a uniform width to the whole street.

INTERSECTION OF THE STREETS.—Avoid converging the circulation to a single point; it must, on the contrary, be distributed over the whole town. Cross-shaped intersections should be avoided.

OPEN SPACES.—In ancient times the public squares were the forum as the political centre and the market-place as the commercial centre. In the North in the Middle Ages there was the open space in front of the church and the large market-place in front of the town hall.

1. *The Squares for Circulation.*—The star-shaped squares are to be condemned; they lead to congestion in the circulation and form a too cut-up picture. The streets must end in the corners of the squares.

2. *Markets.*—The centre of the market-place must be free; the streets leading to it must not be numerous and must end in the shape of turbine paddles.

3. *Garages.*—Squares outside the railway stations; there the circulation must be divided by open spaces, fountains and statues. Towards the town there should be a monu-

mental entrance. Within the town spaces must be reserved for cab-stands.

4. *Ornamental Squares*.—Squares planted with trees. They can be made of any shape.

5. *Monumental Squares*.—Squares created to produce an artistic effect. The height of the houses should be in harmonic proportion with the dimensions of the squares. Rules established by M. H. Martens. Rectangular squares in the proportion of 1 to 3, trapezoidal and triangular ones. Circular and octagonal shapes to be condemned. Oval shape admissible. Framing of the squares to be recommended; dissimulate their openings by gates, arcades, &c. Streets opening into them in turbine-paddle shapes. Grouping of the squares produces a picturesque effect. These squares may surround an edifice. Decoration of squares. Sometimes symmetrical, but as a rule the absence of symmetry is preferable. It is better not to place the statues and fountains in the centre of the square. Levelling of the squares. The concave surface is to be preferred for æsthetic and practical reasons.

The principles which we have just explained are the result of the research of practical means which can make a modern town comfortable and hygienic and impart to it a beauty which renders a sojourn in it pleasant.

A town must not only be a commercial store and an industrial factory, but also a home for human beings.

Since the towns are no longer formed by the slow increase of centuries they have lost their picturesque charm and their national character.

To the unconscious work of the builder of ancient times must be substituted the conscious work of the modern builder. The mission of our town architects must therefore be to adorn the towns with a new beauty, the elements of which will be furnished by the wants of a heavy traffic, of a healthy life, by æsthetic principles, derived from the study of the laws of artistic enjoyment.

By B. POLLES Y VIVÓ, J. MAJÓ Y RIBÓS, M. BERTRAND DE QUINTANA (Spain).

In laying out open spaces account should be taken of various circumstances, those especially which are attendant on the climate of the locality, though varying according to latitude, altitude, direction of dominant winds and the greater or less distance from the sea and great rivers, the position of neighbouring mountains, frequency of rains, nature of soil, &c. Of all these circumstances, those which have a preponderating influence are the direction of the dominant winds and the latitude.

What evidently demonstrates the importance of the direction of the dominant winds is the position of edifices included in the category of insanitary buildings, which, on account of the many emanations affecting the atmosphere, should not be so situated that the currents of air may carry these insanitary emanations into the open spaces of a city, thus converting into a focus of infection the air which our dwellings receive from outside.

In consequence of this, one ought to study conscientiously the situation of a cemetery, a crematorium, an establishment for the filtration of infected water coming from a system of sewers, a hospital, a lazaretto, certain industries, &c.

With regard to the latitude, or distance from the equator, and setting aside the differences of temperature consequent on the greater or less distance from the poles, and following the geographical points which are under consideration, one of the most important factors in the solution of the problem, and one on which we ought to fix our attention, is the consideration of the angle formed by the solar rays with the plane of the horizon of each locality, an angle which diminishes as the latitude increases.

According to the reports of the International Congresses of Tuberculosis, and of Salubrity and Hygiene, held recently at Paris, it cannot be doubted that one of the essential points to be secured is to place the dwelling in hygienic conditions, and that its façades should be so exposed as to receive the rays of the sun and pure air for as long a time as possible. To obtain this result it is obvious that we ought to orientate the streets, determine their width and fix the height of houses, so that the access of the sun's rays should be assured.

The various open spaces for each city, streets, squares, promenades, &c., and those by analogy reserved as courtyards to facilitate the access of air and light to houses, ought to increase in breadth as the latitude of the locality increases, whilst the heights of the houses ought to lessen as the latitude increases; in other terms, to avoid one façade

casting a shadow upon another the breadth of the streets must increase proportionately with the latitude of the locality, and the heights of the houses must lessen in the same proportion.

To give to the subject we have just sketched all the development that it deserves would take a volume filled with scientific and learned explanations, and as these notes are intended for an audience composed of experts we would like to avoid falling into this error, and we will conclude our remarks on the portion of the hygienic problem intimately allied with the title of the theme we are discussing, with the following conclusions:—

1. That the means of communication in cities should be laid out so that in no case should they serve as a canal to conduct the impurities coming from unhealthy industries, which necessarily exist in all centres of population; that is to say, that strict care must be taken that the situation of these buildings be fixed in such a way that the dominating winds can never carry into inhabited localities the unhealthy emanations from them.

2. That the dimensions of open spaces in a city should be subordinate to the density of the population as well as to the latitude; in other words, the more populous a city the greater should be the area of its open spaces; a condition which can be obtained through the means of communication and the courtyards belonging to houses. Considering besides that the sun is essentially the purifying element, in order to obtain its presence for the longest time possible in the fronts of buildings it is necessary to increase the area of open spaces and to diminish the height of constructions as the latitude of a city increases.

By Dr. J. STÜBBEN (Berlin).

I. *Planning of Streets.*

The direction and width of streets depend on the claims of the traffic to be accommodated. Traffic must everywhere and in every direction find a clear view and an unimpeded path. In main thoroughfares the width desirable may be 50 metres or more; in by-streets, where the traffic is solely for the service of the residents, the width may be reduced to 8 metres. All intermediate widths depend on the circumstances of each case.

The gradients of streets should be as flat as possible. In level districts gradients of more than 1 in 70 should be avoided as far as may be, because they interfere with the asphaltting of the road surface. In hilly districts gradients up to 1 in 20 are permissible in the case of main thoroughfares, and up to 1 in 10 in the case of side-streets. Where steeper inclines have to be dealt with stairs or footways should be provided. The latter should be employed more frequently than is at present the case on mountain slopes and for diagonal crossings of long blocks.

For hygienic reasons streets running due east and west should, where possible, be avoided, because the houses on the south side during the greater part of the year do not receive direct sunshine. The width of a street should be at least equal to the height of the houses in it. Broad streets should be planted with rows of trees and garden plots. Forecourts in front of the houses favour the access of light and air, and often allow a reduction of the width of the roadway. Very wide and bare streets are to be avoided, owing to dust clouds and lack of shade. The same remark applies to long straight streets, especially when they lie parallel to the direction of prevailing winds.

On purely æsthetic grounds there is as much to be said for straight streets as for crooked ones, and for a regular as for an irregular building line. In hilly districts curved streets facilitate traffic and the laying-out of sites. In level districts the adoption of straight or crooked, regular or irregular lines depends both on practical considerations and also on the artistic intentions of the designer. Straight streets of great length should be avoided; the remedy is to curve or change the direction, also transposition of the direction or building lines. Transpositions are, however, only permissible in so far as they do not interfere with a clear view of the traffic. Convex changes of gradient are to be avoided in straight streets as far as possible. Concave levelling is to be preferred. Unavoidable stopping points ought to be treated artistically as terminal points. Every street ought as far as practicable to be planned individually. A change of width in different parts of the same street may serve to add to its beauty. Self-contained street pictures are everywhere to be aimed at.

II. *Planning of Open Spaces.*

Open spaces are required for dealing with streams or traffic at points where streets converge, at railway stations

bridges, city gates, &c. For practical reasons it is desirable that the various lines of traffic should not intersect one another at one point. Spaces devoted to traffic lack, as a rule, one quality of artistic importance, viz. the setting of a proper frame. They can, nevertheless, be made to present a pleasing appearance. The lack of a suitable frame may be to some extent compensated by so arranging the lines of the streets that the eye travels over the open space and rests on a boundary wall. Useless traffic areas resulting from the unnecessary meeting of streets are to be avoided.

Market-places should be near to some main thoroughfare, but their main area should not be open to vehicular traffic.

A considerable number of open spaces are desirable in the interests of fresh air. They should occupy at least one-tenth of the total area of a town. Spaces planted with trees and flowers, such as gardens and recreation grounds, are important to health, as are also public parks and promenades.

The chief artistic quality of open spaces lies in their being as far as possible enclosed in a proper setting. This applies to market-places and gardens, but especially to spaces of a purely architectural character, i.e. spaces intended as sites for monumental buildings. The preferable position for these buildings is at the side of the open space rather than in the centre. In this latter position the necessity of a framing for the remaining portions of the space holds good. Porticoes and porches, which can be carried out into the street openings, help to close in the frame. Errors in scale, especially unduly large open areas, are to be avoided. Convexity of the open space is inadmissible. Concavity is preferable. Each open space should, as far as practicable, be laid out individually.

Combinations of spaces are subject to various requirements, according to the purpose for which each is intended, e.g. whether it be for purposes of traffic or as a site for monumental buildings. The grouping of several separate spaces can be made to produce fine effects from an artistic point of view.

III. Planning of Cities.

Modern ideals are in the main based on the principles given above for the design of streets and spaces. We cannot simply imitate the cities of an earlier age, since the requirements of the traffic and of hygiene have altered. That the ground plan of a city should be clean and orderly is of importance. The task of the artist lies in a perfect adaptation to use, combined with beauty of form. In other words, the arrangement of the open-air space shall satisfy æsthetic demands, while at the same time it must provide, as completely as possible, for convenience of locomotion and health.

In addition to the claims of traffic, health and beauty, economic and social considerations require attention. The streets and blocks of buildings must, in their character and dimensions, conform to the economic and architectural necessities of the inhabitants. Broad main thoroughfares must be provided for the bulk of the traffic, narrow side streets of private houses serve to divide the area to be built on into separate blocks. The various parts of the city ought, even in the first rough plan, to be divided up in accordance with the purposes they are intended to serve, viz. into rows of houses or detached and semi-detached buildings; into tenements or private houses; dwellings for the upper, middle, or working classes; shops and retail or wholesale manufactories, &c. Attention should be paid to their relative position in regard to the centre of the town, the surrounding country, the railways and the harbour.

As in the case of isolated thoroughfares and open spaces, so too in the case of whole quarters of the city individual character should be aimed at.

Ancient monuments of all kinds, as well as fine existing streets and views, ought not only to be preserved, but should be taken advantage of in order to secure a characteristic development of the city on artistic lines.

By GASTON TRÉLAT (France).

Streets are never wide enough to allow the traffic in the roadway to develop without leading to obstructions. These latter occasion loss of time inconsistent with the rapidity which the means of locomotion tend to insure; again, they lead to a confusion in the streets which is not in harmony with objective beauty. The leading fact of the day is a more and more accentuated rapidity of movement from place to place, thanks to which the former suburbs of capitals or towns are joined, or can immediately be joined, to the centres of the agglomerations. Hence the possi-

bility of assimilating these new localities to the old districts where the urban employments are centralised. Thither, then, should be transferred the dwellings which up to the present have crowded the centre of the towns, where they tend to spread transmissible and preventable diseases.

The enlarged agglomerations would gain considerably in healthiness and brightness, in contrast with these faulty concentrations of dwellings, cramped and one above the other in comparatively restricted spaces.

Uninhabited areas could take the form of parks, squares, gardens, avenues planted with trees, and even private squares could be made on pieces of ground large enough, so that the buildings would line the public roads. And all this should be planned and settled before it is too late. This necessary preliminary work should be carried out under the ægis of the municipal authorities independently of the exigencies of execution, which should be effected according to financial possibilities and intentions. Nothing should be executed which is not in accordance with general harmony, of which it is expedient at once to have some idea, in order to insure the realities, such as present knowledge bids us consider them.

This would therefore be a technical focussing of the progress that science faces in our days. From this would follow later the prescribed realisations in accordance with the views that our intellectual life may well admit of.

It is necessary to get away from the antiquated methods which up to now have served as the bases of the regulations of the highway authorities. In order to do this it would be expedient to appeal to competent meditations and deliberations, all having as their primordial object the health and well-being of the community. For it is in the exclusive interest of the community that such regulations ought to be made.

Conclusion.—Consequently there is reason to express the desire that for all important agglomerations plans should be studied without delay. They would have to take into account the conditions inspired by science and which interest health, such as rapidity of movement from place to place.

These plans would therefore require a focussing of the technical solutions to be drawn from science. They would be carried out according to local requirements and budgetary possibilities. But nothing would be done which was not in accordance with an ideal in keeping with the knowledge of the age.

By RAYMOND UNWIN.

It is the regulation of the vast growth of residential districts around our towns which is most required in this country. Valuable suggestions may be obtained quite as much from old English villages and towns as well as from the ancient continental towns which the school of Camillo Sitte have taken so much as their model.

Both alike suggest the great importance of defining and limiting suburban areas. Old towns were often defined by their walls with beautiful effect. We need to replace with some more comely girdle the ragged edges and rubbish heaps which surround our modern suburbs; belts of park land, meadow, wood or orchard, often of quite narrow width, might be used with good effect.

In suburban areas the larger buildings will be few, but should be grouped so as to produce some enhanced effect and some definite centre for the life, as well as for the plan, of the suburb or district. The judicious use of planting may help to link together buildings in centres where there may not be enough fine buildings to make an adequately large enclosed place. The growing desire for greater space and more openness of outlook is an important and difficult element in our problem.

Before attempting to lay out a new area the site must be very carefully studied, a contour plan must be made, and a survey of trees and many other features of interest. Even well-grown hedgerows may sometimes be helpful: anything that will break the naked newness of a suburban area should be preserved. The plans should be thought out on the ground and committed to paper afterwards. It is impossible to study too thoroughly a site and its conditions; the proper directions for the main roads, the various centres, factory areas, &c., should be all settled on the site. A symmetry which will look nice on the drawings is of no value, but definiteness of figure in the main framework formed by the chief roads of a town or district is certainly valuable to enable people easily to find their way about. The whole of the plan should be based on definite reasons rather than abstract rules, and one cannot be too willing to consider suggestions from the site. Rules cannot be laid

down in favour of straight or curved roads; each form has its beauty and use; the mere aimless meandering road will be quite as monotonous as the straight road. The contour of the ground or existing features having curved lines springing from natural causes may suggest very beautiful curved roads, but straight roads opening up a beautiful view, or affording fine avenue effects, may be equally satisfactory. Each road should be given some distinctive character, which may be enhanced by planting it with a special kind of tree. Greater variety than at present should be allowed in the width of the roads, in their construction and decoration, according to the purposes they will serve; by-laws need revising in this respect. Great care is needed in decorating roads with trees or gardening; everything must be kept very simple and broad in effect. The dignity of many fine streets and parks in continental towns has been destroyed by the introduction of wriggling lines, of beds of variegated foliage and such like.

The best direction for roads to take for residential purposes depends so entirely on the designing of the houses that no rule can be laid down. Roads running east and west may give a south aspect for all the houses, provided only that the superstition that a house must have a tidy front to the road and an untidy back away from it can be exploded, and houses for the south side of the road be designed with their living-rooms facing from the road and their so-called backs made tidy and presentable to face the road. The advantage of roads running north and south, or thereabouts, is that both sides of the houses get an equal amount of sunshine. An important improvement required in suburban districts is the better grouping and arrangement of the houses. Endless repetition of detached or semi-detached buildings becomes quite as monotonous as the endless rows of houses. Valuable suggestions may be obtained from our old village greens, cathedral closes and college quadrangles. Even the throwing together of a few front gardens may help matters, but where smaller houses can be built in groups, and the groups be designed as a whole, and where such groups of houses can be arranged on two or three sides of an open garden or green, or even where they can be set back from the road at varying distances, not only may variety and beauty be given to the road, but greater openness of outlook may be provided for the houses, and very often some small distant view may be given.

Variety of effect in the streets is very desirable, but it must never be forgotten that mere variety is not in itself necessarily pleasant, in fact is seldom really satisfactory unless it is variety within some enclosing unity. For the town-planner it is most necessary that he should understand wherein consists what we call natural beauty, and while he should seek every opportunity that the site may afford of pleasant natural beauty and the interest and picturesqueness of happy accident, he must never forget that he cannot design happy accident or natural beauty.

Mr. F. MILES DAY, at the conclusion of the papers, explained the proposed schemes for the laying-out of Cleveland, San Francisco and other American cities. His remarks were illustrated by lantern views, which appeared to illustrate the ideas advanced in the papers.

Mr. A. KELSEY and Mons. A. RAY also expressed their views.

The chair was taken by M. E. V. Dahlerup (Denmark) and Mr. Graham, with Mr. Cowper and Franze de Vestil acting as joint secretaries.

Preparatory to the papers being read, Commendatore Alfredo d'Andrade, on behalf of the Italian Government, proffered several illustrated volumes dealing with their attitude towards the conservation of national monuments.

CONSERVATION OF NATIONAL MONUMENTS.

By Professor G. BALDWIN BROWN, M.A.

THE buildings and works of art that have come down to us as a legacy from the past represent national assets which can never be increased, and the problem how best to deal with them is the same in all European countries, though it has been approached, grappled with or evaded in different fashions. A knowledge of the principles and practice that obtain abroad must necessarily be of value to those interested in this question in our own country.

Continental governments have expressed their solicitude on this matter in various fashions, the most common and one of the most effective of which has been the establishment of State Commissions charged with the upkeep

of national treasures of architecture and art. Some of these Commissions have been at work for the best part of a century, while others, as in Holland, have only recently been appointed. They exist in at least a score of European countries. Apart from the maintenance of State Commissions, continental governments have shown their care for monuments by issuing numerous rescripts, royal and ministerial, some of which date back to the seventeenth century. The Prussian and other German Governments have been specially active in this department, and about fifty Prussian rescripts of the kind were promulgated between 1815 and 1881.

The work of Continental Monument Commissions, whether or not this is carried on under a formal Monument Act, is generally based on a list or schedule of national monuments which are worth preservation either on artistic or on historical grounds. This implies a process of inventorisation. Such a survey of the national assets in this department is in progress in almost all European countries, and here again Great Britain is conspicuously behind her sister nations. In our own country there is a precedent for State action of the kind in the Department of Historical Manuscripts, on the cataloguing of which a Royal Commission has been at work since 1869. Nothing of the kind has yet been attempted for works of art and historic buildings. There is, however, a growing demand for some State action of this kind in the British Islands; and it is suggested that the International Congress should strengthen the hands of those who are working in this direction by a memorial in favour of a Government scheme for the survey and inventorisation of the vast treasures in ancient monuments and works of art which this country possesses, and for which there is practically no legal protection. It is generally acknowledged that the British Government owes something in this department to the country, and the appointment of a Royal Commission for the purposes just indicated would be the most practical measure that could be adopted.

By A. BESNARD (France).

It is absolutely important that the Governments should have the power to bring about the obligatory expropriation in every case where a monument which presents an historic, artistic, or archaeological interest shall not be kept in proper repair by its owner.

That never, unless it be absolutely and immediately needed, should administrations be allowed to carry out, or to authorise private persons to carry out, works which may cause the disappearance or the ruin of a monument the historic or monumental interest of which is recognised by all.

That everywhere where the site shall form the natural frame of the monument it shall be prohibited to touch it in any way whatever.

That in the formation of streets and sewers the administrations shall be bound to respect the ancient monuments which happen to stand in the line of the laying-out plan, and that in certain cases these monuments shall be made the basis of such laying-out plans.

That in case it should be found absolutely impossible to preserve a monument, it shall be the duty of the administrations, before any demolition work be started, to take photographs, and make faithful abstracts and casts to be deposited in the local museums, and that the fragments of architecture, sculpture and locksmith's work coming from the demolition of such monuments be distributed among the local or regional museums.

That particular instructions shall be issued as to the mode of proceeding in these demolitions.

That encouragement shall be given to such municipalities to suppress any parasitic structures which hide from view the monuments of the past.

That wherever it is possible the monuments shall be preserved for their original purpose, and that for the others measures of hygiene and salubrity shall be taken which will allow them to be utilised. A considerable number of old houses which are interesting from a monumental point of view could thus be preserved to posterity.

That at no time shall the municipalities be authorised to entrust with such work agents of the local public service, but always architects appointed by the Government.

That in the case of enlarging a town the public authorities shall be obliged to preserve its primitive aspect in the main outlines, and thus make it possible to perpetuate its original character.

That advertising shall be strictly prohibited on and around the monuments.

That archæological inventories made on a uniform plan shall be compiled everywhere, so as to secure the perfect and complete knowledge of all the national art treasures.

That in cases where the credits will not allow the immediate execution of the work of restoration of the monuments, measures of protection shall be imposed (particularly with regard to sculptures); and as a first consequence that in all buildings devoted to religious services the tumular flagstones shall everywhere be taken up and placed against the internal walls of the buildings.

That in the case of restoration, instructions, based on a standard programme, shall be the rule for the architects appointed to carry them out. Among these rules we would mention especially the obligation of preserving to each monument, for all the parts to be restored, records of the previous state. To use (in all cases where this will be possible) the original materials and to respect the dispositions of the ground plan, these dispositions being elements of the characteristic features of the different styles.

That previous to any restoration a very accurate report on a large scale of the actual condition shall be taken, with casts of the sculptures and the most characteristic profiles.

That general rules shall be established for the placing, the maintenance and the restoration of painted glass windows.

By W. R. LETHABY.

While the science of archæology was being built up experts were betrayed by their knowledge and enthusiasm. They did not think of the difference between the mere form of an old monument and the living building itself. Even when they did not make all new, they refused to see how they wounded the old by placing their conjectures by the side of it. Restorers acknowledge that harm was done in the past, and then with professions of sympathy they go and do likewise, taking the new word "repair" in place of the old word "restoration," but with similar result.

Renewal is going forward at quickened rate all over Europe, and the most ancient and beautiful buildings are those which are passed through the mill of restoration and left desolate. St. Front, Périgueux, excited so much interest that it was made over again. The Dom at Aachen is being covered up with fashionable marbles and mosaics; Murano Cathedral looks as if it had been supplied from a factory, and so with many others.

In every country protests have been made—in France lately by Emile Hovelague, in Germany by Strzygowski, in Italy by Boni, in England by Ruskin and Morris—but the custodians of ancient buildings and their architects make a few verbal concessions and go smiling on their way.

The alternative to this method of dealing with old buildings is persistent care and repair, as of national treasure to be guarded. As fragmentary works in a museum seem all the more precious for showing a history of antiquity and loss, so it is with an old building; and if it be cared for in this spirit of proud guardianship, no necessary strengthening and upholding will harm it.

It is usual to object that old buildings are not in museums, and have to be maintained for use; but no proper use is hurtful. The use and stability of our cathedrals have been sacrificed to the caprices of ornamental decoration. If the principle is accepted that our object is the preservation of the integrity and authenticity of a monument, we can hardly go wrong in carrying out needful repairs. Much experience is stored up in the papers issued by the Society for the Protection of Ancient Buildings.

If architects must restore, let them do it on paper only, without impairing the evidence of the building itself, evidence which disappears when they actually build their theories, so that we have not even the satisfaction of being able to prove them wrong.

We can hardly go to any famous building in Europe without finding extensive works in progress, and unless there is soon some great change of policy there will be little left that is truly old to hand on to posterity.

By JOSEPH ARTIGAS Y RAMONEDA (Spain).

From determining the "nature of national monuments," deciding "to whom they belong," and fixing the "advantages of their conservation," it follows logically that the only way of preserving them is incumbent on peoples and Governments, on the latter resting principally the sole responsibility for their loss, for the reason that they alone have the active authority to avoid it, and the charge of the necessary public moneys to preserve them from the natural

decay which the parts must suffer both through the action of time and from the destructive hand of man.

TUSCAN COLLEGE OF ENGINEERS AND ARCHITECTS.

In a memorandum read at the second Congress of Engineers and Architects in Florence in the year 1875, bearing the heading, "On the Preservation of the Monuments of Art and Archæology," at the time when it was proposed that the Government should lose no time in passing a law for such preservation, Professor Poggi set forth his conclusions as follows:—

(a) That it would be necessary to render it obligatory in cases of important restorations of national monuments to obtain the previous decision of the consulting provincial commissions.

(b) That the monuments belonging to private individuals should be submitted to the same law of preservation, adopting the course which shall be deemed most convenient. In any case it should be ruled that the private monuments should form part of the general inventory of the monuments of the nation.

(c) Before the consulting provincial commissions enter upon their duties, the foundation and the principal evidence for the preservation and restoration of the architectural monuments in question, and for the formation of the inventories of those which must be declared to be of national interest, should first be discussed and established by architects and other artists, as well as by archæologists and other competent persons. These inventories should be accompanied by the plans, sections and perspective views considered necessary to give a clear idea of the present state of the monument, and of the necessity of its restoration and preservation.

(d) Appeal should be made to the Government itself, with a view to steps being taken to constitute a fund or a revenue which will furnish the means for carrying out and observing the law in a convenient manner, either by the Treasury making return of such part which it might have unlawfully appropriated and which was to be used for the preservation of works and monuments of art, or by issuing such measures as will be considered most to the point. And there being among these measures that of the entrance fee for visiting the museums, art galleries, antique monuments, &c., it is to be hoped that the receipts therefrom will be entirely destined for the above purpose.

On later occasions Professor Poggi expressed the view that the means at disposal should be put into operation at once for the restoration and the preservation of the large number of architectonic monuments which suffer, and the importance of which becomes known on the occasions when new excavations are opened and when searches are made for remains of Etruscan, Greek and Roman monuments.

"Italy," he wrote, "is already recognised by the whole world as a great country on account of her numerous and varied monuments which have been uncovered. It is not urgent to excavate the buried remains, because in the state of preservation they are in now they will be found unaltered in a couple of centuries, but we cannot say the same of those which are visible objects of admiration and of study, and of which it behoves us to arrest the decay without delay, unless we are to see them pass away from us for ever."

By GASTON TRÉLAT (France).

If the State is a chief synthesis of collective interests the Government is the effective agent of the measures which these interests demand.

Now, monuments are important elements of national beauty. As such they form part of the preoccupations which in our days public art would tend to claim and bring within its compass.

This new institution has already taken a place in parliamentary deliberations with regard to the preservation of sites, and, finally, Governments have no longer the right to be indifferent to it. National monuments are important elements of public beauty. They have, therefore, a conspicuous place, with this inherent and distinctive feature, that they were included in the former classification of the fine arts.

If governments should be indifferent to their preservation and maintenance, it would be going against the great fact which becomes more and more evident and which takes a character of social progression to at least honour our time.

Monuments are a source of public beauty, and their preservation ought to be submitted to the deliberations of

competent persons representing the collectivities interested. Consequently it involves in the highest degree the responsibility of governments.

To facilitate the double operation, as well as to effectively instruct the public as to the results expected, there is reason to desire that, whenever it is shown to be useful, the custom of making temporary models before any definitive execution should be extended.

The following resolution, proposed by M. A. BESNARD and seconded by Mr. W. D. CAROE, was carried:—"That the Governments should be empowered whenever occasion arises to expropriate a monument which is historical, archaeological or artistic." Afterwards Mr. A. GRAHAM proposed, "That this International Congress of Architects recommend that the British Government be approached with a view to appoint a Royal Commission to control and extend the operations of the Ancient Monuments Amendment Act of 1900, and prepare a catalogue of ancient monuments, whether historic or prehistoric, of the British Isles, taking similar action to that of the Department of Ancient Manuscripts and in agreement with the measures adopted in other countries." This was seconded by Professor G. BALDWIN BROWN, and carried.

Reports of further papers in this, and those read in the other sections, will appear in our next number.

STRAND FRONTAGE QUESTION.

THE following is the report of the improvements committee (No. 2) of the London County Council upon the proposed alteration of the northern frontage of the Strand between the two churches:—

The Council will remember that on July 28 and October 20, 1903, we reported fully on suggestions which had been made for altering the northern frontage of the Strand at the part affected by the Holborn to Strand improvement. These suggestions were made by Mr. Hamo Thornycroft, R.A., by an association of private persons known as the Further Strand Improvement committee, and by the Royal Institute of British Architects. The Council's architect, upon our instruction, also prepared a plan. The objects were (a) to bring the church of St. Mary-le-Strand into alignment with the centre of the Strand, (b) to make the direction of the Strand aim at the front of the church of St. Clement Danes and not at one corner of it, and (c) to secure for the future a good view of the Courts of Justice to all approaching that building from the Strand on the west. The cost of adopting these suggestions was estimated by us at 360,000*l.*, 249,400*l.*, 74,000*l.* and 63,000*l.* respectively. The Council on October 20, 1903, decided to make no alteration in the existing line of frontage, on the grounds that not one of the proposals offered sufficient advantage to justify the Council in incurring the great expense which would be involved. This resolution, with a copy of our report, was communicated to Mr. Thornycroft, to the Royal Institute of British Architects, and to the Further Strand Improvement committee.

Since that date we have had before us the under-mentioned memorials, &c., asking that the matter may be reconsidered:—(i.) A memorial signed by Sir Edward J. Poynter, P.R.A., Mr. Hamo Thornycroft, R.A., Mr. T. G. Jackson, R.A., Mr. R. Norman Shaw, R.A., and several other prominent artists and architects; (ii.) a letter from the Royal Institute of British Architects; (iii.) a letter from the Architectural Association; and (iv.) a memorial from the Further Strand Improvement committee, the Royal Academy of Arts, the Institute of Bankers, the Surveyors' Institution and others.

A meeting of persons interested in this last proposal was

held at the Royal Academy in March last, when a resolution was passed to the effect that the memorialists had made out a clear case against the Council's plan. A deputation consisting of Lord Claud Hamilton, Sir Edward Poynter, P.R.A., Mr. R. Blomfield, A.R.A., and others attended before us, when Mr. Blomfield, speaking on its behalf, criticised the frontage line adopted by the Council, contending that it would be most inconvenient for traffic in consequence of the abrupt bend to the north-east, which would be necessary in order to enable the traffic to clear the Gladstone monument, whereas the advantages of a straight run from St. Mary-le-Strand to the monument were obvious; and that the architectural vista in each direction would be lost. Mr. Blomfield pointed out that St. Clement Danes Church, with the new buildings to be erected on the Council's land, would block the view of the Law Courts; that the general axis line of the Council's scheme would not be parallel to the axis line of St. Mary-le-Strand Church, so that the church would be left out of relation to the general scheme; that, as the frontage line left more than half of St. Clement Danes out of account, the two churches would not be brought into touch; that the position of the Gladstone monument would emphasise the absence of any consecutive idea; and that by the southward dip of the alignment, the view down the Strand to the west of St. Mary-le-Strand Church would be intercepted by the church. He suggested that, in general, the Council's proposals appeared not to have grasped the full possibilities of the case; that it limited itself to the ground between Wellington Street and St. Clement Danes, whereas it should have taken into consideration the whole space from Wellington Street to the east end of the Law Courts; that if this were done, a superb architectural vista would be assured; that the Law Courts would be brought into relation with the important new buildings which would occupy the ground to the west; that the churches of St. Mary-le-Strand and St. Clement Danes would fall into their places as architectural monuments of great beauty and interest, standing clear in what might be made one of the finest roads in the world, and that thus, at a relatively small cost, London would gain architecturally the unearned increment of the money spent in the past upon all those excellent buildings.

The scheme advocated by the Further Strand Improvement committee provides for the addition to the public way in the Strand of a small part of the central portion of the crescent site, and of a much larger part of the site at the eastern horn of the crescent site. It is proposed to alter the position of the eastern spur street between the Strand and Aldwych; this will have the effect of curtailing very considerably the area of the site which the Council has agreed to lease to a syndicate at a rent of 55,000*l.* a year. Finally, it is proposed to form in the centre of the Strand immediately to the east of St. Mary-le-Strand Church an island pavement, about 430 feet long, with an average width of about 35 feet. It is suggested that trees might be planted and memorial statues erected on this pavement. Having regard to the heavy cost which this proposal would entail, both in respect of the value of the land given up and the risk of jeopardising the completion of the letting, we felt that we should not be justified in advising the Council to adopt it in its entirety. With a desire, however, of ascertaining whether it would not be possible to meet in some way the wishes of the eminent authorities in matters of art who had approached us, we instructed the architect in conjunction with the other officers to report, with full details of the cost, on any suggestion which they might be able to offer for altering at relatively small cost the line of frontage of the eastern horn of the crescent. This was done, and in order that the matter may be fully understood we give the subjoined table:—

Suggested modified Line of Frontage.	Average width suggested for the Strand.	Value of Land Surrendered to Public Way.	Estimated Cost of Altering Vaults, Paving, &c.	Total Cost of adopting suggested Alteration of Frontage.	Cost of Erecting Buildings on Land given up.	Annual Rateable Value of Land and Buildings.	Loss in Rates per Annum.		
							To other Rating Authorities at 3 <i>s.</i> 8 <i>d.</i> in the <i>l.</i>	To the Council at 3 <i>s.</i> in the <i>l.</i>	Total.
(a) Further Strand Improvement committee's scheme	Feet. 155	£ 239,400	£ 10,000	£ 249,400	£ 82,800	£ 12,690	£ 2,326	£ 1,904	£ 4,230
(b) Plan suggested by Council's architect	114	50,000	8,000	58,000	11,825	2,364	433	355	788

Although the Further Strand Improvement committee in their memorial have not dealt with figures, both the secretary of the committee and Mr. Blomfield have criticised the estimates suggested by the Council's officers of the cost of the committee's scheme. On a careful review of the facts, however, we do not see any reason to reduce these estimates.

We think it right to point out that before the Holborn to Strand improvement, as submitted to Parliament, was approved by the Council, we consulted the Royal Institute of British Architects, with the result that the scheme which was finally adopted by the Council embraced the suggestions made by the Royal Institute after we had slightly modified the Institute's plan in order to make the crescent road (Aldwych), connecting the new main street with the Strand, more symmetrical. By this scheme a minimum width of 100 feet was provided for the Strand, as well as for the streets leading to Holborn, now named Aldwych and Kingsway. The width of the Strand immediately to the east of its junction with Aldwych at Wellington Street was proposed to be 100 feet, and a similar width was provided for the Strand immediately to the west of its junction with Aldwych at St. Clement Danes Church. This width gradually increased to about 160 feet to the east and also to the west of St. Mary-le-Strand Church, in order to provide a minimum width of 50 feet for the traffic on each side of the church. In the large open space between the eastern end of the crescent site and the western side of St. Clement Danes Church, the Council agreed, on March 13, 1900, to allot to the Gladstone Memorial committee a site for the purpose of the monument since erected by the memorial committee. The minimum width of the Strand before the Council executed the widening at Holywell Street was less than 40 feet.

We have arrived at the conclusion that the width already provided by the Council for the widened Strand, namely, a minimum of 100 feet, is in every respect ample for the present and prospective traffic. It must not be forgotten that since the opening of Aldwych and Kingsway some of the traffic passing to and from the new street and the southern, eastern and western parts of London does not use the portion of the Strand between Wellington Street and the Law Courts; this part of the thoroughfare is accordingly used almost entirely by the traffic passing from Fleet Street westwards, and from the western portion of the Strand eastwards to Fleet Street. Fleet Street is being widened by the City Corporation to 60 feet, and the Council is contributing part of the cost. The portion of the Strand opposite the Hotel Cecil has been widened, at the cost of the Council, to 80 feet, and the same width has been adopted for the improvement at the portion of the Strand east of the Hotel Cecil and opposite Beaufort Buildings. It will be apparent, therefore, that while the portion of the Strand between Wellington Street and the Law Courts has been relieved of traffic which formerly passed along it, the Council has provided a width of street far in excess of that which has been adopted for other portions of the same line of thoroughfare. Moreover, the width of 100 feet is considerably in excess of that generally adopted for street improvements in the past.

With these facts before us, it appears that any proposal for increasing the width of 100 feet for the portion of the Strand between Wellington Street and the Law Courts cannot be made merely on the ground of meeting the needs of the traffic, but must partake almost entirely of the nature of an æsthetic proposal, the chief argument in support being to secure better architectural effect by bringing into greater prominence the church of St. Mary-le-Strand and the Law Courts. We are not convinced that by throwing open to view various portions of the Law Courts building and of the church the architectural effect in the Strand would be considerably enhanced, and, indeed, there are objections to the proposal from the architectural point of view. After the most anxious consideration of the matter, and with the greatest desire to give the fullest weight to the views of the distinguished artists who have favoured the Council by their views, we feel that the Council would not be justified in incurring so large an expenditure as would be involved in securing a doubtful enhancement of the architectural view in the Strand. Having regard to the great width already provided (100 feet), it will be possible to secure under the Council's scheme an imposing effect for the buildings to be erected on the northern side of the Strand.

We have caused to be hung in the council chamber a cartoon plan showing, by black lines, the scheme as

executed by the Council; by yellow lines and dotted yellow lines the scheme put forward by the Further Strand Improvement committee; and by green lines the suggestion laid before us by the Council's architect. We recommend:—

(a) That the Council do confirm its decision of October 20, 1903, to the effect that no alteration be made in the present northern line of frontage in the Strand between Wellington Street and the Law Courts, as in the opinion of the Council no suggestion has been made which offers sufficient advantage to justify the Council in incurring the great expense which would be involved in increasing the already adequate width (100 feet) of the portion of the thoroughfare in question.

(b) That a copy of the foregoing report, and of the Council's resolution thereon, be communicated to the Royal Institute of British Architects, to the Architectural Association and to the Further Strand Improvement committee.

GENERAL.

The Death of the late Mr. Bradley Batsford on the 10th inst. removes a man who showed fine taste and appreciation of architecture as a publisher. The important establishment in High Holborn will not be likely to decline, for Mr. Herbert Batsford announces that the business will be continued by him under the familiar style of "B. T. Batsford," with the assistance of his nephew, Mr. Harry Batsford, and Mr. Smith, the head of the staff, both of whom have been engaged in the business for many years past.

Mr. C. Septimus Adye, county surveyor of Wiltshire since 1887, has died at his residence in Bradford-on-Avon.

The Memorial of Fragonard, the French painter, has been entrusted to M. Auguste Maillard by the committee.

A Street in Paris is to be named after Emile Zola, the novelist, as a recognition of his efforts to make justice supreme in the Dreyfus case.

Messrs. Roger Smith & Son, of 130 Temple Chambers, Whitefriars, E.C., have taken into partnership Mr. Harold E. Church, A.R.I.B.A., as from July 1.

Mr. Frederick Collings, architect, of Worthing, died suddenly on Monday in his seventieth year. It was stated at the inquest that he was never ill during his lifetime or required the attendance of a doctor.

Mr. George Tangye has presented to the Birmingham Art Gallery a picture by Frederick Sandys entitled "Autumn." It represents an old soldier in a red coat lying by the side of a river telling stories of his campaigns to a girl and younger child.

Mr. John Morrow has been awarded the degree of Doctor of Engineering from the University of Liverpool, and is the first recipient of the distinction. He holds the appointment of Demonstrator of Engineering in University College, Bristol.

Sir John Puleston, constable of Carnarvon Castle, states that the Office of Works has been instructed to send its architect to Carnarvon to confer with him about a more ample restoration of the castle, in which the first Prince of Wales was born.

Mr. James Shanks, the chief executive officer, has been able to give an encouraging account of the Irish International Exhibition, 1907. The fine art gallery will have a floor area of 30,000 square feet and wall space of 16,300 square feet.

The London, Edinburgh and Glasgow Assurance Company are building new head offices in Euston Road, London, N.W. The architect is Professor Berestord Pite, F.R.I.B.A., and the contractor Mr. Gray Hill, of Coventry.

The Hon. Degree of D.C.L. has been conferred by the University of Durham upon Mr. Arthur Evans, the eminent archaeologist. The degree of D.Litt. has been conferred upon Mr. Owen Seaman, editor of *Punch*.

The Annual Meeting of the Wiltshire Archaeological Society has been held on Tuesday, Wednesday and Thursday under the presidency of Earl Pembroke. The opening ceremony took place in the library of Wilton House.

The Company of Makers of Playing Cards have awarded their prize of 15*l.* 15*s.* for the best design on the subject of "The Visit of the Prince and Princess of Wales to India, or their return to this country," to Mr. Leonard Marler, of Chailey Street, Lower Clapton. The H. D. Phillips Prize of 10*l.* 10*s.* has been won by Madame Renée Finch, Bath Road, Bedford Park.

The Architect.

THE WEEK.

BOROUGH engineers should take warning by the action of the Town Council of Dundee in dealing with Mr. WILLIAM MACKISON, who has held the appointment of burgh engineer during several years. We have already stated that Mr. MACKISON, in addition to his ordinary duties, has acted as Parliamentary engineer. Payment for the extra duties was evaded, and ultimately he was compelled to take proceedings to recover his fees. He also declined to act as Parliamentary engineer in the present session without extra remuneration. To do otherwise would be to raise a prejudice against himself in the law courts. The Town Council thereupon resolved to suspend him from his office of burgh engineer for four months. That period will soon come to an end. The Town Council have taken time by the forelock by moving that Mr. MACKISON should at once be dismissed, three months' salary being paid to him in lieu of notice. The grounds alleged were that the age of Mr. MACKISON prevented him rendering service to the Corporation, and in the interests of their constituents the Corporation were bound to act decisively. Mr. MACKISON, in a letter dated the 18th inst. to the town clerk, says:—"I am not aware of any instance where an official in my position, and after such services, has been treated in such a manner as I have been, and with so little consideration, and I would sincerely hope that the Council may yet think better of what they have done and reconsider their action towards me." It is alleged that during some years past Mr. MACKISON was unable to carry out his duties. Nevertheless, it is remarkable that he was allowed to continue to act as burgh engineer until the time arrived when for his own interests Mr. MACKISON was compelled to make an effort to recover the large sums due to him for special services. Local authorities commonly believe that with their assistants the privilege of serving the public should be its own reward. They are consequently never paid for many of the duties which they undertake. The fate of Mr. MACKISON, who has served Dundee both as architect and surveyor, should be enough to convince burgh surveyors or engineers that when they erect public buildings they stand a very remote chance of being rewarded for dispensing with an architect.

THOSE who imagine that the English shopkeeper will be satisfied by a restriction of his window space may receive some instruction from a recent case in the Southampton County Court. An old-established firm of drapers in that town sought to recover a sum of 111. from Mr. W. B. HILL, who is also long established as an architect in the same town. The amount in dispute was trifling, and should have been settled out of Court. But anything which may be supposed to interfere with a shop window is quite enough to bring dissension between friends. The plaintiffs wished to convert some dwelling-houses into shops, and Mr. HILL prepared the plans for the alterations. During the progress of the works it was found that the girders above the shop windows were placed 18 inches too low. As was to be expected, angry correspondence followed. Mr. HILL at once offered to have the necessary alterations made at his own expense, including the cost of raising the girders and the incidental work. The work was completed, and the architect gave the final certificate to the builder, including the cost of the alterations, the items being especially distinguished. The plaintiffs declined to pay that amount, saying the architect was responsible. The builder properly remarked that he had nothing to do with the dispute, and that he was to be paid the amount of the certificate. The architect said

the builder was to be paid, and the amount for the alterations could be deducted from his own account when he sent it in. The builder issued a writ, and it was on account of it the claim arose, viz. 31. 10s., the builder's costs, and 71. 10s., the plaintiff's costs. His Honour, Judge GYE, considered that Mr. HILL made a mistake in including the 851. cost of alterations, in his final certificate. He should have paid, and he was therefore liable in law for the consequences. The defendants' legal representative repudiated liability for any mistake connected with the girders, and asked for leave to appeal, but the Judge declined on the ground of the expensiveness of further proceedings. Evidently a shop window is as dear to the owner as his honour.

THE name of JOSEPH MARIE VIEN has been recalled to French amateurs because it is intended to demolish his old studio in connection with the works on the Boulevard Raspail. In England his name and works are unknown, yet he was a celebrity in his day. He competed with BOUCHER and FRAGONARD, and he was the master of DAVID. As far back as 1742 he won the Prix de Rome. On his return the Academicians were afraid of him, and it was owing to BOUCHER that he gained a position. One of the first appointments of LOUIS XVI. was that of VIEN as that of the director of the Academy at Rome, and during the ten years he held the office he introduced many reforms. Just before the outbreak of the Revolution he was made first painter to the king and honorary member of the Academy of Architecture. He contrived to keep alive when so many strong men were falling, and although he was eighty, he competed for a prize offered by the Republican Government, and won it. NAPOLEON took care to honour him as the regenerator of French art. The world no longer cares for pseudo-Classical pictures, and although VIEN was buried in the Panthéon, his countrymen have ceased to recognise him as one of their celebrities.

IF trade is to be carried on with people in the Colonies or in India it will be advantageous to have the law of agency more clearly defined than it is at present. It is rarely profitable, unless the business is on a very large scale, to send a representative from England to establish a branch house, although that is unquestionably the safest way of transacting business. The decisions in the Courts might be taken both for and against the principle of responsibility for what is done by agents. The latest decision, which was given on Saturday by Mr. Justice PHILLIMORE, related to work done for a rajah in India. Messrs. COWELL & SON, of Umballa, entered into a contract for erecting a palace. They had as representatives in London Messrs. RIVERS & Co., who gave orders to Messrs. H. H. MARTYN & Co., of Cheltenham, for decorative work. Sometimes the payments were made through the agents and sometimes were direct. On the failure of the agents, Messrs. MARTYN applied to Messrs. COWELL for payment of the balance of the account, amounting to 1091. Messrs. COWELL paid the balance to the trustees for the RIVERS estate on condition that the money was to be returned if the case was decided in their favour. Mr. Justice PHILLIMORE said that an English manufacturer was more likely to trust an English agent, but having regard to the correspondence and the evidence he came to the conclusion that there had been direct communication between Messrs. MARTYN and Messrs. COWELL, and a contract established between them. Judgment was entered for plaintiffs for 1091. with costs, but a stay of execution was granted. The conclusion to be drawn from the decision is that there is an advantage in an English trader momentarily setting aside the existence of an agent and communicating directly with his principal. From the Indian case it is evident that very little is required to prove a direct contract in that way.

THE STRENGTH OF BRICKWORK.

THE old builders were to be envied for their confidence in the strength of materials. Brick has been used from time immemorial, in Asia as in Europe. But we have nothing to suggest to us that builders made any elaborate investigations about the loads which it could safely sustain. There were, no doubt, traditional rules observed which probably were originally derived from failures. But their nature we cannot discover. We read of a Saracen in the ninth century introducing two brick piers instead of 300 columns in a mosque. However, it is now almost impossible to investigate the weight which came upon them. In subsequent times brickwork was employed in a manner that might be described as deceptive, for it was made to sustain pressure which was apparently borne by other materials, and in some cases the brickwork is more massive than appears at first sight. The plaster decoration concealed strength as well as weakness.

In several parts of Europe brick was largely favoured by the Mediæval builders, and the number of structures which have survived in excellent condition is a testimony to the care exercised in the construction. In masonry the dimensions of the stones which are available in a district may often lead to an excess of strength. In brickwork, on the contrary, there is a limit to the dimensions of the elements, and some rules must have been adopted to obtain the desired stability.

The English statesman who said that confidence was a plant of slow growth was expressing a truth which distinguishes modern modes of building from those of the ancients. Everywhere we see illustrations of doubt. Local authorities are sceptical about the knowledge or the honesty of architects and builders, and they fix on a series of dimensions which have to be adopted under a penalty. Not only in Europe, which might be supposed to be in a state of decline and required enactments for security, but in America courage in construction is restrained by rules. The consequence is that on both sides of the Atlantic there is a continued desire for experiments in order to ascertain whether there is the least variation in the strength of bricks and mortar. At first sight it may seem that experiments of the kind are a waste of labour, for the strength of brickwork was determined with sufficient accuracy fifty years ago. Nevertheless, there is a fascination in the inquiry which cannot be resisted although the results may be anticipated.

A few weeks ago when the Institute of Sanitary Engineers met at Manchester care was taken to include a paper on the strength of brickwork. It possessed, moreover, a local interest, for the experiments described by Mr. W. C. POPPLEWELL had been conducted in the testing laboratory of the Manchester School of Technology. The professors and students of that institution are fortunate in possessing a testing machine which is no model on a reduced scale like so many educational apparatus. It is a 900-ton hydraulic press with a 20-inch ram, and is supplemented by MARTENS'S mirror apparatus. When it is said that readings of deviations in size can be observed to $\frac{1}{10000}$ of an inch, and by estimation to $\frac{1}{20000}$ of an inch, it will be evident that the observations may be carried on to a degree surpassing the requirements of ordinary practice.

The bricks were arranged in piers with a square section of 18 inches by 18 inches. The work was done by ordinary bricklayers. Some piers were arranged on the lower platen of the machine, others on stiff squares of timber. The precaution was taken to have the top and bottom surfaces set in neat Portland cement or in plaster of Paris, in order that the load would be uniformly distributed. The variety of bricks comprised common local wire-cut bricks with lime mortar and with Portland cement mortar; Accrington bricks with black mortar; blue Staffordshire with Portland cement mortar; blue brindle Staffordshire with black

lime mortar, Portland cement mortar, lias lime mortar; Accrington bricks with Portland cement 1 to 1, 2 to 1, 3 to 1, 4 to 1, 5 to 1.

We sometimes see bricks which are more or less cracked but which continue to do duty as parts of a wall. They are unsightly, and if they could be easily removed few people would care to retain them. With iron and steel, and to some extent with timber, it is possible to load them heavily without any dangerous result being visible to the naked eye. Some authorities believe that the continued application of a heavy load to steel or iron, although it may not exceed the limits of safety, has a deteriorating effect upon the material. How far does brickwork correspond with metals? Mr. POPPLEWELL tells us that an increase of compression can be indicated by the MARTENS'S apparatus and shows the end of the elastic condition. According to him:—"What is happening in the material after this point is passed is not very clear, but it may be thought probable that the particles, which up to this point have retained nearly the same relative positions, are being pushed further out of their places and a sliding movement is beginning to take place. It is very likely that this movement takes place first in the mortar, and when this begins to move and fail the even distribution of the stress on the bricks themselves must be changed, with the result that these begin to crack, and a general movement begins to take place throughout the brickwork." He believes that the result of excessive applications of the load is very like "what is found to take place in similar experiments upon some of the metals." This would suggest that there is more homogeneity in bricks than is commonly assumed, and that a general law of uniformity, although differing in degree, applies to all varieties of inorganic substances derived from the earth's surface.

The strength of bricks is insufficient to determine the strength of brickwork. We might say that the principal factor is the mortar, which fortunately can be increased in strength with greater ease than the bricks. Mr. POPPLEWELL took particular care to ascertain the effect of mortar in brick piers. Five were erected of similar bricks. It was found that three which were tested were crushed under a load of 388 tons per square foot. With a mortar composed of sand and cement in different proportions the crushing load varied from 116 tons to 159 tons per square foot. The first crack varied under loads from 69 to 97 tons. Mr. POPPLEWELL says the crushing or collapsing load is always found to be uncertain, but the first crack marks the point when internal movement is commencing. There is less uniformity in the results than is commonly found in dealing with iron and steel. It is evident, however, that with bad mortar cracking begins under far less loads than with Portland cement or the black lime which is sometimes used in the North. Blue brindle Staffordshire bricks, when there was a deficiency of lime in the mortar, began to crack under a load of 38 tons and 41 tons. But with black lime there was no cracking until the load reached 100 tons; and with 3 to 1 Portland cement the cracking load was 132 tons and the crushing load 169 tons.

It cannot be expected that architects and builders will remember a whole series of experiments. General results are of greater use. Mr. POPPLEWELL approves of safe loads of 5 tons per square foot with ordinary brick and lime mortar and average workmanship, 8 tons with good workmanship, and 10 tons for best brickwork in cement. "A case," he says, "is quoted of a chimney in Glasgow where the stress is 9 tons per square foot in still weather, and as much as 15 on the lee side in a gale of wind. In the light of the results quoted here it would appear that the loads usually applied to brickwork are amply safe in most cases." The rules generally adopted being satisfactory, there would seem to be no necessity for additional experiments. We may, however, expect that investigations will be continued, although they may not lead to

any novel results. In a sceptical age it is, however, satisfactory to have the fact which is palpable of the endurance of English brickwork confirmed not by reason but by the demonstration of a machine.

STUDENTS' DRAWINGS.

THE School of Architecture of the University of Liverpool has started a good work, both for the students of the school and architects, by issuing a collection of measured drawings. Professor C. H. REILLY describes in his preface the objects aimed at, which runs as follows :—

During the last two years a set of measured drawings of some approved building, together with a thesis on it and similar work, has been required from students proceeding to a bachelor's degree in arts in the Honours School of Architecture. In this way the majority of drawings here reproduced have come into existence. I am convinced that there is no better exercise for the student of architecture than in the dissection and reconstruction of the work of the masters, by careful and complete measurements taken on the spot from the buildings themselves. Only so does every subtlety in the design become apparent as the mind of the original artist gradually unfolds itself to that of the student. The work has generally been undertaken in the long vacation, at the end of the student's second academical year. When it is remembered how small a place drawing takes in the curriculum of an ordinary public school, excuse will be made for any deficiencies in draughtsmanship. I am satisfied, however, from a careful study of the surveys and measurements taken that the drawings, as far as they go, represent a truthful and complete analysis of the work portrayed. I hope therefore they may prove of value not only to the architect, who in these matters must always be a student, but also to the general public as a permanent historical record of notable works of art. This is the sole reason for their publication. It is proposed, if it proves possible, to issue such a volume as this yearly, or at somewhat longer intervals. In time, and especially since the recent enrichment of the School of Architecture with a valuable travelling studentship, a large and comprehensive list of buildings should be included.

There are many opportunities already offered to architectural students for the preparation of measured drawings. But generally the choice of subject is left to each individual. As a rule the majority of collections are of a varied character, as if dictated by chance. With drawings like those from the Liverpool school we expect that a definite programme will be followed, and that all the subjects will bear more or less relationship between them. With the exception of two drawings of the Petit Trianon and the Grand Trianon the subjects are English. There is a Jacobean chimneypiece from the Bolton Museum. But the great proportion of the drawings represent Late Renaissance. The subjects are :—The Town Hall, Liverpool; the Custom House, Dublin; the Orangery, Kensington Palace; the Senate House, Cambridge; the House of Providence, Dingle Lane, Liverpool; and Doorways of St. George's Hall, Liverpool. There are thirty-one plates. Whatever may be the disadvantages of the style selected as compared with Gothic, it has at least the merit of allowing the drawings to be made with bold and definite lines. The general views are shown by means of photographs. The Town Hall, Liverpool, designed by JOHN WOOD, of Bath, was completed in 1754. But the cupola is the work of another architect. The sculptured details are the least satisfactory. The figure of Britannia which surmounts the structure is much admired in Liverpool; it is in terra-cotta and of Italian workmanship. The drawings are by Mr. A. C. FARMER and H. MCG. WOOD. The two Trianons are drawn by MESSRS. LYON. GABRIEL designed one building and J. H. MANSARD the other. The Custom House, Dublin, of which the drawings are by Mr. H. H. HILL, would be worthy of standing on the Grand Canal at Venice instead of on the Liffey. JAMES

GANDON was the architect, and although he was the first gold medallist of the Academy, and appeared to be destined for success in England, he preferred to live in Dublin. In his time sailing vessels were moored in front of the building or passed in front of it. Now the Liffey is spoiled in the vicinity of the Custom House by a pair of commonplace girder bridges. It is strange that the northern façade is never photographed or drawn. WREN's Orangery at Kensington Palace charmed people by its adaptation as the British offices in the St. Louis Exhibition. The simplicity of the treatment contrasted with the grandiose structures near it. It is carefully drawn by Mr. H. THORNTON. The Senate House, Cambridge, is usually ascribed to GIBBS. But it is difficult to ascertain what part an amateur architect has had in the design. Mr. F. THORP is the draughtsman. It is well to revive an interest in DECIMUS BURTON, who in 1824 designed the House of Providence, Liverpool. It is a type of the Classic which was then in vogue. The two plates were measured and drawn by Mr. H. MCG. WOOD. St. George's Hall, Liverpool, should be fascinating to all architectural students, for it was designed by H. L. ELMES, who at the time he won the competition was only twenty-two, and had to compete with eighty-five rivals. The drawings are by Mr. M. RAVENSCROFT and Mr. W. N. ADAMS, and represent details. The drawings of the Jacobean fireplace are made by Mr. D. A. CAMPBELL. The plates can have use for others besides architectural students. The agents for the book are MESSRS. CROSBY LOCKWOOD & SON.

IRON IN IRELAND.

IT is saddening to find an account of the iron trade in Ireland in an archæological journal. Yet no place is, unfortunately, better adapted to contain the information. Iron ores have been exported from the North of Ireland in order to be worked in England or Scotland. But iron in any form is not now produced throughout Ireland, although there are several districts in which the ore abounds.

We need not say how close is the connection between iron and other industries. Few as are the manufactures in Ireland, the use of iron in some or other of them is imperative. But the material has to be imported from other countries, and in that way, as in several others, Ireland seems to be doomed to fill only a dependent position.

The paper to which we refer is contributed to the Journal of the Royal Society of Antiquaries of Ireland by the Rev. JOSEPH MEEHAN, who lives in the Lough Allen, or Arigna district, which is probably the richest in minerals of any part of the island. It is believed to be providential that in some of the iron districts of England the coal for working is found contiguous. It is so in Arigna. At the present time bituminous coal, not unlike that found at Liège in Belgium, is yielded, and about 12,000 tons yearly have been sold. But not a caldron of it is employed in operations with the iron. Yet the formation is so rich that the highest part of the district is known as "Slieve-ou-Ierin," or in plain English, the mountain of iron. When the Arigna ironworks were busiest—and there is no question that excellent pig-iron was made there—timber alone was employed. The neighbouring woods were gradually cut down to supply fuel. But there was no thought of the future, and planting was neglected. We must not be too severe upon the Leitrim ironworkers. When the supply of timber was prohibited in Sussex, the iron industry, which was in a prosperous state, quickly failed.

It was not until the beginning of the seventeenth century, as everyone knows, that Lord DUDLEY employed coal instead of wood fuel. After his death there was a decline until DERBY discovered a process which he used at Coalbrookdale, and it was not until

1750 that coke was substituted for coal, when the production of iron became more easy and profitable.

It suggests the peculiar connection which existed between Ireland and France that the use of coke was derived not from English but from French experience. That would appear to be about 1788. Although the process of smelting was likely to have been imperfect, yet the ore was so excellent that the pig-iron of Drumshambo quickly gained a reputation. The same ore can still be found both at Arigna and at Creevelea.

In connection with the history of iron in the county Leitrim we can see an example of the old jealousy by which trades became mysteries. Mr. MEEHAN relates the following:—

Sir Charles Coote is recorded to have carried on iron mining and smelting both in the Arigna valley and at Creevelea, county Leitrim, the most northern extremity of the Connaught coal-fields, in the beginning of the seventeenth century. At the foundries attached ordnance was cast. Hence, anxious to hide from the Irish the secrets of the process, he employed only English and Dutch. Indeed, he is said to have engaged at one time in his different ironworks throughout Ireland as many as 2,500 or 2,600 of these foreigners. The reason assigned by Boate for this exclusion of the Irish is not the one just adduced, but because, according to him, the natives were then considered the most barbarous natives of the whole earth, and "as having no skill in any of these things." That country is to be pitied whose history is written by an enemy. The Creevelea and Arigna ironworks were burnt down by the insurgents in 1641. They were "broke down and quite demolished," Boate says of them. They were restarted in the eighteenth century.

At the beginning of the nineteenth century it is supposed there were 200 people employed at the ironworks, which were known as bloomeries. The furnaces are now absent not only from Leitrim, but from all the other districts of Ireland. In some cases where works existed their positions cannot be identified. There was a tramway in use at Arigna consisting of two metal rails, which were cast on the spot, on which a lorry with flanged metal wheels used to run.

Fireclay of excellent quality was to be found in the Leitrim coal-field. It was used for the firebricks of which the high furnaces were constructed. About thirty years ago a company was established for the production of firebricks, which were found to be suited for the works of the gas company, the breweries and distilleries of Dublin. But like other enterprises in Ireland the operations suddenly came to an end. The spectacle is consequently presented in Leitrim of a vast quantity of iron ore, fireclay and other materials, and now serving no other purpose except to point a moral and form a subject for an archæological essay.

The essay would, we suppose, have remained unwritten if it were not for a desire to draw attention to a cast-iron panel which was found built into a cottage wall at Arigna. It measures 2 feet 5 inches by 1 foot 10 inches. Within a square frame are represented two dubious animals which are supposed to represent a cat and a lion—the emblems of the family of O'ROURKE. Beneath is the date 1688. According to tradition it was cast on Furnace Hill, near the town of Drumshambo. It is not put forth as a remarkable example either of heraldry or of art. The Sussex moulders of fire-backs would be likely to value the Irish casting at a very low rate. But it raises the question whether it was an unique example of Drumshambo art or whether somewhat similar castings were not in fashion. One or two others relating to another family are known to exist.

The year 1688 marks the close of an era. An ancient family like the O'ROURKES would be proud to have their existence acknowledged. But the flight of JAMES II. was succeeded by grave events. After the surrender of Limerick those alone who were faithful to England could enjoy peace in the country. But as

MACAULAY said of the other party, "the iron had entered into the soul." The memory of past defeats, the habit of daily enduring insult and oppression had cowed the spirit of the unhappy nation." We may then doubt whether such a tablet, unless as a monument, could have been produced even in so remote a district as Leitrim. From the circumstance that the lettering is confined to "O" and "R," it would seem as if the founder did not wish to have the subject of the memorial identified.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THIS Association held on the 7th inst. its annual excursion, when the members visited Tulliallan and Culross. The party, which numbered upwards of fifty, was met and welcomed by Sir Jas. Sivewright at Tulliallan and shown by him over the modern castle and gardens. The party then proceeded to the old castle, where Mr. Harold O. Tarbolton read a short paper. After inspecting the castle the members were entertained to luncheon by Sir Jas. Sivewright in the old banquetting-hall. At the conclusion of the luncheon Sir James gave the toast of the Association, to which Mr. H. O. Tarbolton, president, replied and thanked Sir James for his hospitality. Thereafter the party drove to Culross, where they visited the palace by permission of Miss Luke, and the abbey church and the abbey house by permission of the Rev. David Hampton and Lord Bruce respectively. In the absence of Sir R. Rowand Anderson, Mr. A. F. Balfour Paul, architect, acted as leader at the palace and abbey.

MODEL DWELLINGS.

AT the meeting of the Institute of Sanitary Engineers in Manchester Mr. H. Allan-Scott opened a discussion on the housing of the working classes. He appealed for further consideration of the question of the advantages and disadvantages of block dwellings and cottage tenements, more particularly for towns. The so-called "model dwellings," he said, were most undesirable. Why, he asked, should block dwellings be built when there were hundreds of acres to sell freehold at 500l. an acre within eight miles from the Marble Arch—and if that was so in London, other large centres must be more fortunate)—places served by at least three railways with good train service and very cheap workmen's tickets? The Acts of Parliament allowed the authorities to build outside their own districts, and yet they continued to build "model" block dwellings in the heart of confined and unhealthy districts, providing no gardens, but providing miserable playgrounds 40 feet wide. Upon calculations he had made, Mr. Scott said no financial difficulty need arise in the provision of a housing scheme within the distance from a town he had named. There was no doubt that the present system of block dwellings was most unsatisfactory, both from a physical and mental point of view, whereas the idea of providing small cottages with a plot of garden attached to each was an excellent one which ought to appeal to the mind of everyone. It seemed false economy to erect block dwellings which only served as a breeding-ground for disease to supply the sanatoria which were being built at enormous cost. He urged members of the Association to visit the Blackley estate of the Manchester Corporation. It was, he said, particularly satisfying to observe that the elevations had had consideration. But there appeared to be no proper ventilation to food cupboards. He sincerely hoped that block dwellings were things of the past. They could be conveniently converted into good warehouses, and no money need then be wasted.

The chairman (Sir William Mather) said many efforts had been made by philanthropic societies and municipal bodies to solve the housing question by the erection of solid piles of buildings which looked more like workhouses than dwellings in various parts of the country. He was glad to think that the public mind, as well as the sanitary and the æsthetic mind, was against the idea of block dwellings, and that cottage tenements were becoming the most favoured form in which the housing problem might be solved. The garden city movement also had taken hold of the imagination, and had received the financial support of the English people, and was solving for us some very difficult questions. There could be no doubt that during the next generation we should certainly find our country and our towns far better arranged for purposes of the comfort, health and decency of the masses of our people than they were at present.

INTERNATIONAL CONGRESS OF ARCHITECTS

Thursday, July 19.

Dr. Ing. H. J. Stübgen (Germany) and Sir Aston Webb, R.A., acted as chairmen at the Grafton Galleries on Thursday morning, when papers were read on "The Education of the Public in Architecture." The secretaries were M. A. G. Bzn Salm (Holland) and Mr. W. M. Mitchell (Ireland).

THE EDUCATION OF THE PUBLIC IN ARCHITECTURE.

By JOHN BELCHER, A.R.A.

THE first step, as so often is the case, will be for the public to unlearn much that has been wrongly learnt. The superstitions of antiquity and the "styles" must be exploded. It must be made plain that neither a smattering of archæology nor a superficial study of styles affords a sound basis for a critical judgment in matters of present-day architecture, which must be presented to the eyes and ears of men as a living art, founded upon past achievements, it is true, but instinct with a power and vitality of its own.

Neither is architecture merely a matter of a beautiful exterior; the importance of the "plan" of a building and of sound principles of construction must be pressed home. In other words, architecture is a science as well as an art—a blending of the two in such a way that the practical knowledge of the builder or engineer is interpenetrated by the artistic spirit, and made without prejudice or loss to subserve its ideals.

Instruction of a positive order will range itself under the three heads of principles, qualities and factors. The principles of architecture are two, truth and beauty. Truth requires that a building, both in its entirety and in its several parts, should never seem to be other than what it really is. This excludes all pretence of antiquity where no such claim exists. It requires that a church should look like a church, a town hall like a town hall, and a private residence like a private residence. An external shell of plaster over brick must not present the appearance of blocks of stone, nor a steel structure cased by terra-cotta suggest solid masonry. Good architecture never deceives the eye even for a moment. There must be no false suggestion as to the purpose or construction of the building, nor any hiding under one external feature that which is usually expressed by another. The principle of truth, however, finds its widest scope in the true use of materials. Every material has essential characteristics of its own, and therefore a proper place and purpose in building. There is a time and a use for stone and for each kind of stone, for wood and, for each kind of wood, and so on. To defy, neglect or misuse the natural qualities of materials is not good architecture. These natural qualities will be roughly indicated under the head of "Factors."

Beauty is the second great architectural principle. Its elements do not admit of popular exposition, but the public may be trained to recognise its presence by the appeal that it makes to their imagination and emotions. The fact that beauty can be felt but not (ordinarily) analysed is of importance in the education of the public, as tending to withdraw their attention from mechanical rules to the spirit that animates and pervades like a living thing the highest architecture. An appreciation of beauty of form is less common than susceptibility to colour effects, and needs training and development. The qualities that distinguish good work from bad may be classed as follows:—

Strength.—It is not sufficient that a building be, in fact, strong and secure; it must look so—it must satisfy the eye. The engineer may by exact mathematical calculation know that the conditions of security are amply fulfilled, but the architect has to see to it that the work presents an appearance of strength and solidity. The larger and heavier parts must be below; every arch must have sufficient abutment or even a tie-rod as well; solids when placed over voids must be strongly supported, and so on. Methods of support and resistance must be clear and well defined. Granite in the upper storey of a half-timbered house may, as a matter of fact, be quite safe, but it seems to threaten danger; placed below it satisfies the eye with its impression of solidity.

Vitality.—Evidence of life and growth, most plainly illustrated in Gothic work, where the perpendicular lines rising heavenward and clothed, as it were, with luxuriant

ornament, suggest the life of a tree or plant. It is vitality that gives ever fresh combinations and effects from the same primary elements.

Restraint.—The limitation of means to an end, the suppression of all unnecessary parts or details. Whatever be the nature of the building, there should be purpose, definite purpose, in every feature or ornament. This may be illustrated under the head of "Proportional Divisions" (see "Factors"), but the general principle is one which will be readily grasped by the intelligent layman, to whom it will often suggest a line for thought and inquiry.

Refinement is impossible without restraint, but it includes also purity of form and perfection of material. Everything must not only be the best of its kind, but so suited to its purpose that nature will seem to have expressly designed it for that use and place. The fitness of certain materials and forms for defined purposes and effects is subject-matter for an important chapter in the education of the public.

Repose.—Every really good work is clothed, as it were, in an atmosphere of repose. There is a sense of power, but it is latent power; there is evidence of vitality, but it is restrained vitality. Effects too pronounced hurt the eye; ornament too profuse wearies both the eye and the emotions. There must be no "loud" or vulgar elements.

Grace.—A dignified seriousness of purpose should be observed in the appearance of all public buildings, but an expression of the graceful courtesies of life should not be lacking. In domestic buildings this element of grace takes a more prominent place and assumes a higher and more refined form, corresponding to the tender sentiments of home life. The public interest ought to be readily roused in this direction and a demand created for a better class of small suburban residences.

Breadth.—The treatment of the subject as a whole in a simple grand manner, the proper massing of the several parts, the subordination of detail to the larger forms of the composition and to the bringing of the whole design into unity. An attempt may be made by illustration and comparison to explain this somewhat technical term, that the public generally may be led to understand and appreciate this quality of breadth which is so conspicuous in every great architectural work.

Scale.—The right relation of the several parts to one another and to the whole in point of size. It will be pointed out that there are different scales in architecture as in music, and that the varying effects upon the mind and heart are as powerful and distinct in the one case as in the other. Also that the scale should be appropriate to the character and purpose of the building. A building of a monumental character or of great public importance should be designed and built on a large scale, and each part and every moulding should be of a proportionate size.

Factors.—In dealing with factors—the means which the architect has to his hand, as it were, for the attainment of his ends—it will be necessary to emphasise the fact that most, if not all, of these factors have their origin in utility and answer some practical need in the construction or preservation of the building. To forget this primary purpose and use them as means of artistic embellishment is to sacrifice use and convenience to artistic ideals, and is not true architecture. The public are quick to recognise the importance of this in respect of window and door openings, floor divisions, chimneys, &c., but are apt to think of columns, pilasters, sills, hood-mouldings, cornices and perhaps even buttresses as decorative rather than useful, and to suppose that the architect has a free hand in the disposition of them. Education in this matter will include instruction in the primary use of purpose of the common architectural forms, and will give an insight into the difficulty of making these forms serve the ends of use and beauty at one and the same time. Such an insight—like propounding a problem—will go far to quicken interest. The subject may be dealt with under the four heads of Proportion, Light and Shade, Solids and Voids, Balance and Symmetry:—

Proportion.—Certain proportions are pleasing to the eye, and effects of proportion are obtained by the relative size of different parts. The various ways in which the constructional parts and features of a building may be utilised to obtain proportional divisions, both horizontal and perpendicular, might be described in detail.

Light and Shade.—The advantage that may be taken of effects of light and shade might also be pointed out.

Solids and Voids.—The importance of a right adjustment of solids and voids, both in respect of size and position, would come next. How easily a false scale may be set up and a building made to look insignificant by broad sheets of plate-glass in the windows.

Balance and Symmetry.—These give a very distinctive character to a building and aid in setting forth its special purpose. There is or can be rhythm in architecture as in verse.

Material.—The right use of the various kinds of material furnishes an interesting and useful subject for public instruction. The general principle having been laid down that every kind of material has its special characteristics and should be treated accordingly—in other words, that its very best should be got out of it—a brief account of the natural qualities of the chief building materials (stone, wood, metal, bricks, plaster, &c.) would follow.

The following leading thoughts are appended by way of illustration:—

When stone and brick are used in conjunction the former should be accorded the more honourable parts—*e.g.* quoins, architraves to doors and windows, sills, cornices, &c. Granite, even if it could be carved for mouldings, should be used rather for strength and solidity than for ornamental features. When the beauty of marble or wood is in its figure or colour, it is best exhibited in the form of slabs or panels; if moulded the forms should be large. Stone is granular, wood fibrous: each has its appropriate forms and mouldings suggested by the natural qualities of the material. Wrought metal admits of the finer and more delicate forms, metal cast in moulds naturally assuming a more bulbous shape. Both kinds have their appropriate place and effective use. Well-known examples of wrought-iron and cast-iron gates and railings afford interesting illustrations.

The foregoing summary indicates the main lines along which the education of the public in matters architectural should be developed. Whether in public lectures or in articles published in book form illustrations should be abundant. There are signs of a wave of public interest in architecture which "taken at the flood" may become permanent and lead to great results.

By DR. ING. HERMANN MUTHESIUS (Berlin).

It is an undeniable fact that architecture is unpopular—probably the most unpopular of the arts. This is especially evident by comparison with the enormous interest which the public take in works of painting and graphic arts. But it seems doubtful whether any so-called education of the public in architecture will get at the root of this problem. The present low level of understanding and interest is probably to be considered as a proof of the fact that in our days architecture itself has lost much of its public importance and value.

This becomes obvious if we contrast the architecture of our day with that of the great epochs of the past, the Greek, Roman, Mediæval. Architecture was then the leader of all the arts and crafts. And this was so because it was the universal art, and had to deal with all the constructive and building problems of the time.

In our days the problems of the engineers, whether connected with the perfection of systems of locomotion, of comfort, of labour-saving machinery, or of tools and instruments, play a more important part than the works of architects, who only in laying-out of streets and cities touch the great contemporary problems. The engineer is compelled to look to the future, and in consequence he is generally unfettered by minor considerations. Whereas an architect, hampered by historical tradition, looks backward and makes his works appear rather works of a past age than of the present day.

The history of architecture of the nineteenth century shows a remarkable lapse into archæological fashions of various and often contradictory kinds, so that true architecture almost died out, and as a result the architect's work became a mere application of details of historical styles. Even the architecture of the present day is largely ruled by archæological principles. This is shown (a) by the importance still attached to style (we build Romanesque exhibition halls, Renaissance railway stations, &c.); (b) by the attitude still preserved by a great number of architects towards our old buildings, which are being restored by them in the so-called spirit of a past age; (c) by the endeavour frequently met with to conserve the character of an old street or square by putting imitations of old buildings next door to the originals. Moreover, the fact

that contemporary architecture is enslaved by these archæological tendencies has in several cases aroused the opposition of the well-educated sections of the public against architects. On the other hand, it is to be noticed that architects of marked originality, who create modern rather than archæological works, have found support, and even aroused enthusiasm, amongst the less educated public. Every country furnishes instances. This enthusiasm springs from the same source as the present enthusiasm for the modern tendencies in decorative arts. The reason in both cases is a conviction that such architecture has found the bases of modern feeling, and that the archæological masquerade is over.

The intrusion of archæology into the art of building has been the ruin of architecture during the last few centuries. Archæology, however high it may be as a science, has nothing to do with living art, and ought to be strictly separated from it. Owing to archæology the public has been miseducated, for it aroused that deplorable interest in styles which now proves to be the greatest of all hindrances to instilling the true principles of architecture. Those architects who still work in the styles foster this fatal state of things, and through their connivance with the public render it more and more difficult to lead them away from such errors.

If the public is to be educated in architecture it can only be done through architects' works showing a genuine modern feeling and being impressive through their personal merits, and not by their resemblance to works of past ages. Such works are, unfortunately, exceedingly rare in contemporary architecture. The best way of educating the public is to produce more of these and to leave styles alone. The so-called education of the public requires therefore in the first instance the education of architects. So much on the principles of the subject: the following remarks refer rather to details.

The inclusion of architecture in the annual art exhibitions has not proved a success. The architectural room is generally empty. A better scheme would be to exhibit models instead of drawings, as models can alone give an idea of the stereometric effect of a building. Moreover, they are attractive in themselves. Architectural drawings, even if perspectives, at most arouse interest as graphic works, and are then very often at disadvantage with the works of graphic art shown in the adjoining rooms.

A very powerful means of education is literature, for by reading alone can the major part of the public be influenced. However, there is small hope of properly utilising it if, as at present, good information on architecture is given solely in professional papers. These journals are not in touch with the public, which acquires its knowledge from the daily Press and magazines. Hence it is very essential that trustworthy information should appear in the latter. But, unfortunately, the usual writers for papers and magazines are incapable of imparting such information on architecture, for they are laymen. It is therefore necessary that competent technical writers, who now practically limit themselves to the professional journals, should turn their attention to newspapers and magazines.

In addition to the information in the Press, lectures, if given by competent men, are an excellent means of educating the public. Architectural societies should make it their duty to induce universities and other educational bodies to arrange for lectures on the subject. Nevertheless, all efforts to impart education by word or writing are useless if they are not inspired by a modern spirit, if they are employed by any other but thoroughly competent men, and if they are not reinforced by works of genuine modern character. Though it seems quite safe ground to base art education on works of past ages, it is a universal experience that by the superficiality of such instruction a mere romantic interest is aroused, which is worse than useless. Moreover, there is plenty of opportunity for education in the historic arts. What is wanted is to arouse interest in the architecture of the day. An education such as is necessary for the problems of our time can only be effected by genuine works of our time.

By T. G. JACKSON, R.A.

Archæological study of architecture, moreover, only touches one side of it—the outside features of bygone styles, not their inner reasonableness. All styles in the past have been based on natural and social reasons, and mainly on construction, and their general form and features are such as have been suggested thereby and are expressive

of it. So long as we think the essence of a style consists in its outward features we shall fail to understand the true nature of it. This, however, is the case to-day. Architecture, whether ancient or modern, must be called upon to explain itself and give a reason for its design, and be judged by that, instead of by mere conformity to precedent. One effect of the false view of the subject is to teach that architecture is ornament applied to building. A fatal fallacy. After all, the best means of education is by the production of well-designed buildings, architects the best teachers, and real work more edifying than books or lectures.

By BANISTER F. FLETCHER.

Why is architecture, the petrified history of the past, not generally included in educational schemes?

Its absence is probably due to its technical nature. Its importance as a general subject has not been realised, though it is inseparable from the progressive history of every civilised nation. The subject must be illustrated, for without views and plans it is akin to a play which is read instead of being witnessed on the stage.

The use of photography in conjunction with lantern slides nowadays enables a lecturer to fully illustrate any period of architecture. The technicalities are simpler than in most scientific subjects. It can easily be invested with human interest and made intelligible to the ordinary student.

Architecture, as the work of human hands, is the result of brain power or thought, and is therefore more worthy of inclusion in a general education than a score of subjects which have secured recognition and protection. A study of architecture enables us to interpret the moral, artistic and religious character of humanity, and a knowledge of the profoundest characteristics of a nation may be gleaned from a study of its buildings.

It might be expected that our older universities, such as Oxford and Cambridge, would welcome the study of an art which is so bound up with humanity of all ages, and would provide for a special faculty to advance the general study of architecture, apart from its adoption as a profession.

Its inclusion would be far-reaching, and many benefits would be derived by the public, who would thus be enabled more fully to appreciate the works of art which are to be found in the highways and byways of every land, and which serve as free galleries of art.

Further, the study of architecture is necessary to a complete understanding of history, and gives an added interest to travel.

Bishop Creighton defined architecture as the most democratic of all arts, and pointed out how it is equally for everybody—rich and poor alike. History has been to architecture what steam is to machinery, the grand propelling power; and it may well be described as the printing press of all periods. It calls into action so many branches of mechanical labour which promote national prosperity that it is therefore more entitled to the attention of the general student than any other of the fine arts, a further reason why the general community should acquire a taste for it.

As the art which shelters us from the elements, and with which we come in daily contact—as the art which gives us “home” and enshrines and illuminates the most sacred of our associations—and, lastly, as the mother of all the arts, architecture is certainly worthy to be included in the curriculum of a general education.

ALBERT KELSEY (United States).

Judging by results the education of the public to an appreciation of architecture in the United States is a matter of more than theoretical importance. It is an accomplished fact. The Chicago and Buffalo World's Fairs, and the Dewey arch and its approaches, executed in “staff” also, were real object lessons on a large and lavish scale, which have done more for the public than all the lectures and books written to capture its attention. Architecture as a fine art is only a product of recent years in the United States, but the prodigal public is now patronising architecture on a scale comparable with the great and lavish commissions of the Doges when Venice was at the height of her glory. Nowhere are costly materials and rare marbles used so lavishly as in the United States, and nowhere are the opportunities of the architect so promising.

The T-Square Club delegate to the Brussels International

Congress of Architects said among other things that although they had faultless copies in the United States of the most famous European buildings, the one thing they did not possess was a national, indigenous style typical of the present day. That was nine years ago, and Americans are still impatient. Since then twentieth-century life has created twentieth-century problems. Since then architecture has passed through the experimental stage, and is now recognised as one of the learned professions. This fortunate state of affairs has been brought about primarily by the creation of an educational system which stretches from the Atlantic to the Pacific. It is now possible for any talented and ambitious draughtsman (either college or office trained) to procure the advantages of foreign travel as well as a course at the Ecole des Beaux-Arts without cost to himself. Moreover, a complimentary arrangement has even been made by the French Government whereby the winner of the Paris prize in the final competition of the New York Beaux-Arts Society is admitted to the first class upon his arrival in Paris, thus eliminating an exacting entrance examination and all the work of the lower class required of other architectural students at the French National School of Fine Arts.

It is noteworthy that, of the fifteen scattered ateliers allied to the New York Beaux-Arts Society, the work of the T-Square Club atelier ranked first during the past year. The educational system, however, is not alone responsible for progress and prosperity. American architects have had unusually lavish opportunities to build; and, lastly, their endeavours have been loyally seconded by an architectural Press which has done much to raise standards and to diffuse knowledge.

An indication of American architectural progress may be obtained in the report of the international jury on designs submitted in The Hague Peace Palace competition. Of the design from the United States which received an award it was said that the exterior was greatly to be praised both for simplicity and suitability of character, and the interior was well studied and distinguished from most of the others by a notable economy of space.

“Standing-room only” is a common saying among the architects and real estate men of the narrow island of Manhattan; hence the buildings stand close and high. A stable with 300 stalls and a great bright riding ring on the sixth floor is one of the results. Another is the Hotel Belmont, a twenty-eight storey structure. It has sixteen high-speed elevators and a subterranean mechanical plant filled with engines, boilers, dynamos, electric-lighting machinery, refrigerating, ventilating and cooling devices, enormous filters (beside air filters or washers for the heating system), fire pumps, elevator machinery, a vacuum cleaning device extending to every room (which sucks dust and dirt and refuse back to a crematory where, with the garbage from the kitchens, &c., all is consumed). Then there are three additional underground storeys, one of which is used for a railway station. This is enough to give an idea of the modern problems, and to suggest the organising genius necessary to carry them out. Most of the apartments are above the fly level, the dirt level and the noise level. Nearly every bedroom has its private bath-room. From every room the guest gives his orders by telephone or by teleautograph—a system which transmits orders in his own handwriting.

Another bewildering example, in which the full meaning of “standing-room only” is brought out clearly, will be seen in a terminal station in which batteries of boilers and a monster mechanical plant will be concealed up and back of the main cornice, 100 feet above the street. And yet, notwithstanding these intricate requirements, architecture as a fine art advances with great strides. Americans have been building beautifully, if not always appropriately, and now the domestication or nationalisation of their architecture is the next problem. The florid pretzel and oyster ornament so common on the inferior new buildings of Paris—and its architectural suburb, New York—is a manifestation of ignorance which is being combated, many contending that in a search for indigenous sources of inspiration their traditions lead to England rather than to France.

Thus, in the United States more than anywhere else, architects are entitled, both on account of diverse historical associations and because of the constantly increasing mixed population, to come to a reunion such as the International Congress prepared to learn something from every delegate that may be turned to appropriate and practical use. Naturally their thoughts turn first to the Mother Country, and with gratitude to the Royal Institute of

British Architects for the magnificent entertainments and for the many expressions of cordial goodwill. But there is nothing limited or special in such endeavours. Americans are studying the great architectural on-sweep of the world, endeavouring to assimilate, from here, there and everywhere, anything that will add to the dignity and glory of architecture. But they are not altogether selfish; on the contrary, the delegate of the architectural societies of Philadelphia emphasised this point: they are ready and willing to give as good as they take. They fully recognise how vitally and intimately related their work is to the work of other nations, and recognise the manifold advantages to be derived from an international *entente cordiale*, and in consequence they propose to do all in their power to strengthen, fortify and buttress these fraternal ties.

By FRANCISCO DEL VILLAR Y CARMONA, MANUEL VEGA Y MARCH and EDUARDO MERCADER Y SACANELLA (Spain).

The want of architectonic education among the masses of the public is everywhere a general fact. Owing to local circumstances and to the various shades of the phenomenon it is generally attributed to different causes; there is in reality, however, but one, and this is the most pitiful ignorance of what constitutes and characterises our art.

The reality and importance of the subject are of course evident, as well as the necessity for affording concrete solutions that may modify the actual state of things for the benefit of the public, whose education will increase; of architects, whose status will improve in proportion as their efforts are duly appreciated; of art, by means of which it will insure the respect of everybody, and will henceforward be free from sacrilegious attacks by the ignorant masses.

We recommend the adoption of the following means:—

1. All Governments should order to be placed in every primary school photographs or drawings showing the classical works of all kinds of specimens of architecture, with an indication of its style and epoch.
2. The teaching of æsthetics and of the history and theory of the fine arts should be included in the general curriculum of schools.
3. Schools of every kind should be compelled to teach elementary architecture.
4. All countries should promote permanent exhibitions of architectonic works, conveniently classified, represented by drawings or photographs or models, and illustrated with short descriptive explanations.
5. Governments should encourage all kinds of publications for the divulgation of art, instituting for the purpose rewards and bounties. They should also purchase a considerable number of them for distribution among all public libraries, and their price should be such as to place them within reach of persons of small means.
6. Free chairs should be endowed for the divulgation of the history and theory of architecture.
7. It would also be expedient to arrange cheap excursions to the most renowned buildings of all countries, the parties to be presided over by an architect who would lecture on the monuments visited.
8. Money bounties should be awarded for the best collections of buildings or architectonic works exhibited in cinematographs and theatre sceneries, &c., of which municipalities should afford gratuitous displays.
9. Artistic educational associations should be organised for the propagation everywhere, and with all the means at their disposal, of the teaching of art, more especially of architectonic art.

By OTTO WAGNER (Austria).

If the best model buildings are created by eminent artists the artistic interest of the public is sure to be awakened, or that already existing will be increased. It is, however, to be understood that the main condition always holds good, viz. that these models shall be of a very high artistic order; consequently, that they owe their origin to first-rate artists. Artists of the first class will adapt every work to the purpose for which it is destined, in every particular; they will make use of the most convenient material, and of the proper method of construction, in order to produce the best forms of art. Only in this way the desired characteristic and beauty of the work will be created, and only these will be able to satisfy the spectator. No doubt, then, the recognition will flash upon the spectator that the artist expresses his ideas in a language intelligible to all. But if the spectator is able to understand a work of

art, his aversion to enter into the study of a work will vanish, and will be replaced by the possibility and the will to judge it.

No doubt in order to create model works of architecture the co-operation of the State is necessary, because it is in the first instance the duty of the State to favour art, which is the gauge of civilisation of mankind. This State help, in order that it may be efficient, is only possible by the State, the country or a city—since it does not itself possess the necessary artistic intelligence—making use, for the solution of all questions of art, of an appropriate organisation, a senate which should be exclusively composed of participating artists, who would have to watch that only good work be produced. The architectural education of the public can only be rightly influenced by good work, for nothing is so victorious as good work.

By GASTON TRÉLAT (France).

The contemporary phenomenon of democracy characterises the world in which we are called upon to develop our powers. It tends to establish the equilibrium between classes. From it result comprehensions and feelings which from day to day become more general. So much for the nature of the spirit which characterises the public of our time.

Discoveries, which are due to the great initiators of the time, have lighted new paths in the matter of the salubrity of houses. Hence the anxiety with regard to the public health which we see nowadays. No sphere escapes from this anxiety, which seems to be a mark of our time, and which one may describe as a happy beginning.

In the same way, in consequence of an education perhaps unconscious but very real, the plastic arrangement of material has become a cause of impression in all social spheres. At least one meets everywhere people of unquestionable taste, who are sensible of correctness in form, this being always in accordance with the mode of imperfectly seen realisations.

Architecture is related to many sciences which have a living interest for the public. It is the object of current applications for these sciences, from which results an immanent cause of interest for the growing mass of the intelligent public.

But, again, the number of the admirers of public beauty increases daily; and as architecture is a considerable element of it, one sees there the evidence of a continually increasing education.

By GASTON ANCIAUX (Belgium).

The education of the public in architecture can only be brought about by long, patient and unceasing effort.

The most practical means to educate the public in matters of architecture are of a very numerous and of the most varied order.

Among these the following seem to us to be more particularly proper to give good results.

A. For the future:—

Within the shortest possible time

To establish or to develop at the various stages of teaching special lectures adapted to form the taste for architecture; or better still, above all in the classes of the elementary and secondary schools, to infuse this element into the general matter to be taught without making it the object of a separate course of lessons.

For this purpose, especially to divert to a greater extent the teaching of the history of wars and of politics of the nations towards that of the various stages of civilisation, by characterising them by their stages in architecture, without, however, separating this characteristic element from the most salient features of manners, costumes and social institutions of each of them.

Similarly to alter the direction in the teaching of geography in the same sense. For this purpose to arrange excursions for the pupils in their native town, in their province and their country generally, and even to foreign countries if possible. To illustrate with the same view the classical works with vignettes representing not only typical sites but also views of monuments and interiors (by preference of those still existing). To frame the text with ornamental fragments of an architectural and decorative nature by the best masters of the periods under consideration, and to choose only the most characteristic from among them.

To reform the present collection of pictures in schools in a more artistic sense by having recourse to artists of

value, and by making use of the modern processes of perfect and cheap reproduction, such as phototyping, chromolithography, &c.

To put, however, into the hands of the pupils only elements of the very best kind, and to look to quality rather than to quantity, to the composition rather than to the details.

For the teaching in the most advanced classes, to create professorships specially affected to architectural art and its philosophy.

To have this delicate subject only taught by a particularly able and specially competent *personnel*, as in the adverse case the results can only be disastrous and diametrically opposed to the aim in view.

B. For the present :—

To take action in such a way as to obtain the realisation of the following desiderata :—

(1) The creation of not only central museums of architecture in the capitals, but also provincial ones in the smaller towns of the country.

These museums would either be connected with the museums of painting and sculpture, or rather joined to the museums for the moulding and decorative art of which they would form the head.

These museums would contain, besides the graphic executions, the rough models, the photography and aqua-relles which would be more suggestive and more attractive to the public than the technical drawings.

These museums would also contain complete decorations of furnished interiors, where the properly so-called architectural framing largely treated would be accompanied by the explanatory graphic documents.

(2) The organisation in these museums of numerous public conferences and attractive temporary exhibitions of architectural works of recent creation or of projects of architecture, the latter in the widest sense of the word.

(3) For the public authorities to take care that only structures, be they important or accessory, of a temporary or a permanent nature shall be erected which are proper to form the taste of the public.

By ALBERT MAYEUX (France).

Of all the arts architecture is the one which concerns, or must concern, most mankind, since it is in relation with one of the immediate necessities of life—habitation.

Of all the arts architecture is the one which has in the highest degree exercised the genius of man, by the reasoning which is necessary for the conception of projects of an infinite variety, for their realisation and for the research of an æsthetic sensation in most of these projects.

It is also the only art which, so to speak, was created in all its parts by man. Whilst painting and sculpture only contemplate nature in different ways, taken as a model it is transformed by architecture and new forms are created, and in order to succeed in this even new products are created.

Architecture being of all the arts the one which reflects in the most intimate way the moral state of a period, to such an extent that it has been said that a monument was a book of stone in which history could be read on its indelible pages, it must be understood how much its teaching may be interesting to the public from the point of view of curiosity alone. That is to say that the faces upon which these teachings can be read are numerous and varied, but in order to be able to read it is necessary that they should be brought within the intelligence of the spectators, according to the surroundings and the class of public.

Now the public to whom an architectural education can be given is of two kinds—(1) The youth frequenting the schools and the soldiers. (2) The independent public.

The teaching to the students can naturally be imparted to them in the schools, lyceums and colleges, and that to the soldiers in the barracks, whilst, on the other hand, the instruction of the public may take place in the shape of conferences and collective visits.

A complement of instruction exists more or less for everybody in the books and libraries, but this is a means which it must be known how to administer, and which, in any case, is outside the range of a programme of special studies such as we wish to propose to the Congress.

It is impossible here to draw a positive programme of instruction, the professors and lecturers being of different

temperaments and aptitudes; it is only possible to point out a general line on which to proceed.

Collective visits to monuments and even to towns on the road of excursions at reduced prices, and all the pleasantness connected with similar excursions in company, are also to be enumerated among the best means of teaching architecture, because the sight on the spot conveys more to the mind than the best of photographs, and with a good lecturer *cicerone* the result, which, in short, is to succeed in developing interest and respect for the monuments and the necessity of their preservation, will then be completely obtained.

The question put by the Congress which we have answered in the foregoing seems to be of primordial importance, and we therefore utter the wish that societies similar to ours should study the elaboration of standard manuals for the use of lectures.

By JEAN GILSON (Belgium).

"Art comes from man and is intended for man. It is the flame of a spirit, its radiance; it cannot fail to affect first of all the being from which it emanates, and afterwards, from one to another, some other beings," said M. Sertillanges.

It is the same with architecture, the queen-mother of all the arts; destined, above all, to strike and to captivate the attention of the public. To attain this highly desirable end, which ought to be the object of a noble emulation, always on the alert, it would be necessary, to start with, to try to call forth gradually among the general public the beginnings of the æsthetic sentiment, which in a great number exists in a latent state.

It is therefore necessary that those who are convinced, the enthusiasts who possess the cult, and consequently the enthusiasm for art, shall fight, without respite and without weakness, against the slow and growing invasion of the domain of inspiration by pedantry which pretends to domineer and to reduce to mathematical dryness the creating genius.

Thus it happens that too frequently the mission to initiate into that immaterial thing called "art" is entrusted to pedagogues, to teachers, while the professional practitioners who have made of æsthetics and of their multiple applications the study and the constant practice of their existence are given the cold shoulder.

It would therefore be greatly desirable that only persons initiated into the sublime and imperishable beauties of art, special professors who have shown special capacity and made special studies, should be entrusted with giving to school children as well as to young men a good and healthy education of their visual organ either by the daily environments of the educative centre, or by rational visits to museums, by excursions, by illustrations, books, &c.

Let us likewise avoid the mistakes and exaggerations of the modern at any cost.

Let us carefully avoid trying to be innovators moved by the unwholesome desire to astonish, to stupefy the public.

Let us prove to this public that we endeavour to initiate it into the imposing splendours of the beautiful, to all the importance of arduous work, to the never-ceasing study which our art requires.

Let us make efforts to revive again the corporative spirit from which came to us those admirable and sublime creators: artisans, ignorant of the rules of pedagogy, even almost illiterate, which did not, however, prevent them from producing immortal pieces of workmanship, pure masterpieces of architecture, of tapestry, of ironfoundry, of joiner's work, &c.; privileged practical workers with an immortal genius, to whom we are indebted for our jewels of architecture as well as for our jewels of the decorative art, the one forming the pride of our ancient cities, the others the wealth and the value of our museums.

Being thus animated only by the care for the vital interest, for the future and the dignity of our profession, let us unite our efforts so that we may succeed in the creation of the diploma, which would be granted by a jury composed of master architects of recognised talent and merit.

This essential measure of defence would keep away the ignorant and incompetent who in our day give themselves the name of "architects," abusing this title, and, in fact, creating great prejudice to the prestige and good reputation of the profession.

(Continued on page 67.)

NOTES AND COMMENTS.

THE Labourers (Ireland) Bill, which has passed the House of Commons, will contain a clause of unusual character. Many complaints have been made about the class of men accepted by the local authorities in Ireland as architects. As a consequence of the incapacity of the new architects the labourers' cottages which have been erected at the public expense are not as satisfactory as is desirable. In the course of a few years it is likely that the repairs will be comparatively costly, and meanwhile the occupants will have to suffer much inconvenience. Mr. BRYCE, the Chief Secretary, was compelled, prior to the third reading, to introduce a clause which will make it incumbent on every person employed by a District Council as architect, engineer, surveyor or clerk of works for the purposes of the Labourers Act to satisfy the Local Government Board that he is qualified for such employment. The effect will be to deprive the local authorities in Ireland of a kind of patronage which enabled them to give their friends a lift by suddenly transforming them into architects or engineers. The leader of the Nationalist party declared he did not like the clause, and there is no doubt it will cause much dissatisfaction in board-rooms. But the evil cannot be ignored, and the clause was adopted without even the farce of having a division.

THERE was at one time some doubt as to the losing or preserving a right to ancient lights when a building is altered or reconstructed. A building may be under certain circumstances taken down, and yet the owner of the ground will retain his rights just as if the building continued to exist. It is possible, however, that recent decisions have not been without an effect in cases relating to ancient privileges. Cambridge House in Piccadilly, at the corner of Park Lane, was one of the best-known private buildings in the Metropolis. It might therefore be supposed that any building erected on the site would, as it were, inherit the privileges which so long existed. But from a judgment given by Mr. Justice WARRINGTON last week the rights to light in that building have been extinguished by the reconstruction. The owners of the property, Messrs. SANDONS, LTD., are erecting a large block of flats on the site of the mansion. On the other side of Park Lane Messrs. DUVEEN, the art dealers, are erecting new premises. On the ground that their light would be interfered with, Messrs SANDONS, LTD., applied for an injunction to prevent any diminution of their access of light so far as related to the windows of the ancient portion of their premises. Without calling on the defendants, the Judge said that there was not sufficient proof that the ancient lights had been interfered with in a legal sense. They were not dealing with old houses, but with new, and therefore judgment must be given for the defendants. The case is of interest, and will no doubt be accepted in dealing with other cases hereafter.

It is generally supposed that after the death of Louis XIV. the work of the Gobelins factory declined in importance. The most interesting set of tapestries produced during the reign of Louis XV. were the representations of his own performances as a sportsman, and which are known to amateurs as the *Chasses de Louis XV.* They were designed by J. B. OUDRY, the animal painter. Whether several copies were produced is not certain, but only two sets are known—one in Fontainebleau, the other in Italy. Louis XVI. admired them, and he had them copied, not in tapestry, but on porcelain panels at Sèvres. They were somewhat altered in order that he might appear to be the hero. The panels were supposed to have met the fate of much else connected with royalty in France, for as they disappeared it was supposed they had been destroyed, M. DE NELHAC, the conservator, has had the good

fortune to discover them in some neglected room of the palace. He has also ascertained the positions in which they were placed, and which it has been arranged they are again to occupy.

LOCAL authorities are afraid of encouraging concrete and steel construction. The majority of the codes of by-laws which are in use in provincial towns are silent on the subject. The extent of the responsibility which is incurred by approving of plans for walls which would not be constructed either of brick or stone is uncertain. Credit must, therefore, be given to the Carlisle Town Council for confirming the action of the health committee in approving of plans which did not comply with the by-laws relating to thickness of walls. The surveyor had assured them that the factory when constructed of concrete and steel would have adequate stability. Inquiries were made in towns where concrete had been used, and it was found that no accident had arisen. If a few more towns acted like Carlisle the authorities at Whitehall would no doubt sanction the adoption of a mode of building which has been found advantageous in other countries.

ARGYLL MOTORS, LIMITED: NEW WORKS AT ALEXANDRIA.

WE have lately described the important works which have been carried out in the Vale of Leven from the designs of Mr. CHARLES J. HALLEY and Mr. HAMILTON NEIL. They were opened on June 26, and are said to be the largest of their class in existence. We publish this week a general view of the administrative offices. The contract was carried out by Messrs. P. & W. ANDERSON, of Glasgow. In the interior marble is largely employed, and imparts richness to the hall, staircase and galleries. That part of the work was executed by Messrs. GALBRAITH & WINTON, of Glasgow.

(Continued from page 65.)

By ARTHUR HILL, B.E.

For the intelligent appreciation of any art or science some knowledge of that art or science is indispensable. It is not to be expected that the ordinary non-professional observer will take an interest in what he does not understand. To many people a new building represents nothing more than the money it cost, that being the only scale they are capable of applying to the object.

The value of university training for professional purposes does not now need an argument: the principle has been already adopted in some of the modern universities of this country. But why should the teaching be limited to professional students? Why should not the history of architecture, taught by a professional architect, be included as a branch of general history available to students specialising in history for the B.A. degree?

Several universities admit lectures on Classic art and archæology, but the "mother of all the arts" scarcely receives adequate treatment in lectures of this kind. Why limit the subject to the Classic period? Does not architecture, taken as a historical study, reflect the social conditions of a people in one century as well as in another? Taken from its own standpoint as an art, how can an artistic sense be better cultivated or acquired than by a critical review of the best buildings of all time that have survived to the present day?

Lectures on the history of architecture, showing its true basis of evolution, delivered by trained architects and with the prestige of the "university," would exercise an important and beneficial influence on the public appreciation of our art. For, in addition to the students who would take the university course, it may safely be assumed that through the medium of the university extension system, which is bound to follow the example of the parent university, lectures would be given and considerable interest aroused among a number of people in many parts of the country.

There can be no doubt that the criticism of those who have had the necessary training on which to form an opinion would be a valuable aid to the development of good architecture throughout the kingdom and a stimulating influence both to the architect and his client.

This is not the only way, but perhaps one way in which the public may be brought to take more interest in our professional work.

By Professor OTHMAR VON LEIXNER.

The public of the present time generally shows a very lively interest for the art of painting, that for plastic art is very much less universal, and with regard to architecture the public shows almost no interest at all.

The public generally neglects visiting architectural exhibitions, saying, "Oh, we do not understand anything about it; there are nothing but plans." In the rooms set aside for architecture we generally only meet with members of our own profession. It is impossible to speak about an opinion of the public on questions of architecture, for even if it expresses one it will be found that it is never the expression of an individual, but it will nearly always be found that this opinion has been influenced by other persons. In spite of all the uncertainty of the public with regard to styles of architecture, it always tries, however, to make out the style of any particular building, but the forming of an idea embracing the whole edifice is never attempted. Here and there some details attract attention, such as doorways, windows, gables, verandahs, &c. Unless his attention be drawn to them the non-initiated will pass without observation even before the most wonderful masterpieces of architecture. In the case of historical buildings the principal interest is often caused by the antiquity of the monument. Buildings in a state of ruin generally make a deeper impression on the masses than buildings which are well preserved.

The peculiar method of the education at school, especially in the teaching of freehand drawing is responsible for much of the ignorance. Until quite recently it was customary to teach drawing in such a manner that the pupil only learned to know the level surface and the colour; the general rule was to give to the pupil a model drawing to copy and the teaching was limited to two dimensions only. The teaching of drawing objects in perspective was limited to a minimum. By this fact is explained the understanding of the image and the colour, and the uncertainty or incapacity to understand productions of the plastic and architectural arts.

The criticism of to-day, even if it sometimes occupies itself with a question of architecture, is not generally lucid, and as a rule is not understood, because persons without any knowledge of the science of architecture will never be able to thoroughly understand a question of architecture unless the writer, however clever he may be with his pen, happens to possess the necessary technical knowledge. Finally, it is necessary to mention the opinions so diametrically opposed which exist among the body of architects themselves. By what means could the non-initiated form a somewhat clear judgment if the architects themselves are nearly always at war among themselves about the principles of their art? Neither must we forget to mention the frequently astonishing negligence of Governments in giving the orders for a public building to be constructed. The modern State buildings, which if they were models of good architecture would contribute to educate the taste of the public, are often built by persons who have a very poor knowledge of art.

To bring about an improvement in this state of things Governments and the societies of architects must unite in their endeavours. 1. The instruction in freehand drawing must from the beginning be given, not by model drawings of level surface, but from the actual bodies. 2. It should be the duty of the State to have public buildings of a certain importance constructed, not by officials, but by artists. 3. The societies of architects must carry out the following programme:—To arrange exhibitions of modern as well as of historic architecture, to give popular lectures on the subject, to take an active part in the literature on architecture, especially on questions of actuality, to gather together all the artistic elements, and to settle vital artistic disputes among the members themselves; to publicly exclude all those elements which in our days so frequently put architects of real artistic merit in the shade and which contribute to corrupt the taste of the public; to give the most efficient assistance possible to writers possessing a technical education who contribute to render architecture popular by summary as well as by more voluminous publications; and, finally, to bestow particular attention on the cultivation of national art among the local associations, with a view to the preservation of the monuments of the country.

At the premises of the Institute on Thursday the discussion on "Architectural Copyright and Ownership of Drawings" was brought to a close. Papers were then read on Subject 8: "To what Extent and in what Sense should the Architect have Control over other Artists or Craftsmen in the Completion of National or Public Buildings." The chairman was M. H. P. Nenot (France), supported by Mr. W. S. Eames (America). The secretaries were Signor Urioste y Velada (Spain) and Mr. Walton.

THE ARCHITECT'S CONTROL.

By Sir WILLIAM RICHMOND, K.C.B., R.A.

A SIMPLE question is asked upon a very complicated subject, complicated because we live in times when artists come much more rarely into touch than formerly. Cities are bigger, life is less simple, distractions of various kinds are ever hindering any artistic intercourse. Above all the State does not take much account of art. Education is in all hands, superficially. Hundreds of clever young fellows are taught the rudiments. How few of these gain permanent employment, or even make a living. Yet notwithstanding, the Institute is always broadening its ground; the Royal Academy seeks to be more comprehensive; the Art Workers' Guild has accomplished much, and the "Arts and Crafts" have succeeded in gaining the interest of a section of the public. Against the cold attitude of the Government towards art may be set a growingly democratic bearing of artists to artists. Architecture, sculpture and painting are getting only too slowly more closely into touch, and the professor of each separate art is gaining knowledge from the specialist. And yet there are great difficulties. The great mother of art, Architecture, is still shy of her children. For this there must be a reason. May it not be that though increased liberation from "Styles" finds a less pedantic outlook, still a really modern expression in architecture has not entirely overcome them?

The divorce of the three arts has been destructive to the highest art, which contains them all three. It is impossible to deny that the Royal Academy is *per se* an academy of painting; it has fallen to be so. The architectural room there enlists but little of the public attention. Why? The

average public is neither interested in nor does it know anything about that noble art which is beyond its power of comprehension, because it appeals to the most abstract of our senses, beauty of line and of proportion. Architecture is an art which appeals last, not first, to the average individual. Painting appeals first, first as portraiture, second as anecdote; that painting which is the highest, which is abstract, and hence in allegiance with architecture, appeals scarcely at all. The same may be said of sculpture, though in a less degree than of painting. Regard for the abstract beauty of form is very rare in England; thus architecture, sculpture and the higher forms of decorative painting have no market; they are not either of them, as it were, dealers' wares; their value is intrinsic, not fluctuating, and it cannot be grouped in the sale-room; therefore neither architecture, sculpture nor decorative painting is within the market. So much the better. Doubtless a combination of serious architects, sculptors and painters would be quite invaluable, a society, say, comprising a small number of each section of the arts, perhaps six architects, six sculptors and six painters.

The Institute is the very body to create this new departure from specialism and all its narrowing effects.

In my opinion no amount of "Papers," either for discussion at a Congress or for stimulating a pleasant chat at one of the evenings at the Institute, will ever lead further than that evening's passing instruction and pleasant pastime. There are many men capable of writing able articles, convincing also for the time being, but which very soon are found in that limbo called forgetfulness. We must get practically into touch; there must be no priority. Our several professions are full of difficulties which would be appreciated as soon as we could get to work together. The architect can learn much from the painter and sculptor and *vice versa*. It is "touch" that is needed, not "shyness," and real "touch" can only occur when practice follows precept in the initial stages of a great work. It is of little use for an architect to tell the sculptor or the painter, Here I want a statue, there a relief, here a wall-painting, &c. At the very initial the three should work together. There is nothing harder than the experience of an artist who is called to decorate a building with painting or sculpture which is in a sense complete without either. Surely the structure must be designed to receive. A niche is nothing without its statue, a sentry box is a silly thing without its sentry, just as a framed panel seems to ask for what it is framing, for something precious—marble, mosaic or colour. Incomplete is the monument to the Duke of Wellington in St. Paul's; it looks like a pedestal without a reason; it fails because it has no culmination. There are plenty of arches, plinths, pedestals scattered all over London which present the same absence in appearance of any utility. If there is no money forthcoming to complete a scheme, why ask us to imagine what all these pedestals, plinths and arches mean? They mean nothing; they are inadequate and senseless. Surely we can imagine a style of architecture the growth of necessity which shall ask for no adornment save that of beauty of line and dignity of proportion. That would be one thing, perfectly complete and quite comprehensive and entirely satisfactory as far as it went. But when we see forms which are not structural placed for purposes which they do not fulfil, are we not puzzled and dissatisfied? We are presented with shams. Now, if the architect, starting his design, says, I am going to design for sculpture and painting, and calls in the best sculptor and painter to consult with him, his hands will be strengthened; knowing how much money he has to spend, he will be able to portion out the various costs of the various parts of his scheme.

My main contention is that, with a view to closer touch between the architect, sculptor and painter, a committee, such as I have indicated, should be appointed by the Institute. That committee might in time become an advisory body to the Government and the London County Council, which both need assistance not only in common sense, but good taste also in all that applies to art.

By H. P. NÉNOT (France).

In all the bygone periods of art the same idea has united all artists. Painters, architects and sculptors had the same ideal, and the master of the work was sure to find in his collaborators a decorative interpretation in perfect harmony of feeling with his own composition.

How easy and simple were the professional relations between the architect and his collaborators, the painters and sculptors. They always spoke the same language, and

this common thought gave to their movements that beautiful union which is so difficult to obtain in our days.

The earthly paradise of the happy utilitarian periods is closed to us. We all wanted to eat the fruit of the tree of science. Critics and archæologists have taught us the history of art and of the different styles, and each of us, according to his predilections, has placed in them his apogee or his decadence.

In this confusion some beautiful individualities asserted themselves, but all these schools rendered the task of the architect very difficult when it was the question of decorating a monument.

At the time when the Sorbonne was in course of erection a fresco of 26 metres had been decided upon for the great amphitheatre, to decorate the part at the bottom which supports the cupola.

The success depended on the tone of this fresco. Puvis de Chavannes seemed to be the right man. With him the white stone wall, almost entirely covered over, would continue to bear its cupola. But my friend Benjamin Constant, appointed for another decoration in the same monument, wished to be appointed to carry out this fresco, and the President of the Republic, M. Grévy, informed the Director of the Fine Arts, M. Kempfen, that he wished very much that he should be given the work.

The position of the architect was painful. To resist the head of the State was a difficult matter, but, on the other hand, with the powerful pallet of Benjamin Constant the semi cupola would no longer be supported, and the general harmony would be destroyed.

I declared that if I was forced to accept Benjamin Constant I should give up the fresco and substitute an architectural motif for it. Then I was allowed to have Puvis de Chavannes.

This should always be the case. Instead of an architect having a certain artist forced on him he should be given a great freedom in the choice of his collaborators, and he himself must point out the artists and follow their work, without any other preoccupation than the general harmony of his work; and he should leave to the painters and sculptors, who are responsible for their work, every liberty of form or of colours, provided they do not prejudice that general harmony without which no architectural work can really exist.

By L. B. MÜLLER (Germany).

The author takes it for granted that in giving the commission to the architect in question the decision is based upon his evident capacity. Whether through success in a competition or structures specially remarkable for their qualities previously designed by him or carried out after his plans.

Architects thus discovered will and must possess so much common sense that they are able to give the necessary instructions to all co-operating artists.

If it is proposed that a public or national building, or also some monument, devised by an architect, shall be adorned with statues or pictures, the architect shall be the designer of the whole work. It is he who shapes the frame of the picture and gives the subject for it. The other artists are the co-operators. They have to subordinate themselves to his intentions in the dimensions, in the tone and harmony of colours, in order to obtain a desired effect; if they will not they must not assume the task.

If it is the question of a monument in which either the sculptor or the painter (interior monument) gives the tone or expression, the architect must subordinate himself to the intentions of the relative artist, and must continue making sketches until he has produced the impression desired by the artist, and if he cannot find it he must withdraw from the task.

If in the erection of public or national buildings a co-operative artist is forced upon the architect, or if, *vice versa*, in the execution of monuments an architect is imposed upon another artist, it is more than likely that their ideas will be diametrically opposed.

The stronger mind will prevail, and the work will be a failure.

The watchword in every case must be: The designer of the work shall have the choice and supervision of his co-operators.

But the designer ought not to be possessed of a false sentiment of honour. He ought not to reject an improvement on his design simply because it was not he who hit on the idea.

He should leave to his co-operators, so long as they work with ability on the lines of his design, not only a certain

liberty, but also a rightful share in the honour, e.g. a mention of their name, and credit for any improvement.

By so doing he honours himself. Now, if in what precedes it has been asked and reasons given for the subordination of the co-operating artist, then much more shall the mere artisan subordinate himself to the designer.

But, of course, the architect must in these spheres be sufficiently an adept so as to be able to give the proper decision in the various questions which may turn up to be decided upon.

He shall encourage the artisan to express his opinion about things he believes will contribute to the improvement of the work.

He shall without fear or favour refuse to accept any work done badly or slovenly, and in the conditions of tender he shall leave no doubt about this.

The architect must direct his fullest attention that everything necessary be carried out in the most beautiful (or most perfect) form.

In this nature must be his model, in which everything necessary is given in the most perfect form.

By GASTON TRÉLAT (Paris).

I do not hesitate to declare that the architect ought to have control—with no other limit than his aptitude and possibilities—over all the other artists and all the artisans.

This control cannot be too effective, both as to the construction and the arrangement. It is, thanks to this control, that the departments will be able to respond to the mind that the originator has placed at the service of the project, together with the social need which it enters into his speciality to supply.

Finally, with regard to the character which the plastic motive is to assume, the architect as composer is alone capable of ripening the idea which he has conceived and rendered practicable. It is only necessary to be provided with the multitude of forms which he has realised exactly by his sketches. The latter contain a complete order of ideas which the pencil permits us to understand and to hint at. And from it results a *maîtrise*—the word is not too strong—which belongs to the composer-architect, and which attaches him more and more to the elaboration of the work he has conceived.

Consequently it is to the architect that appertains the control of all the artists as well as all the artisans having to collaborate in the erection of monuments destined for the State or the public service.

And this until the absolute completion of the *ensemble* in question.

By OTTO WAGNER (Austria).

The quality and quantity of the architect's knowledge and certainly in the majority of cases his practical capacity, certainly surpass, as has been shown, the same qualities of his co-operators; they therefore actually force the leading part in the execution of any work upon the architect. This leading rôle, if it is to be crowned with success, must be provided with absolute power over all the contributing hands, because a correct artistic and technical harmony of the various parts depends on it, and only the creator of the work—that is to say, the architect—is in a position to make the necessary dispositions.

To this has still to be added that many works and modes of use of the material are invented by the architect himself, and that he must for this reason be the master to decide about every measure in carrying out tests, trials, in making samples, &c. No doubt that about matters which deviate from the broad way of the ordinary methods he will deliberate with the contractors and surveyors, and come to an understanding with them, but the final decision in the matter can only rest with him, because he alone remains responsible to the public for the success or failure of the enterprise.

If the architect has a certain security for the success of his work in the proper selection made by him of the persons to whom the carrying-out of the various parts of the work is to be entrusted, the importance of such a choice shows itself in a much higher degree when it is the question of a co-operating artist, because in this case a new factor, viz the individuality of the collaborator, is of the most vital importance. Every artistic conception of the co-operators must adapt itself completely to the intentions which the architect wants to realise, so that the work to be created appears as of one cast. Considering that the creator of the work alone can form a correct judgment about this, no doubt he alone is entitled to make the choice of his collaborators. The answer can therefore only be:—The architect, in the

construction of a building, is to be given absolute power over the co-operating craftsmen, but in a special manner over the co-operating artists.

By JOSÉ AMARGÓS, SALVADOR OLLER Y PADROL, P. DE MIQUELERENA, and SALVADOR VALERI (Spain).

It is a matter of practice in Spain that the authority of the architect must be supreme over all the artists and over the workmen until the complete termination of the monuments destined for the State or for the public service.

The architect must have the authority indicated in the question for the following reasons:—

First: Because the architect-surveyor must transfer his thought by the proper means, either graphic, written or verbal, as the case may be, to all the artists and workmen taking part in the execution of the monument, by explaining to them the reasons which determine him to take such and such a resolution; otherwise the monument would be devoid of that harmonious variety in uniformity which every architectonic work must possess.

In the second place: Because for every edifice is necessary and indispensable an architect to direct the work in order that the building shall be carried out in the proper order and without interruptions; otherwise it would be prejudicial to the monument and to the artists and workmen who contribute to its execution.

In the third place: Because without this authority the architect could not present the necessary estimates of cost and the technical management of the works would be difficult. In fact there would be created certain obstacles, dualisms and suspicions, which, besides causing prejudice to the professional moral standard, would be damaging to the realisation of the work itself, because the various parts would not be in harmony with a uniform judgment and study, and because the architect would not be in a position to insist upon the fulfilment of all the contracts of the different trades or arts which necessarily enter into the production of every public or State monument.

In the fourth place: Because it would be subversive of the dignity of the architect, who might be suspected to be lacking in the knowledge he is obliged to possess by his title and by the practical experience he has acquired in his profession, if the interference of another artistic authority were tolerated which would deprive him of the means to act, and would put him into antagonism with the conditions which must be united in an architect, and which are the outcome of the fusion of science and art.

In the fifth place: Because without this absolute authority the architect would remain by this very fact exempt from the responsibility which he enters upon towards the State or the Administration, because of being deprived of the means which such authority gives over those who are placed under him, as the artists and artisans must be—not that this subordination is to be considered as humiliating; rather, on the contrary, it is honourable for the man who is able to fill his place in the various walks of life.

In the sixth place: Because the profession of an architect is certainly the most complex of all the artistic careers and the one which requires the greatest amount of knowledge, which fact by itself alone gives him a superiority over all the other artists and workmen who take part in the works.

One case only can present itself in which the supreme authority of the architect may be doubted upon some points, viz. in the erection of monuments which at first sight appear to be almost totally sculptural, in which exceptional case the architect gives to the sculptor the necessary freedom of action, so that the latter in development of his idea shall not be hampered by the architectural art.

The following resolution on the subject of "To what Extent and in what Sense should the Architect have Control over other Artists or Craftsmen in the Completion of National or Public Buildings?" was adopted:—

"That the architect in the construction of a building should be given absolute power over the co-operating craftsmen, but in a special manner over the co-operating artists."

Friday, July 20.

A section of the Congress met on Friday evening last at the Grafton Galleries. Herr A. Wielemans (Austria) and Mr. R. Phené Spiers presided; M. Alcide Chausse (Canada) and Mr. H. Blanc (Edinburgh) acted as hon. secretaries.

THE TOMB OF AGAMEMNON.

IN his paper Mr. Cecil Smith described how, through the generosity of the Marquis of Sligo, the British Museum became possessed of three portions of shafts

of the columns which decorated the doorway of the Treasury of Atreus at Mycenæ. Aided by casts of portions existing elsewhere, and with the addition of some fragments already in their possession, the British Museum had restored the entrance of the monument in the form in which it stood at least 1,000 years B.C. It would be understood, the author said, that the rediscovery of the shafts did not actually afford any new data for the restoration, but the true dimensions could be determined beyond all doubt. The history of Classical architecture, however, received important details of the misty background which enveloped its origin. The excavations of Dr. Evans at Knossos and of Professor Halbherr at Phæstos had shown them that it was there they must look for the origin of all Hellenic culture. At present the centre of interest both at Knossos and Phæstos related to a period far remote from the Classical age of Greece, before the first temple of Classic order arose on Greek soil. But though the excavations on those sites had revealed a marvellous picture of the domestic life and thought of the Mycenaean world, of their architecture it had laid bare but little beyond the ground plans. There was, however, one class of remains of which the conditions of construction had favoured a more complete preservation. The so-called treasuries or tombs were intended to be covered in earth, and the kindly soil had preserved them more or less entire. Such buildings had been discovered at Orchomenos in Bœotia, at Menidi and Sparta in Attica, and, above all, at Mycenæ, where there was the most famous of all, the Treasury of Atreus, or Tomb of Agamemnon. Before the nineteenth century travellers regarded the building as the Tomb of Agamemnon, and Chateaubriand in his itinerary so described it. Pausanias, however, mentions the "subterranean buildings belonging to Atreus and his children, where their treasures were kept." Comparison with similar structures revealed by later excavations had shown that Chateaubriand was right and Pausanias wrong—the buildings were tombs. Moreover, they were not, properly speaking, subterranean. The mode of construction was as follows:—Into the side of a hill a broad passage-way (dromos) was driven, open to the sky and lined on each side with masonry leading up to the doorway of the chamber itself. The chamber was hollowed out of the earth (sometimes partly built up and covered with heavy rocks and earth) in dome or beehive shape, and lined with regular concentric cornices of squared masonry, narrowing gradually to a capstone at the summit. An example of such a tomb, the author said, occurred on an Attic vase in the British Museum representing the beautiful myth of Glaukos and Polyëidos. The tombs were not merely intended for the reception of the dead. The Greeks from very early times were devoted to ancestor worship; by death they thought the mortal put on immortality, and the tomb was not only his resting-place but a shrine at which his kinsfolk would at recurring intervals pay him semi-divine honours. In two instances (the Treasury of Atreus and the similar tomb at Orchomenos) a smaller side chamber was added at right angles to the axis of the tomb, and entered by a doorway in the centre of the right-hand side. Probably the side chamber was intended to receive the remains of the less important members of the family or the more precious offerings. In some of the later tombs the main receptacle was provided with a niche or pocket on one side to hold the offerings, a detail possibly reminiscent of the earlier custom. As the tomb chamber served the purpose of a shrine it was necessary that it should have a worthy passage and doorway, but the Treasury of Atreus was the only example in which the architectural features were so imposing and the wealth of decoration so elaborate. Before the beginning of the last century the tomb was already rifled and the upper part of the entrance laid bare, fragments of the richly sculptured façade still lying *in situ*. In the year 1811-2 the second Marquis of Sligo visited Greece, and during his stay interested himself, as so many travellers at that time did, in acquiring a small collection of antiquities. Last year the Earl of Altamont, in the course of studying the ancient monuments at Westport, came to the conclusion that certain columns in the collection were of unusual importance. He made careful drawings and photographs of them, which were brought to the British Museum, and the probability that the objects were the missing decorations of the Treasury of Atreus was at once evident. In the working of the columns there was an absence of precision which amounted almost to carelessness, exemplified both in the shafts and in the capitals. The pattern was not worked out to the edges, and in the shafts

especially the edges where they met the wall were left altogether unworked. This might have been partly due to the desire to strengthen a fragile post, but it would not account for the neglect of the pattern, which sometimes extended 4 inches from the edge. The fact seemed to indicate that the columns had been sculptured with decoration after they were fixed in position. The shaft was 18 feet 3½ inches in height, 1 foot 10 inches in diameter at the lower extremity and 2 feet at the upper, and showed a taper downwards of 2 inches. The peculiarity was also found in the pillar of the Lion Gate at Mycenæ, and was met with in the Minoan period in Crete, although the form was by no means universal. In the temple fresco at Knossos three such columns slightly varying were shown. Those columns might for various reasons be inferred to be of wood, hence their rather squat character. The Atreus columns were far more attenuated. This was what one might expect, the author said, in the translation from wood into stone, and for the same reason they might be prepared for the minute base at Mycenæ. What was the reason, he asked, for the tapering form? Various theories had been suggested. M. Perrot supposed that it came about through the necessity of pointing the end of the wooden post in order to fix it in the ground, but he seemed to stultify his argument by an attempt to explain the base. The author suggested they might find a satisfactory solution in the Egyptian column, originating from the bundle of reeds which tapered towards the base. Whatever the origin there was no doubt, he said, that the downward taper answered a special purpose at Mycenæ, where it served to correct to the eye the outward slope of the two sides of the doorway. The question of the decoration of the façade above the doorway was one of considerable difficulty. They might conclude there was a treatment of sculptured slabs, but though several suitable fragments existed it was only an assumption that they belonged to the façade, for not one scrap remained in its original place.

Sir HENRY HOWORTH remarked that the decoration was of a kind which, while increasing the dignity and beauty of the columns, did not diminish their appearance of solidity, and he wondered why modern architects had not adopted that method of treating pillars. The pattern was of an Egyptian type, and was probably attributable to the intercourse between the Cretans and the Egyptians. One of the most remarkable characteristics of the columns was that they tapered downwards. In former suggestions for the restoration of the Mycenaean columns the thin ends had been placed uppermost, but it had been now definitely established that the reverse position was correct.

Mr. R. PHENÉ SPIERS said it would seem that the Cretans were sufficiently acquainted with the qualities of timber to know that the trunk of a tree would support an equal weight whether in a natural position or turned upside down, and that when exposing a broad surface it would last twice as long as it would in another position.

Prof. BALDWIN BROWN asked whether the author had formed any idea of the origin of the ornamentation of the columns.

Mr. J. D. CRACE desired to know whether the many excavations had revealed any trace of the bronze plates which formed the cover of the interior of the buildings.

Mr. H. H. STATHAM proposed a hearty vote of thanks to the author of the paper. Mr. F. T. BAGGALLAY seconded the motion, which was passed by acclamation.

Mr. SMITH in his reply said that with the exception of a few nails no metal had been found in the excavations.

Saturday, July 21.

The final official meeting at the Grafton Galleries took place on Saturday. Mr. E. T. Hall said that he had been asked by Professor I. G. Clason (Sweden), the chairman, to conduct the proceedings. The secretaries were Mr. S. Chujo (Japan) and Mr. J. T. Cackett (The Northern Architectural Association).

The first paper, dealing with "A Statutory Qualification for Architects," was read by Mr. G. A. T. Middleton for Mr. R. Walker, by whom it had been prepared. After papers by Mr. John Archibald and M. L. Bonnier had been read, Mr. Hall announced that the paper prepared by the Society of Austrian Architects would be taken as read, as no representative was present. M. Gaston Trélat followed with his paper.

STATUTORY QUALIFICATION FOR ARCHITECTS.

By ROBERT WALKER.

THE word "architect" is derived from two Greek words, "archos" and "tekton," and signifies "chief constructor," which would appear to involve complete control and guidance from the inception of the design to its final completion in fitness, strength and beauty.

The word "qualification" signifies that the architect (or the chief constructor) should be duly qualified to undertake those responsible duties by the acquisition of an irreducible minimum of general and expert knowledge and technical education and equipment, in accordance with a curriculum laid down by the General Council, when appointed by Parliament under the stipulations of a Bill which when it passes becomes law, making compulsory "statutory qualification for architects" by placing the Bill on the statute book as the "Architects' Education and Registration Act."

The necessity for such an Act appears to be conceded generally owing to the consideration that has been given to the subject during the past twenty years.

The members of recognised architectural bodies should be registered on their proving their membership, or on verified lists being sent to the registrar by the secretaries of those bodies.

The stumbling-block which has chiefly and ostensibly retarded the progress of such a measure for all those years, coupled with apathy, indifference and jealousies, is precisely the same as that which blocked the Medical Act for thirty years, from 1828 to 1858, namely, that Parliament declined to pass a measure which made no provision for the vested interests of the unqualified men who assumed the functions of medical practitioners, and were accepted by the public in ignorance of their want of expert and technical equipment. It may be possible to come to some arrangement on this matter by way of compromise with the select parliamentary committee.

A time limit of, say, five years may be agreed upon, during which practitioners could prove that they were in practice prior to the passing of the measure.

There appears to be no doubt but that the trend of opinion is in the direction of obtaining statutory qualification for architects, which will protect the members of the profession and the public, in the prescribed parliamentary form of an Education and Registration Act having the short title "Architects Act."

The sooner such a measure is placed on the Statute Book the sooner will the evil complained of disappear. It will not impair the status and privileges, or invade the membership of existing architectural bodies.

By J. S. ARCHIBALD (Canada).

The subject is a delicate one for the profession to discuss, as motives can be so misrepresented; but for want of advocates outside the profession all the necessary agitation must come from within. The charge has been made that it is only another species of trades unionism, but on consideration it will be found that the principles underlying the formation of trades unions are wholly different from those which actuate us. The former is purely a movement to regulate the compensation and earning powers of the individual, whilst the latter is a movement to raise the standard of professional practice and to safeguard public interests.

Generally speaking, there are two sides to architecture, viz. the æsthetic and the utilitarian. As regards the latter, especially in its constructional aspect, there can be no difference of opinion as to the necessity for the most careful examination before being permitted to design and erect buildings. The object of an architect's labour is to prepare, generally speaking, for habitation by humanity. Human life has always been looked upon as valuable beyond price and compensation. It is recognised in the practice of medicine and law; why should it not be recognised in the practice of architecture, where requirements are demanded combining science, chemistry and law?

We are hedged about by legislative enactments which at their root must have emanated from the conviction that the practice of architecture was a responsible one, calling for particular training and study. Architects are compelled to erect buildings under the direct superintendence and dictates of the law. The only inference to draw is that the practice of the profession is of such a nature that

the individual cannot throw off all responsibility the moment the contract is complete. The logical sequence would also be that the law would make provision that all who enter into the practice of the profession would be found fully competent to carry out the spirit and dictates of such enactments.

It is obvious that such competence can only be established by a series of examinations. This is not always the most satisfactory method, but for want of a better we needs must adopt it. Such examinations must be all-embracing and wielded by powers beyond the faintest tinge of suspicion, and removed in the public eye from all question of self-interest.

With respect to the æsthetic side of the professional practice the standard of qualification is more difficult to set; but there is a basis which no one should be permitted to evade. We are all influenced to a greater or less extent by our environment. If in such an environment beauty is absent and ugliness predominant, depravity and a low moral condition will usually be found amongst the people. On the other hand, beauty is usually accompanied by refinement, a higher state of civilisation, and, as a rule, a higher moral condition amongst the people. It is therefore incumbent upon our legislators to recognise such influences. Such influences have been recognised from time immemorial. Plato has discussed the question fully in his "Republic," and even in those days he argued that State superintendence should be extended over sculpture and building, "so that they may be prohibited from exhibiting all forms of vice, intemperance and meanness."

A sense or perception of the beautiful is to be found within the soul of every human being. It should be our pleasure to encourage it at all times, to influence our community with its leaven of goodness, and it should be the duty of the State to recognise such influences and to grant a statutory qualification to prevent influences other than that of the good to be over her people.

The Province of Quebec Association of Architects is the pioneer (on the western side of the Atlantic at any rate) of statutory qualification for architects. This law was founded in 1898 as an amendment to the charter of incorporation. It was granted as it was deemed expedient for the better protection of public interests, and in order to enable the public to distinguish between qualified and unqualified architects, and to insure a standard of efficiency in the persons practising the profession and for the advancement of the art of architecture. This law reads:—"No person can take or make use of the name or title 'architect' unless he is recognised under this Act and as a member of the Association." The machinery is provided for the carrying out of a system of examinations and for the enforcing of the law.

By LOUIS BONNIER (France).

In architecture, which is at the same time the outcome of art and of science, more than in any other art, teaching is a necessity. Technical teaching, a deep study of the requirements, a reasoned knowledge of the materials, judicious application of the processes and artistic teaching, grouping of masses, harmony of lines, taste in details.

These two teachings which form a whole can, it is clearly understood, be theoretical only. They cannot be separated without giving incomplete results—either draughtsmen or builders, but not architects. Not architects, that is to say, not artists, whose mind, formed of logical ideas and of decorative feelings, is ready to undertake any studies, any adaptations, any kind of progress, able to choose from among several solutions proper to satisfy the engineer, the best, that is to say the most harmonious, the most beautiful. If the teaching is necessary for the transmission of the acquired results, it cannot be really efficient and useful unless it be accompanied by a sanction pointing out clearly the person to whom, amongst all others, may be entrusted with perfect safety the fortune of private persons and the budget of the State, the health of the individuals and the hygiene of the population, the preservation of the art treasures of a country, the improvement of the comfort of family and social life.

This sanction is the diploma.

The diploma which is the consecration of long scholastic studies, preparing the architect for all eventualities, cannot and must not be obligatory in a free country; it is only an indication and, as it has been rightly called, a powerful presumption of artistic and professional capacity. It naturally corresponds with a want which, for a great number of years, has been puzzling the mind of architects, and which forms part of the programme of every Congress. This want

has received full and complete satisfaction in France. The facts are there to prove it—they are evident.

The campaign was started as far back as 1840.

Since that remote period the Central Society of French Architects took the initiative, and during more than twenty years, by means of controversies, reports and resolutions it fought the good fight until the day when, in 1863, M. Eugène Guillaume obtained from the Government the decree instituting the diploma.

After a period of modesty and obscurity, during which the first possessors of the diploma, without a bond, without influence, without protection, and treated as intruders, were the objects of attacks as furious as they were stupid on the part of short-sighted architects, the architects with a diploma formed an association in 1877.

During a great number of years they struggled only to live, to hold on. Little by little their numbers increased. When they had become 200 the hostilities grew less; when they numbered 500, they were at last recognised.

There are to-day 750 distributed all over France, at the Institute, in all the great State administrations, in those of the provinces and of the large towns. They constitute special groups in the colonies and in foreign countries, in Switzerland, in the United States, adjudicators of the public competitions, propagating, to the best of their endeavours in the general interest and in conformity with their programme, the cult of the high studies of architecture. In 1912 they will be 1,000.

This striking development and this uncontested prosperity of the diploma in France show what an imperious want was answered by its creation. We are of opinion that, in the interest of all concerned, it is necessary to surround the title of architect with guarantees and to sanction it by means of the diploma.

By OTTO WAGNER (Austria).

On all sides the endeavour of artists to favour the progress of art is strongly prominent. Nay, they are, in fact, the only promoters of art, since the public, entirely absorbed as it is in the acquirement of riches and in politics, has lost almost every sentiment for art. It can, therefore, be understood that the desire makes itself manifest to protect art, and it is thought that this end will be obtained by giving the title of architect a legal recognition.

If the architect is given a legal authorisation, there cannot be any question of the artistic capacity of the architect, and an official control can only be admitted with regard to his professional quality. But this control is very easy, since all authorities have their well-organised boards of works which can exercise control when giving their consent for the construction.

The legal process must therefore consist in that the architect by his signature accepts the responsibility for the plans made by him, and that he covers himself by the contractors of the various parts of the work, who have in their turn to produce the calculations made and revised by them.

The architect has the right to construct any building by the plans made and revised by him if these have been passed by the artistic and technical control.

By GASTON TRÉLAT (France).

Diplomas are a good thing in proportion as the studies which they represent magnify and elevate the title of architect to the height which society prescribes in order to understand its aspirations. But they might easily become a cause of deterioration or, what is equivalent, of incapacity to understand anything but the knowledge and applications belonging to a special education. Then a diploma, taken as the criterion of every application of art or of useful knowledge, would be the height of human inanity.

When they are confined to being stimulations to work for young people, diplomas are an excellent thing. But they would become detestable if they were to trammel the free activity of the technician in later life.

The field of action is never opened wide enough to the aptitudes that society comprises. The advanced civilisations of Europe are often a cause of weakness in individual production. To understand this, one has only to cast one's eyes on younger peoples where the social organisation encourages individual worth, which might serve as examples to us. To sum up in a few words: though the diploma is for the student a restraint on his efforts, it becomes eventually an incident without influence on the career of a man of worth. One must go forward without ever looking behind.

M. AUGUSTIN REY (Paris) opened the discussion, and said that Society accuses architects of injuring the public health by their faulty dwellings. The contrary is the case. Society is killing architects by allowing the profession to be open to anybody who cares to claim connection with it. This was shown in the papers just read, and they prove that such legislation is essential as would, in the first place, protect the public, and secondly, the members of the profession. It was shown likewise that an examination should be arranged demanding a minimum of knowledge, so that the public would realise that anyone with the title of architect had won it only after that test had been passed, and thereby afforded some guarantee. After this point has been reached the interest of the public will be awakened. But before anything is achieved architects must fall into line in their ideas on the subject of statutory qualification. It would be well if in the next Congress this all-important subject were thrashed out, not after an hour or two of discussion, but after several meetings, so that there should be a combination of all architectural societies in respect to it. Already the most important step forward has been taken towards saving the architectural profession from the slough of indifference in which Society has left it.

Professor VIRGIL NAGY (Budapest) gave an account of the attitude of Hungary on the subject. At the last national congress of Hungarian architects and engineers it was resolved to promulgate a scheme having for object the legal definition of the titles and practice of architects, engineers and mechanical engineers. The Association of Hungarian Architects and Engineers were deputed to prepare a Bill providing for compulsory qualification and registration in the various technical branches of architecture. This Bill has been accepted by a majority of the Congress members and formally submitted to the Government. It will probably be soon brought before Parliament. If it is passed it will entail that the right to practise as an architect, engineer or mechanical engineer, and to assume such titles, will be conditional on some guarantee (yet to be decided on) as to the possession of necessary qualifications. All such qualified practitioners would be allowed to act as official advisers or as designers of any buildings, however important.

Mr. GEORGE HUBBARD, F.S.A., considered that the subject of the registration of architects had become of the foremost importance in Great Britain. The entire profession were anxious to do everything in their power which could elevate its status, the only difference of opinion being as to the best means of achieving that goal. The education of the public was a well-worn theme to them. But an even more urgent question was the necessity for improving their own education and of seeing that all who claim to belong to the profession should themselves possess education. At present this cannot be done, for its doors are wide open and all who wish may enter. In his opinion the mortal foes of architects and architecture are the ever-increasing limited liability companies. They adopt principles which are radically different and opposed to those of an architect worthy of the name. The boast of such a company, indeed its very *raison d'être*, is to supply the public with whatever they want, whether it be good, bad or indifferent. When this practice is extended to art its perniciousness becomes apparent, and most of all when it is concerned with architecture. A true architect should lead and not follow the tastes of the public. Of course, a large section of the public like to be their own arbiters of taste, and in consequence limited liability companies will continue to masquerade as purveyors of architecture until determined efforts are made to check them. The accomplishment of such a task as the enforcement of statutory qualification demands the co-operation of all.

Mr. R. WALKER (Cork) said that, previous to the Congress, he had often been troubled as to what would be its result. Congresses are one of the biggest factors in uniting all parts of the earth; they are attended by people who bring an open mind and a readiness to share and interchange their knowledge. Knowing this, he asked what had the present Congress achieved in the interests of architecture? He regretted that a subject of such vital importance was relegated to the very last meeting, and even then allotted so short a time. It was ridiculous to think that the matter could be fully dealt with in two or three hours. His own mind had been engrossed during the past fortnight with the thought of how the statutory qualification of architects might best be brought about.

Mr. A. NORTH (Tasmania) announced that, as delegate of the Tasmanian Association of Architects, he was under instructions to support any motion that would bring about

compulsory qualification. During the past fourteen years registration had been made compulsory in their part of the world in many professions. The architects have hitherto failed, and it will be necessary for them to renew their efforts. The demand for registration may be said to be shared by all, whether members of architectural societies or not. The progress in public recognition is suggested by the fact that last year a chair of architecture was established in Melbourne University. Such an event must be hailed with pleasure as being an official recognition on the part of the Government. In Tasmania the Institute was absolutely in favour of registration.

Mr. ELLIS MARSLAND wished to support the protest that had been raised against the arrangement by which a subject of the importance of statutory qualification had been dismissed to the last day, and, moreover, to a morning when a great counter attraction (visit to Bridgewater House) had been provided. He considered the subject under discussion to be of much greater moment than that dealt with on Thursday, namely, the education of the public. The reason for this is that until the architectural profession has itself been educated, it will be impossible for them to educate the public, for they would be the blind leading the blind. One of the great objects for which they must strive is the winning of public confidence, which at present is not theirs. Many men boast that they can dispense with the services of architects, for they are capable of doing everything for themselves. Others declare that they cannot afford the expense of an architect. The public do not know what an architect is and they not want to. The only means at their disposal for counteracting this feeling is to bring about that every person claiming the title of architect should be qualified. He therefore moved that the following resolution be passed:—"That it is desirable in the public and the profession of architecture that all practitioners should have a statutory qualification." This was seconded by Mr. W. W. THOMAS.

Mr. CHRIS. A. COWPER (Melbourne) stated he had been instructed by the Royal Victorian Institute of Architects to support any resolution such as had just been moved. A small Bill is shortly to be introduced into their legislative assembly with a view to bring about compulsory registration. The Victorian Institute would be very glad to hear if that resolution were adopted, for it would greatly strengthen their hands and assist them in attaining their object. Registration would, in his opinion, be a benefit both to the profession and the public.

Mr. G. A. T. MIDDLETON expressed great pleasure in hearing the unanimous agreement among all the speakers that there should be a statutory qualification of architects. In all the remarks made the principle was the same, though the form might be somewhat different. He hoped that the profession would obtain their wishes.

Mr. DAVID MORGAN (Wales) thought that a recent experience of his would show the necessity for action. He had had to enter into competition against a man who had been giving up his business as an outfitter in order to take up the practice of architecture. This man got his full percentage for all work done.

Mr. F. G. GREEN (Cape Colony) said he heartily supported the resolution moved by Mr. Ellis Marsland. He pointed out that all the bad architecture that was to be seen was not necessarily due to the present method of allowing anybody, whether qualified or unqualified, to call themselves architects. For instance, his experience in South Africa had shown him that gentlemen when desirous of erecting a house usually allowed their wives to make all preliminary arrangements. The lady makes excursions in order to get ideas of what would suit her. When she comes to a house that pleases her and suggests itself as a model, she makes inquiries not for the architect but for the builder. When he has been found, she tells him what improvements she would like on that model. The result of this combination could scarcely fail to be displeasing.

Mr. E. T. HALL, in closing the discussion, suggested that the subject should be adjourned. It was hardly fair to put the resolution to the vote because its opponents had all left the room, having other engagements. He found fault with many of the speakers and with the papers because they seemed to have this country only in their mind's eye. But the Congress was international, and therefore any decision arrived at should be of general applicability. He would like to amend the resolution in conformity with that idea. It should be understood that the diploma of architecture as known to Frenchmen is not a diploma which bars people from practising as architects. It is rather one of the greatest

honours they could obtain. The whole question had been very elaborately gone into by a committee in London, who made a most thorough investigation, and they arrived at the conclusion that compulsory qualification was not to be recommended at present. If statutory qualification was found to be desirable ten years hence nothing would prevent it. The following amended resolution was put to the meeting by Mr. Hall, and carried:—"That it is desirable, in the interests of the public of all nations and of the profession of architecture, that all practitioners should have a statutory qualification."

On the motion of Mr. E. W. FRITCHLEY (Bombay), and on the seconding of Mr. S. CHUJO (Japan), the following resolution was passed in silence:—"Resolved, that the Secretary be requested to convey to Lord Curzon the sympathy of this International Congress of Architects at the sad bereavement he has had in the death of Lady Curzon. This Congress feels it owes a debt of gratitude to Lord and Lady Curzon for their efforts in the preservation of ancient architectural monuments and in the encouragement of Indian arts and manufactures appertaining to our profession."

VISITS AND EXCURSIONS.

ON Tuesday afternoon the 17th inst. there were simultaneous excursions to (a) Hatfield House and (b) Hampton Court Palace. A very large party, numbering about 500, travelled to Hatfield by special train. On arrival at the main entrance of the house some remarks were made by Colonel Eustace Balfour concerning the history of the building. He then led the party through to the other front, where he showed the structural peculiarities. The party was then divided into parties of fifty, and went from room to room. The special train returned to King's Cross at 6.33. The journey by train to Hampton Court Palace was under the charge of Mr. H. P. G. Maule. In both cases the train provided by the railway companies was insufficient.

On Wednesday afternoon the members of the Congress availed themselves in very large numbers of the consent of His Majesty King Edward VII. to visit the extensive gardens attached to Buckingham Palace. After an hour spent in their inspection, a dozen motor omnibuses conveyed the party to Westminster Abbey. The Dean gave a short address of welcome and cordially invited everyone to make a thorough examination of the building, especially the Royal chapels (which were thrown open), the King Henry VII. chapel and the cloisters and chapter-house. The party then divided into two sections, one going to Messrs. Holloway's works, the other to Messrs. Doulton's works. Messrs. Holloway had provided tea for the visitors preparatory to going over the extensive shops near Westminster Bridge, and seeing the intricate machinery in operation. Visitors to the Doulton works were allowed to see the various steps necessary for the production of the famous ware. Each visitor received, in addition to refreshments, a glazed vase as a memento of the visit. On Thursday the visits were to Windsor Castle and a circular tour through London, including St. Paul's Cathedral, the Temple, St. Bartholomew's, the Institute of Chartered Accountants, Kensington Palace and Dorchester House.

Two alternative all-day visits were organised on Friday, the 20th inst., viz. to Oxford and Cambridge. The visitors who did not go to either place were able to see the town of London in the morning, followed by an inspection of the mechanism of Tower Bridge. In the afternoon they had a rendezvous at the central entrance of the Royal College of Science, South Kensington. Later they adjourned to the Victoria and Albert Museum.

On Saturday morning the attractions of Bridgewater House were opposed to those of a paper on "A Statutory Qualification for Architects." In the afternoon choice had to be made between a trip on the river to Greenwich Hospital, an inspection of the Houses of Parliament, or Westminster Cathedral.

A most successful evening garden party was held at the Royal Botanic Society's Gardens, Regent's Park, in which about 3,000 people participated. The guests were received for the first hour by Mr. and Mrs. Belcher and the members of the Council at the entrance to the conservatory. Inside, the Ladies' Salon Quintet were playing. "A Midsummer Night's Dream" was performed under the trees by Mr. P. Kirwan's Idyllic Players. Near the band of the Royal Horse Guards (Blue) was a rendezvous for all strolling about the delightfully illuminated grounds. Refreshments were supplied in a great marquee a short distance from the band.

THE SOCIETY OF ARCHITECTS.

THE twenty-second annual dinner of the Society of Architects was held on Thursday evening, July 19, at De Keyser's Royal Hotel. Mr. A. E. Pridmore, president, occupied the chair.

The attendance was greater even than that of recent years, the increase being accounted for by the number of foreign and colonial members who were present in London for the International Congress. Among the guests were Lord Monkswell, Sheriff Sir T. Vansittart Bowater, Mr. Paul Ogden, the Mayor of Holborn, Canon Vere, Mr. Alexander Ritchie, Mr. H. T. Smith, Mr. H. G. Montgomery, M.P., Mr. J. B. Wild, Professor G. Baldwin Brown, the Mayor of Finsbury, Mr. A. C. Scovell, Mr. Thomas Cooper, Mr. A. A. Hudson, Lord Stanley of Alderley, the Rt. Hon. James Bryce, M.P., Judge Rentoul, K.C., the Archdeacon of London, Alderman Sir Horatio D. Davies, Mr. James Bell, Mr. J. S. Fletcher, M.P., Capt. G. R. D. Drummond, Mr. D. Maclean, M.P., the Mayor of Fulham, Messrs. J. K. Brough, W. E. Riley, H. Montagu Bates, E. R. Woodward, W. J. Wetenhall, A. A. Millward, E. V. Huxtable, E. P. Huggett, R. G. Wilson, J. Sumner, R. F. Vallance, S. Perks, A. C. Freeman, Charles Welch, F.S.A., H. O. Tarbolton, F. L. Dove, E. Holmes, A. P. Poley, E. D. Drury, W. Scott-Deakin, E. M. Leest, H. Matthews, T. T. Cotterell, R. D. Batchelor, W. D. Driver, C. Day, J. C. Leavy, G. E. Bond, the Mayor of Chatham, J. R. Featherby, G. R. Viney, C. E. Skinner, A. R. Finch, J. R. Finch, W. J. Renshaw, R. G. Bare, H. J. Carter, R. Simpson, H. Byrne Jones, F. Tarring, G. W. Pridmore, C. Peek, R. Giles, Harry Bird, W. Atkinson, A. Newton, Deputy Wallace, T. A. Bullock, R. H. Barton, Sheriff-Elect Dunn, W. Bates, E. T. Agius, H. Weber Brown, H. Theobald, R. B. Martin, A. H. Campbell, C. Palmer, T. R. Croger, A. W. Fritchley, C. L. Gibbs, G. N. Paine, J. Bartlett, C. F. Dolan, M.P., A. Scott, R. M. Butler, Owen Owen, W. Lees McClure, W. W. Thomas, J.P., W. Woodward, Ellis Marsland (hon. secretary), W. C. Williams, D. Morgan, Chilton James, T. J. Jones, D. Rees, C. H. Mead, A. E. Carter, A. F. Wallis, A. G. Ware, T. R. Richards, J. B. Corby, C. Watkins, P. H. Ashby Bailey, F. W. Kinnear Tarte, Colonel F. S. Leslie, R. Walker, B. R. Tucker, J. H. Champness, E. Beal, G. Stainton, W. H. Robinson, G. Everard Davies, F. J. Sheffield, D. A. Langdon, P. Condy, A. Y. Mayell, H. Possenbacher, A. Chaussé, E. O. Sachs, L. Bonnier, G. A. T. Middleton, J. R. Manning, the Rev. A. Mercer, W. C. Lorden, J. M. Monro, S. Chujo, G. L. Gomme, J. G. Laing, the Mayor of Stoke Newington and C. McArthur Butler (secretary).

Mr. ALEXANDER RITCHIE, after the loyal toasts, proposed "The Houses of Parliament," and said he was sanguine that the bristling Bill for the Registration of Architects would receive the attention which it deserved when it came before Parliament.

Lord STANLEY OF ALDERLEY, responding for the House of Lords, said his words of thanks must not be taken as an intimation of favours to come. When the Registration Bill came before them it would be fully considered. Those who followed the trend of political opinion would agree that the House of Lords was beginning more and more to recognise what was a fact of the Constitution, that its place in the Legislation was secondary, and that it could not stand in the way of clearly expressed public opinion.

Mr. JAMES BRYCE, M.P., replying for the House of Commons, agreed that the State should show more encouragement to architects. Their art was the freest of all the arts, because it had the least to do with imitation, but it was more subject to external conditions, and to those conditions which might be imposed by the authorities of different districts. It was therefore especially interesting to inquire who were the authorities, and whether the Government was doing all that ought to be done to promote architecture and give it scope for development. There never was a time in English history when there was so much building, and when the needs of good building were so great as in the present day. There had been, in fact, extraordinary opportunities for architects during the last sixty or seventy years, but it was the fault of the State and the public authorities that the profession had not taken advantage of them. The authorities in the City had been to blame, for they had allowed opportunities to pass, and in the architecture and grouping of the buildings too much had been left to chance. Their buildings suffered from a lack of feeling, and there was not sufficient space in proportion to height and size allowed around them. In some instances the whole aspect of a

street had been spoilt for reasons which could have been avoided if the building operations had been controlled by a competent body. It ought to be possible to create advisory bodies possessed of artistic knowledge and skill who would be able to help both the Government and local bodies in such matters of national concern. In conclusion, he said there was a growing desire on the part of the present Parliament to endeavour to secure that the nation should live amid beautiful surroundings, and that the resources of the State were spent in ways that would give people pleasure.

Mr. R. F. VALLANCE (vice-president) submitted "The London Local Authorities." He congratulated the Corporation of London on the acquisition of so fine a building as the new Sessions House and referred to the good work done by the London County Council.

Deputy M. WALLACE, responding for the City, said the Corporation had endeavoured for years to municipalise its education and to bring harmony into the homes of the citizens through the agency of the School of Music. By the exhibitions at the Guildhall they sought to popularise the works of great masters both at home and abroad and extend the love of the beautiful in art. The money they were about to expend on the Blackfriars Bridge exemplified the zeal of the Corporation, and he thought the services of gentlemen present might be asked to guide them in that undertaking.

Professor R. SMITH (Mayor of Holborn) also briefly replied.

Lord MONKSWELL proposed "The Society of Architects," and in alluding to the president, said Mr. Pridmore's ability as an architect was well known. He held a number of important offices in the City, not least among them being that of consulting architect to the City Guardians, an appointment which required many qualifications.

The PRESIDENT, in reply, said the history of the Society, which had existed for twenty-two years, was the history of the movement in favour of the statutory registration of architects. At the present time, unlike other professions, the law would allow that anyone might practise as an architect; that was damaging to gentlemen practising a noble and honourable profession, and was, in addition, considered unsatisfactory to building owners and the whole of the community. As a Society, they were pledged to a definite course of action in the matter. They had given consistent support to the movement for registration, and had persistently striven to get Government recognition of the status of architects. In the first place, the Society supported the Architects' Registration Bill committee, a body of architects distinct from any society, who were attempting to obtain that much desired reform. Many architects of different societies were now in favour of registration, and he hoped the time was not far distant when the whole of the profession would be agreeable to promote a Bill on the lines the Society had advocated. In any case, their energies would be directed to that end, and they were prepared to spend their resources to bring about the realisation of the object they had in view. They had support from many outside their own body, and they were determined to see the measure through. It was gratifying to be able to state that they had with them that evening many who were instrumental in forming the Society, and some who, after twenty years, were still holding office. The Society had made steady progress, and now had a membership of over 800, and had members in all parts of the world. Early in the year a travelling studentship was instituted, which attracted a large number of entries and resulted in many excellent designs being submitted. During the year the Council had instituted a distributing library. This was most valuable for provincial members, who could have the books sent them by post. They were also grateful to the Corporation of the City of London for their gift of over thirty commemoration medals, which would find a place in the reference library. The membership was not limited to the United Kingdom, and recently branches had been established in India and in Africa. At that period of the year it was their custom to have an excursion of a few days to places of architectural interest. In view, however, of the fact that that was the International Congress week, it was thought desirable to abandon it in order that members might attend the Congress, where, he was pleased to say, three of the members were reading papers on matters of interest, and one of their past presidents (Mr. Robt. Walker, of Cork), one of the pioneers of the movement, was reading a paper on "Registration." On behalf of the Society he desired to thank the noble and distinguished company who

had encouraged and honoured them by their esteemed presence that night. They were all kin in the world-wide domain of architecture; their rivals were their best friends and the heroes of them all.

Mr. G. A. T. MIDDLETON proposed "The Visitors."

His Honour Judge RENTOUL and Mr. T. COOPER (president of the Birmingham Architectural Association) replied.

THE LONDON COUNTY HALL.

THE following important report has been prepared by the establishment committee of the London County Council:—

Now that the London County Buildings Bill, 1906, has passed through both Houses of Parliament, and is expected to receive the Royal Assent on July 20, we desire to submit our suggestions with regard to obtaining designs for the new county hall.

The Council will remember that the site has an area of 5.6 acres, and is bounded on the west by the river Thames, on the south by the approach to Westminster Bridge, on the east by Belvedere Road and on the north by the premises occupied by the works department, and that the site, together with the land occupied by the works department, has an area of about 7.5 acres.

With reference to the course to be taken by the Council for obtaining designs for the new offices, it may be mentioned that at the outset of the consideration of the matter a communication was received from the Royal Institute of British Architects, expressing a hope that it might have the privilege of advising the Council in the matter of securing designs of this important building, in which "an exceptional opportunity will occur of realising the educational value of the art of architecture and of fostering the arts and crafts of the day." We expressed our willingness to receive and consider any suggestions which the Royal Institute might desire to make as to the best means of securing the erection of a "dignified building" suitable for the administrative needs of the Council, and subsequently the Royal Institute expressed the opinion that the only way of securing such a result as the Council naturally desired was to obtain, "by some means or other, a strongly individualised personality to deal with the problem under properly defined conditions," and the Institute suggested that the method most likely to achieve that result would be to institute a competition. In support of this view the Institute called attention to the fact that the designs for the undermentioned buildings were all so selected:—

The Houses of Parliament and the Foreign Office in London.

The Hôtel de Ville, the Opera House and the Palaces of Art in Paris.

The Houses of Parliament in Berlin.

The Central Library, New York.

The Institute pointed out that in the case of some of the buildings referred to there was a preliminary and a final competition, and expressed the opinion that this is the method best suited to the requirements of the Council. It was further suggested that, with the view of securing that some of the leading architects should take part in the competition, several should be invited to compete in the final stage. At the same time the Institute forwarded the heads of a scheme for giving effect to the suggested competition.

Careful consideration has been given to the suggestion of the Royal Institute of British Architects, and also to the report from the architect of the Council on the courses which could be followed, viz. unlimited competitions, limited competitions, appointment of a nominated architect, appointment of an official architect, and appointment of an official architect in collaboration with a nominated architect of eminence.

After full consideration of the various suggestions, we are strongly of opinion that the Council should have a competition, and that the scheme should be on the following lines:—

That the competition be divided into two stages: (a) the preliminary, (b) the final; the preliminary stage to be open to architects of any nationality, and that not less than ten and not more than fifteen of the best designs shall be selected in private by assessors; the final stage to be open to (1) the authors of the designs selected by the assessors in the preliminary stage, and (2) not exceeding eight leading architects to be invited by the Council to send in designs before the expiry of the period within which designs must be sent in for the preliminary competition.

We think that there should be two assessors for the preliminary stages of the competition and three for the final, and that Mr. W. E. Riley, the Council's architect, and Mr. Norman Shaw, the senior architectural Royal Academician, should be nominated to act in both stages, and that the competitors in the final stage should vote for the third assessor, who will only act in that stage.

We suggest that each of the competitors in the final competition should be paid a fee of 200 guineas, and we will report next week as to the remuneration of the assessors. We also expect to be in a position to report as to the date by which the designs should be deposited at the county hall.

If the Council endorses our views, and decides to have a competition, the Council's architect should prepare detailed particulars of the accommodation required by the Council, having regard to the functions of the Council itself, the work of its committees and of the several departments, and the intricacies of their detailed workings both in their relations to each other and to the public. When fully matured, these particulars would be submitted as the basis of the competition. The instructions to competitors would indicate that the particulars showed the minimum accommodation, and that license would be permitted to depart therefrom in any details which might be considered necessary for the development of the elevations. Following the principle recognised by Government departments in the buildings for the War Office, the Local Government Board and the Admiralty, we propose to make it a condition that the successful competitor, if appointed, shall collaborate with the Council's official architect, who should have discretionary power in all matters relating to the internal economy and construction of the building.

We are forwarding to the finance committee a supplemental estimate in respect of the fees for the assessors and the competitors in the final stage of the competition, and we trust that that committee will be in a position to submit the estimate to the Council before the adjournment for the summer recess. We recommend—

"That the establishment committee be authorised to take all the necessary steps for obtaining the preliminary plans and arranging for the competition on the lines indicated in the foregoing report, for securing designs for the new county hall to be erected on the Westminster Bridge site."

Southwell Cathedral.

SIR,—The *Architect* of October 7, 1898, published a double-page plate of Southwell Cathedral from the south-east. It will be noticed that about halfway along the choir wall and close to the flying buttress there remains the weathering of the high roof to the south aisle chapel, which obviously also had a high gable. Perhaps some old print is in existence to show what that gable was like. Anyway, it should not be impossible to find an architect who could "reconstruct" the gable and roof in question, and thus make more complete the restoration of the building by such an effective addition; but in doing so care should, of course, be taken to reproduce the mouldings and shafts and small detail of the other windows of the chapel as far as possible. The present parapet of the aisle chapel is obviously of a different date to the rest of it, the south front of the parapet being a very much flattened pediment. In the additional space secured by the raising of the aisle chapel roof to its former level, room could be found, no doubt, for storing choir books, &c., not actually in use.

The choir roof itself was also apparently a high one, possibly finishing off at the east end in much the same way as Romsey Abbey Church does at present. It seems a pity to leave a long low roof of later date to disfigure the beautiful choir. The raising of it to its former apparent level would add dignity and charm to the venerable cathedral.—Yours obediently,

JOHN A. RANDOLPH.

Registration of Architects.

SIR,—The Congress passed a resolution admitting that registration or protection is advisable, so I presume the Royal Institute of British Architects will now take the matter up, and I trust that at the same time the whole question will be considered of a legal remuneration

adequate with the amount of work done. But will the present Government look kindly at a protective Bill, and so put an end to Free Trade in architectural matters? We in the country suffer most in this respect. I am not wishing to raise a political discussion; in fact, I quite understand that *The Architect* is too "conservative" to permit a discussion on tariff reform even in architecture and the "liberal" payment for our "labour." Apologising for this outburst,—
Yours, &c.,
A COUNTRY COUSIN.

SIR,—So the International Congress of Architects is at last a thing of the past. We have all had a good time, but what about the results—will any good come from the Conference? Anything tangible, and will the profession be raised to something higher than as at present? Shall we see compulsory registration and its consequent raising of the status of the architect to something better than a mere draughtsman and commission agent? Will some of the gentlemen who have worked so hard to make this Conference a success take up the registration question as ably? If they will, then they will receive the reward of deep gratitude from all who can only sign as

ARCHITECT AND SURVEYOR,
and not building specialist, sanitary engineer (drains kept in order for 21s. per annum), undertaker, building engineer, or even as a card I saw last week, "Mr. John X—, Mem. of —, Mem. —, Mem. of something else, architect, surveyor and specialist on art furnishing and decoration, sanitary surveys."—Yours, &c.,
A.R.I.B.A.

The Building Trades Exhibition, 1907—Olympia.

SIR,—It may interest your readers to know that, owing to the phenomenal success of the Building Trades Exhibition held biennially under my management since 1895, I have secured Olympia for the next show, which will be held from April 6 to 20, 1907. The available space at the Agricultural Hall has of recent years proved quite inadequate to meet the demands for space, but as the accommodation at Olympia is practically unlimited, important firms hitherto excluded will now have ample opportunity of displaying their manufactures to the best advantage.

The exhibition will be conducted upon the same lines as hitherto, and exhibits not appertaining to the building industries will be excluded.—Yours faithfully,

H. G. MONTGOMERY.

43 Essex Street, Strand, W.C. :
July 26, 1906.

GENERAL.

Mr. Thomas Garner, architect, of the Manor House, Fritwell, Oxford, sometime in partnership with Mr. G. F. Bodley, R.A., has left property valued at 13,194l. 15s. 3d.

The Extension Board of the University of London propose to arrange for a three years' course in architecture. Mr. Banister Fletcher will be invited to give the first year's course if at least sixty students enter their names as willing to pay a fee of a guinea for a session of twenty-five lectures. Place of delivery and time have to be settled.

Mr. James Kenward, F.S.A., who died recently at Great Yarmouth at the age of seventy-seven, was a member of the Birmingham and Midland Institute and of the Archæological Society. Mr. Kenward was one of the oldest surviving members of the Society of Antiquaries; he was elected in 1870, and was for a considerable period of his life in the employ of Messrs. Chance Bros. & Co., glass manufacturers, Oldbury, where he occupied an important post in the lighthouse department.

The Town Council of Edinburgh have approved unanimously of a recommendation by the Lord Provost's committee that a portion of the cattle market property at Lauriston, to the extent of 1½ acre, should be set apart as a site for the proposed new municipal art school, and the city superintendent of works was instructed to prepare sketch plans of the buildings for the consideration of the committee.

Mr. T. H. Longfield, F.S.A., architect, is retiring from the keepership of the art division of the National Museum, Dublin, which he has held for nearly thirty years.

The Hawick Town Council have agreed to accept custody of the Hawick Archæological Society's museum for behoof of the inhabitants on terms mutually agreed upon, the Corporation to provide accommodation for the large and valuable collection comprising the museum in Wilton Lodge Mansion House, situated in the Public Park, and to receive 450l. from the Society.

The Hon. Secretary of the Cape Institute of Architects has written a letter to the Commissioner of Public Works regarding the new Law Courts competition, stating that his Council was very dissatisfied with the reply to the communication addressed to him by the Institutes of Architects of Natal, Transvaal and Cape Colony, as well as his refusal to publish the assessor's report. The Institute has, therefore, deputed the president to interview some of the members of Parliament for Cape Town with a view to the question being raised in the House during the estimates, and thus endeavour to obtain the desired publication.

The Committee on Ancient Earthworks and Fortified Enclosures, of which Lord Balcarres, M.P., is chairman, expresses disappointment in its annual report that the archæological societies of the country have not yet been able to undertake the systematic scheduling of the ancient earthworks and defensive enclosures in their respective districts, and urges the importance of the publication of such lists. While increase of general interest in ancient earthworks, constructed for defensive or sepulchral purposes, is manifested, there is need for active antiquaries in all parts of the country to keep keen watch over ancient fortifications of earth and stone and to endeavour to prevent their destruction by the hand of man in this utilitarian age.

The National Service League offers three prizes for the best coloured pictorial postcards illustrating the ideal of the League, namely, national military training accepted by the nation as a civic duty. The first three prizes will be of the value of 25l., 8l. and 4l. respectively, and 1l. 1s. each will be awarded for the three designs next in order of merit.

The Office of Works has offered to grant to the Berwick Sanitary Authority a license for the maintenance of the remaining portion of Berwick ramparts not yet conveyed to them. They stipulated that the Authority should bear half the cost of maintenance of the walls, that any necessary repairs should be carried out by the Board of Works at their own discretion and that no alteration to the walls should be made by the Authority without their consent. The Mayor said these conditions were too onerous for their acceptance.

Mr. Walter Young, district auditor, in his audit of the accounts of the Acton Council, has disallowed an item of 1,500l. paid in fees to the architect of the town hall and public offices scheme, which was rejected by the Local Government Board on the ground of extravagance, the cost being 100,000l.

Mr. S. H. Egan has become senior partner in the firm of theatrical and hotel architects carried on by Mr. Walter Emden, J.P., of Lancaster Place, London, and the firm will in future be carried on under the style of Emden, Egan & Co.

The Roman Villa at West Meon will be open until the end of August. Considerable advance has been made with the excavations this summer, and it is now possible for the visitor to get a very clear idea of the ground plan of the house, which is of unusual architecture. The villa covers an area of 160 feet by 50 feet, and consists of nine living rooms, three of which are paved with mosaic, one being in a remarkably fine state of preservation. Pottery of the usual Romano-British type has been found on the spot.

At the St. Pancras Town Hall, Pancras Road, N.W., the six sets of designs submitted in the central public library competition will be exhibited on the 27th and 28th inst.

The Special Arbitration Committee of the Metropolitan Water Board at the last meeting submitted a report showing that the total cost to the Board of the arbitration proceedings amounted to 255,584l. Sir Melvill Beachcroft, chairman of the committee, observed that, in view of the fact that the arbitration involved a sum of 47,000,000l., a quarter of a million spent in law costs was not out of proportion.

The London County Council on Tuesday agreed to a motion of Captain Swinton that "consideration of the Strand frontage question be postponed until the improvements committee report as to the advisability of setting back the present northern line of frontage in the Strand between St. Mary-le-Strand and the eastern end of Aldwych, and of modifying the southern line of the frontage of East Aldwych, so that an area of land, approximately equivalent to the additional land surrendered for the widening of the Strand, may be appropriated out of the roadway of Aldwych with a view to avoiding any reduction in the area of land available on the 'island' site for building purposes."

The Architect.

THE WEEK.

THE subject of the new London county hall came up for consideration on Tuesday. We printed last week the report of the establishment committee. The finance committee, it should be remarked, are not satisfied with the arrangement. They say:—"The proposal to spend a large sum in obtaining a suitable design for the new county hall appears to be costly. We appreciate the desire of that committee that a dignified building suitable for the needs of the Council should be erected, but, looking at the matter from a financial point of view, we venture to hope that it may be possible to attain this object without offering to pay so many fees. No specific provision has been made in the capital estimates of the current financial year to meet this expenditure, although 1,000*l.* is provided for the preparation of plans, but we understand that there is no likelihood of the fees having to be paid before the end of the year. In addition to the expenditure in respect of which this estimate is submitted, further expenditure will be involved in remunerating the assessors selected to adjudicate on the designs sent in." In consequence the establishment committee only asked approval in respect of the fee of 200 guineas which it is proposed to pay to each of the competitors, not exceeding twenty-three, who take part in the final competition. It is calculated that sixteen weeks will be required for the preliminary competition and seventeen for the final stages. It is therefore anticipated that the date for receiving the preliminary designs will be May 7, 1907, and for the final designs October 3, 1907. On Tuesday Sir MELVILL BEACHCROFT expressed a fear that what would be undertaken would be an ornate building more suitable for a Parliament house than a dignified workshop. His amendment in favour of economy was lost, the voting being fifty-five votes to twenty-one. Another amendment by which the competition would be restricted to British architects shared a similar fate. Since English architects voted at the Congress in favour of international competitions, consistency compels them to accept the principle.

At the present time, when the subject of keeping roads in condition is causing so much anxiety to authorities and surveyors, it may be well to record an experiment of the county surveyor for West Sussex on the main Brighton road between Henfield and Woodmancote. Tar was first laid on the old road surface, dry rolled, and afterwards treated with a composition of tar and pitch, a sprinkling of granite chippings being afterwards applied as a finishing coat. It was then found that the road was much less noisy than ordinary macadam, and being waterproof, a much thinner coat of material was necessary than with the old form of maintenance. As regards cost, this method of construction compared very favourably with the old system, and in addition reduced the dust nuisance to a minimum. The length of road treated was 232 yards, with an average width of 21 feet, giving an area of 1,624 yards super. The total cost was 93*l.* 5*s.*, and the cost per yard super nearly 1*s.* 2*d.*; cost per mile, 718*l.* 13*s.* 4*d.* To cover the same area with granite, applied in the ordinary way, and having an average thickness of from 3 to 4 inches, the cost would be 128*l.* 8*s.* 4*d.*, the cost per yard super 1*s.* 7*d.*, cost per mile 975*l.* 6*s.* 8*d.*, showing a saving in favour of the tarred material of 5*d.* per yard super. The cost could be still further reduced were a special gang employed at the work who would travel with the roller from point to point as required. Requests were received from several parts of the county that roads should be treated with tar, but the committee assented only on condition that the locality bore part of the cost.

LAST week we noticed a light and air case in which certain rights attached to an old building were claimed for a new one on the same site. A case closely connected with it was heard on Friday last before Mr. Justice WARRINGTON. In the former case the owner of the new building was the plaintiff. In *ANKERSON v. CONNELLY* the plaintiff was the owner of old buildings, who feared that claims for an easement over his property might be created by the erection of new buildings. The defendant had purchased three houses in King's Cross Road to form a site for new buildings, and the plaintiff, who was the owner of adjoining premises, feared that his liberty in putting up new premises would be restricted. Mr. Justice WARRINGTON said that the defendant had made it impossible for the plaintiff to erect a building such as he formerly could have done without interfering with the defendant's rights. But that impossibility was the creation of the defendant, who could not therefore successfully maintain an action to enforce his claim to light. He had deprived himself of any rights which he could enforce, and judgment was therefore given that the defendant was not entitled to any easement over plaintiff's land. The decision will clear many doubts which now exist, especially in cases where one party by precipitate action considers he can secure rights or easements which cannot be interfered with by owners of adjoining property.

THE Building Act committee of the London County Council are at present considering the whole question of the Tribunal of Appeal, and propose to report on it at an early date. We have already mentioned that the members have appealed to the Home Secretary concerning the scale of remuneration. The scale laid down by the Secretary of State in 1895, and continued in operation from year to year until 1905, was, for each member, three guineas for the first hour and two guineas for each subsequent hour of each day's sitting of the Tribunal. On March 20, 1906, the County Council decided to inform the Secretary of State that it was of opinion that the present rate of remuneration was sufficient, and that no adequate reason had been shown why it should be increased. There is apparently no reason to alter that decision at the present time. It is therefore recommended that the scale should be continued in operation during the present year.

ALTHOUGH county authorities are skilful in making out claims against contractors on account of extraordinary traffic, yet that of the Dunfermline district committee of the Fife County Council against Messrs. M'ALPINE & SONS probably will long be unsurpassed. It arose out of the construction of the Dunfermline-Kincardine Railway, and the amount was 6,136*l.* 5*s.* 11*d.* Sheriff SHENNAN, who investigated the case, adopted Lord Justice BOWEN's definition that "extraordinary traffic is really the carriage of articles over the road, at either one or more times, which is so exceptional in the quality or quantity of articles carried, or in the mode or time of user of the road, as substantially to alter or increase the burden imposed by ordinary traffic on the road and to cause damage and expense thereby beyond what is common." The contractors admitted that about three miles of road were damaged. The plan adopted by the county was, however, shown to be absurd. But the actual amount of damage was difficult to ascertain. The sheriff considered each road separately, and came to the conclusion that the amount to be awarded to meet the extraordinary expenses was no more than 1,045*l.* This is only a little above one-sixth of the claim made by the authorities. The county will have the costs, although, as the sheriff said, the case was greatly overstated. Allowing that damage was done to the roads, the preposterous effort to abstract so large a sum from the pockets of contractors should have been punished by making the county authorities bear their own costs at least.

THE PROGRESS OF ART.

THERE is a class of men who always look backwards because they prefer the past to the present. It often happens that some of their representatives become heads of academies, colleges and schools, and then the students are to be pitied. Young people are often rebuked for an excess of confidence in their own abilities. But that may be more apparent than real. As a rule students should be encouraged by their guides, and especially students of art. Unless they possess extraordinary endowments from nature the life before them is precarious. In the majority of callings men have only their contemporaries as competitors. But in the arts they have to fight their way with old masters. The returns of the sales in auction-rooms during one season in London will suggest the intensity of the contest as regards painting. Sculptors and architects may not suffer to an equal extent with the painters. But their work is continually undervalued by comparison with what was produced centuries ago under very different circumstances.

When Herr VON WERNER, the director of the Berlin Academies for Art, presided at the annual distribution of prizes to the students of one of the art schools a few days ago, he adopted the tone of Mr. CROAKER when addressing them. His speech took the form of a comparison of their work with the work of the men who painted fifty years ago, examples of which were to be seen in a retrospective exhibition at Berlin. It is needless to say that he found the modern attempts far inferior to those of the students' predecessors. All arose, Herr VON WERNER considered, from the thoughtlessness and haste of modern times, from a misunderstanding of realism and other causes. Herr von WERNER, as all the world knows, is an able painter. At the present time he is the representative painter of Germany, because he paints military scenes with an accuracy of detail which would satisfy the sternest martinet in the army. There is some excuse for him if he partly adopts the tactics of the barrack-square, and endeavours to make recruits believe they will never be perfect without an extraordinary amount of attention.

Germany can take care of itself without any prompting from strangers in art as in other affairs. But when so great an authority speaks of the decadence of the present time, we might assume that his words were applicable in other countries. Is it reasonable to conclude that in England we have retrograded in the course of half a century? In replying to such a question it is necessary to clear the ground from obscurities. Firstly, it should be remarked that artists of original genius must be excluded, for they cannot be produced by well-directed training alone, however excellent. TURNER, for example, was unique, and was able to make the Royal Academy illustrious until 1851. MULREADY, another able painter, was towards the close of his career suffering from defects of eyesight. LESLIE, too, was a great humourist. But can it be said that the majority of the Academicians, such as the CHALONS, UWINS, PICKERSGILL, LEE, PRESCOTT KNIGHT, C. W. COPE, were in any way superior to an equal number of Academicians at the present time? In water-colour art works of most of the men who exhibited fifty years ago would not sustain modern criticism. Architecture affords a still more remarkable test. COCKERELL and BARRY were men who at any time would have been recognised. But was Sir ROBERT SMIRKE or PHILIP HARDWICK an architect of surpassing attainments? Both were fortunate in their clients. But would much regret be expressed if the best works of either of them were doomed to demolition?

Fifty years ago there was enthusiasm concerning Gothic. Few men were forthcoming who were able to please the clerical amateurs, who were regarded as the sole arbiters of taste. DIGBY WYATT, EDMUND BARRY, F. P. COCKERELL, and one or two others suggested skill in using the Renaissance styles

if opportunities were offered. But anyone who will read the criticisms of the architectural room of the Royal Academy cannot help coming to the conclusion that in 1856 it was much inferior to the room which is about to be closed after the exhibition of 1906. It would now be unfair to point out some of the buildings which were erected in those days and which were admired as improvements and tokens of progress, for the majority of them now appear as only commonplace examples. When half a century has run its course possibly the buildings of our time may also be found defective in the eyes of the architects who will then rejoice in the smooth courses of practice.

There was an exhibition in Paris in 1855 in which architecture was represented mainly by men who had gained reputations, such as Sir CHARLES BARRY, DONALDSON, BUTTERFIELD, HARDWICK, RAILTON, T. H. WYATT, &c. The United States section contained a few paintings and pieces of sculpture, but not a single architectural design. If an exhibition were held next year in Paris the United States could send a collection of designs that would at least have equal value to those from any of the old countries. Indeed, it would appear that English skill in construction finds greater opportunities to display its power on the other side of the Atlantic. So long as American artists can stand in the front ranks we think all lamentations about the failure of the half-century have no real basis. Germany, no doubt, must live in a state of apprehension which may have an effect upon the arts—an effect that is not unlikely to be repeated in Japan. But experience does not prove that in other countries the work of students is as unsatisfactory as that described by Herr VON WERNER. The country in which pessimism has of late years found a congenial soil cannot be expected to yield those qualities which in the old days were supposed to be the characteristics of artists. Oratory like the State painter's is adapted to make an artist hopeless, and we cannot suppose that the works produced in the art school which he addressed will in the coming year be of a much higher character.

It is fortunate that in England high officials are not sufficiently respected to make young students believe that they speak as infallible authorities. If a man like Herr VON WERNER were to appear in an English art school, the demerits of his own work would be present to the imagination of the younger students. He would be supposed to be merely discharging his duty in a manner which would please his superiors. In any English town it would be realised that where there is unlimited competition there is a possibility of something superior being evolved. The effort to invent, which enables the Patent Office to gain large sums every year, is supposed to be as necessary in art as in manufactures. Machines and other objects which were admired for their utility fifty years ago are now obsolete. And for an artist of any kind to be successful, he must, in England at least, endeavour to produce something that can be considered as a genuine novelty. Only in architecture are repetitions and simple adaptations permitted. Germany also is rivalling England in inventiveness as applied to manufactures. If similar freedom could be tolerated in the arts, results would be obtained which would be suggestive of progress, although they might not satisfy the canons of a stickler for a rigid military system like Herr VON WERNER.

The National Trust for the Preservation of Places of Historic Interest and Beauty have collected the entire sum of 12,800*l.*, which was the purchase price of Gowbarrow Fell and Aira Force and Glen, at the Patterdale end of Ullswater. The property will now belong to the National Trust and will be available to the public. On August 9 this new recreation ground will be opened by the Speaker of the House of Commons. A keeper will be placed in charge of the estate.

A BUILDING DIRECTORY.*

PEOPLE are commonly disposed to accept things which are long established as if they were, like air or water, effects and causes which there is no need to investigate. The numerous Directories of the KELLYS are notable examples. They appear at regular periods, there are no names of authors and compilers appended, and the information is obtained without giving any trouble to those whose names are printed in the pages. It is not realised that a large number of men have to be employed; that every town and village in Great Britain has to be perambulated; that a mountain of manuscript must be accumulated before the printers can be set to work on a volume of 2,700 pages like the "Builders' Directory." Then the large book, in spite of all the labour and expense, is considered to have only a temporary use, and in a limited period a successor is demanded.

It may enable us to appreciate the value of a directory as representing the building trade of this country if we consider for a moment how much would be gained for humanity if, amidst the numerous excavations in Greece, a building directory for Athens or one of the other cities were exhumed. We cannot suppose it would be extensive. But what a light it would cast upon the history of architecture as well as the social condition of the Greeks. It might be imagined from the disquisitions of some theorists that Greek temples resembled MILTON's air-formed palace and rose like exhalations, or were created by a stroke of the wand of some famous architect. There is enough to show that there was a division of labour recognised by the Greek architects. A great deal of the hard work may, of course, have been done by slaves whose names would not appear in our imaginary directory. But we might from the names discover that even in quarries there were grades which were as jealous of each other as modern trade unions, and when the blocks found their way to the sites a succession of men worked upon each of them. From the number of architects existing in a modern town we can suppose that there is more or less demand for the services of all of them, for otherwise by the laws of political economy they would seek other employment. It would be interesting to know whether many men cared to follow the art in a Greek town. It seems doubtful whether there could be always commissions of much value. Temples and public buildings were not perpetually in course of erection; and the general opinion is that the private dwellings were not of a kind to bring credit to the owners by their beauty. It is true that the architects, like other Greeks, could subsist on coarse bread and a few olives. But a clever man would find that drachmas were more abundant in the practice of another art. The condition of architects and of builders also must remain a mystery to us unless something is forthcoming which resembles a modern directory. Unfortunately, the Greeks had not acquired the skill in business which could turn such aids to account and make them a necessity.

No less interesting would be a Mediæval building directory out of England, France or Germany. The mere addresses of the architects would be sufficient to reveal to us whether laymen were allowed to design as well as ecclesiastics, and when the former superseded their rivals. There have been speculations without limit on those subjects. Yet apparently there is no better chance of obtaining definite knowledge about the Mediæval system of erecting buildings than about that of the Greeks. We possess, of course, much information relating to Mediæval buildings. But it does not afford any clue as to the men who designed or the men who may have organised the operations of construction. Pious people have turned our ignorance

to account by declaring in sermons that the architects and builders were so modest and unworldly they avoided the temptation to give permanence to their names. Nobody would venture to say that the appearance of names many times in a directory is culpable. The interest which was acquired by the sketch-book of WILARS DE HONECOURT is evidence that people still feel an interest in architects as well as in buildings. The volume would, however, have been more satisfactory if WILARS was communicative about his own everyday work, and about the men he most admired or feared.

Thanks to MESSRS. KELLY, the New Zealander of MACAULAY, after he has sketched the ruins of St. Paul's, will be able to discover all the architects and the masters in the various branches of the building trade from 1870. The fact that in less than forty years ten editions of their Directory have been called for is evidence of the vitality there is in building as a business. In the pages we can realise the growth and alterations of building, and the large number of people who are engaged in the allied industries. It used at one time to be pointed out that the co-operation of forty men was required in order to produce a common pin. But judging by the number of trades represented in the Directory, it is not difficult to comprise the work of six or seven hundred trades in one building. In the old days the general builder could without going far for materials carry out all the work that was needed in a large structure by his own men. Now trades are subdivided, and even a sub-contractor calls in external aid. Foreigners are also engaged in giving aid to English construction, and the number of machines which take the place of men can hardly be realised. Formerly building was a comparatively simple art or craft. Now it is the most complex of all. And this peculiarity is exhibited in the pages of the Directory.

It is in the country towns we can best perceive the changes. We open the volume by chance at a page relating to a town of 5,000 inhabitants. It contains an architect, brick and tilemakers, builders and contractors, carpenters and joiners, gasfitters, land and estate agents, lime merchants, locksmiths and bellhangers, painters, paperhangers, decorators, plasterers, plumbers, slaters, a sanitary engineer and a surveyor. Probably work is derived from a great part of the surrounding country. Scotland seems to be no less eager to have masters for all classes of building. Ayr is a town of 31,000 inhabitants, and it has ten architects and the trades have numerous adherents. In Ireland also architecture and building have an abundance of representatives.

It would be interesting to know whether other laws, besides the possibility of obtaining commissions, determine the number of architects and builders in certain places. There are, for example, seventeen architects or firms of architects in Bournemouth; while Cromer, which golfers so much praise, and which seems to offer a profitable field, has only two. Clacton-on-Sea, which is quite a new place, has five, and Southend eighteen.

As a rule there is a great similarity between town and country in respect of building operations, materials and manufactures. But there are some curious differences which occasionally may be only of a nominal kind. Terra-cotta, for example, is largely used, and there would be no difficulty in placing an order in London. Yet the only firm described as manufacturers is found in the country. Bath geysers appear to be a London product. It seems strange that there should be only one firm of damp-course manufacturers in all England. Incandescent gas-fittings are largely employed, but incandescent light-fitting manufacturers are confined to a few provincial towns. It seems incredible that only one firm of iron and steel sash manufacturers should exist, and only one firm of mantelpiece manufacturers. Are the makers of pneumatic bells and pneumatic tubes confined to London? Other curious instances could be given, and they suggest the difficulties which the compilers of the Directory had to encounter. Some traders

* Kelly's Directory of the Building Trades throughout England, Scotland and Wales. Tenth Edition. (London: Kelly's Directories, Ltd.)

are ambitious to be considered as specialists. But it requires time before that policy is recognised by the public. What, for instance, is a "rock-worker?" To ordinary people it might appear as another word for a mason or a quarryman, the latter being the more reasonable, as the firm describes itself as "specialists in rock formation." On the other hand, some firms produce such a variety of things they must find it difficult to select under what trade they are represented.

We have referred to the Directory under its general aspects, as it reflects architecture and the subsidiary trades. As a guide to those who have to enter into correspondence with architects and all varieties of traders connected with building construction the work is invaluable. Messrs. KELLY know how brief is the term of a Directory's utility. For although some firms fortunately appear to be unaffected by time it is the fact that other firms are retiring and newcomers are appearing. Messrs. KELLY give the information up to the latest possible date, and as far as we have examined it, it is as exact as if a Government department with numerous auxiliaries had gathered the information. All that the compilers profess to give is to be found in the pages, and it would be well for students if all books for reference were equally trustworthy.

STAPLE INN.*

AS Mr. GREWGIOUS occupied chambers in it, there can be little doubt that Staple Inn was to be the scene of some important events in "Edwin Drood," if that fine fragment had been carried through to the last chapter. English literature has, in consequence, suffered a loss. DICKENS in his youth lived in Furnival's Inn on the opposite side of Holborn. But he was well acquainted with Staple Inn, of which he gave the following graphic description:—

Behind the most ancient part of Holborn, London, where certain gabled houses some centuries of age still stand looking on the public way as if disconsolately looking for the Old Bourne that has long run dry, is a little nook composed of two irregular quadrangles called Staple Inn. It is one of those nooks the turning into which out of the clashing street imparts to the relieved pedestrian the sensation of having put cotton in his ears and velvet soles on his boots. It is one of those nooks where a few smoky sparrows twitter in smoky trees, as though they called to one another, "Let us play at country," and where a few feet of garden mould and a few yards of gravel enable them to do that refreshing violence to their tiny understandings. Moreover, it is one of those nooks which are legal nooks, and it contains a little hall with a little lantern in its roof. To what obstructive purposes devoted, and at whose expense, this history knoweth not.

Staple Inn stood in need of the aid which DICKENS could impart to it, for it is the least romantic of all the inns of London. Among its tenants there was no man of eminence, with the exception of Dr. JOHNSON, who resided there for some months in 1759; and the very numerous names which appear in Mr. WILLIAMS'S book recall no incidents which are worth relating. Apparently among all the lawyers who resided in the chambers there is no record of one of them arriving at the Bench. Old Stow can only say of it that it was one of the nine Inns of Courts standing within the Liberties of London. But, he adds, "whereof so named I am ignorant; the same of late is for a great part thereof fair built, and not a little augmented."

The word "Staple" is the surname of an English family, and it might be supposed that, as in other cases, the inn was erected on their estate. But Mr. WILLIAMS considers that Staple Inn originally signified a customs house, and in particular a customs house for wool. As it would be near Holborn Bars or Gate, the position

might be considered as suitable for levying tolls on merchandise entering the City. In the fourteenth century Staple Inn had other rivals, and from a charter of EDWARD IV., dated 1463, it is evident that the staple which had been at Westminster was transferred to Leadenhall. During the changes lawyers and law students may have found abodes within the inn. But there seems to be no question that after 1463 it was recognised as an Inn of Chancery and as nothing else. The proprietors were known as Fellows or Grand Fellows forming "The Grand Company;" sometimes they are called Ancients instead of Fellows. Tenants who were not necessarily lawyers were accepted. According to Mr. WILLIAMS:—"The occupants of the inn were of three grades: first, those who were tenants and paid rent to the Grand Company; secondly, those who had been and intended to remain tenants, who had the right to be elected as members; thirdly, those holding freehold chambers, which qualified them for election as Fellows; these latter had a share in the proprietary rights over the hall, the land and the rented chambers."

There are occasional entries in the records concerning buildings, but we doubt if it would be possible to fix the dates of the different parts or to describe the circumstances under which they were erected. In 1584 we read of a ROBERT WILLETT at his own expense having substantially wainscoted the main hall, and he obtained a lease of certain premises which he had erected, including cellars and stairs, in which Mr. GREWGIOUS might be afterwards supposed to have had a share. In the agreements with tenants a cellar, or rather part of a cellar, went with a chamber. In all that relates to legal documents Mr. WILLIAMS is as conscientious and precise as Mr. GREWGIOUS would have desired. But such information will have greater interest for lawyers than for ordinary readers.

Although many old buildings had to succumb to the new conditions of business in the neighbourhood of Holborn, Staple Inn seemed to lead a charmed life. In 1842 the taxing masters in Chancery were able to persuade the Principal and Grand Fellows of the Society to rebuild two houses in the Garden Court, which were to be used as premises by the masters. To carry out the work the Society had to borrow 8,500*l.* The mortgage was finally repaid in 1884, and four days afterwards the inn was sold. The Office of Works purchased the part held by the taxing masters, and the remainder of the inn was sold to the Prudential Insurance Company. It is gratifying to know that the property was purchased with the intention of preserving it. Mr. WATERHOUSE took charge of the restoration of the front to Holborn, and the work was accomplished without affecting the picturesque appearance of the buildings. Among the illustrations is a reproduction of a measured drawing of the roof of the hall by Mr. PAUL WATERHOUSE. Although lofty buildings may now overshadow Staple Inn it still is able to assert itself as a survival of a kind of architecture which once prevailed in the streets of London. Mr. WILLIAMS'S book narrates all that is known of the place, and his volume will impart additional interest to the houses and hall.

The Foundation-Stone was laid last week of new municipal buildings, Bromley, of which Mr. R. F. Atkinson is architect. The contractor is Mr. G. F. Minter, of Putney, whose tender was 18,793*l.*

The Holborn Borough Council agreed last week that Messrs. Warwick & Hall, the Council's architects for the new municipal offices, be paid a commission of 5 per cent. on the total cost of the new buildings. The establishment committee reported that the architects' estimate of the cost was under 20,000*l.*; the land would cost 21,000*l.*, and furniture and additions 8,000*l.*—a total of 49,000*l.* Against this the Council has 10,000*l.* on hand on capital account, and the site in High Holborn and Goldsmith Street is estimated to realise 20,000*l.*, leaving 20,000*l.* to be provided. It was decided to borrow this sum from the London County Council.

ARCHÆOLOGY OF THE CANTERBURY DISTRICT.

THE annual meeting of the Kent Archæological Society was this year held in the Canterbury district, the proceedings, which commenced on July 17, extending over three days instead of the customary two. The following account is taken from the more extended report in the *South-Eastern Gazette* :—

The usual preliminary meeting for the transaction of business was held in the chapter-house of Canterbury Cathedral. Lord Northbourne, the president, in opening the proceedings, said they could congratulate themselves that once more it had fallen to their lot to meet in the cathedral city of Canterbury. There were very few places in the world more adapted and suited to a meeting of that Archæological and Antiquarian Society, for he might almost say that the history of Canterbury was the history of England. Since they last met there a good deal, no doubt, had happened. To refer to one matter alone that must be of great interest to all connected with antiquarian subjects, as they stood there they were within easy reach of four Saxon churches. One was St. Martin's, another the ancient church of St. Pancras, where investigations had been carried on for the last four years; then there was the church of St. Peter and St. Paul, which they hoped to visit the next day, and upon which they would hear a very interesting address; then lastly there was that ancient cathedral. In no place in England would they find four Saxon churches so full of interesting matter to the historian and archæologist. One circumstance that must be interesting to those who followed the history of the Anglican Church was that in the last ten years two English archbishops had found their place of residence in that city. This he believed was entirely without precedent since the days of the Reformation, and the circumstance must be of vital strength to the continuity of the English Church, in which they were all so interested.

The hon. secretary (Mr. Sebastian Evans) read the forty-ninth annual report, which reminded the members that sixteen years had elapsed since they last visited Canterbury. In the interval the ruins of the abbey church of St. Augustine and some of the adjacent monastic buildings had been excavated, and on this occasion they would be given the opportunity of visiting, not only these, but further excavations on the site of St. Pancras Chapel. The Society had contributed 55*l.* towards the expenses of these researches. The Society had to regret the loss by death of Mr. Burch Roshier, an energetic member of the Council for many years, and also local secretary for Deal and Walmer district. Two old members—the Rev. A. G. Hellicar and the Rev. J. Tillard—had also passed away. Mr. S. Wayland Kershaw, F.S.A., librarian of Lambeth Palace, had been elected an honorary member. Volume 27 of the "*Archæologia Cantiana*" was published in October; it had been paid for, and there now stood to the credit of the Society at the bankers a balance of 411*l.* 1*s.* 9*d.*

At the conclusion of the business meeting the Society was cordially welcomed to Canterbury by the Dean. In the course of his remarks he referred to the reparation of the Bell Harry tower of the cathedral now in progress. They were, he said, taking particular care—and the architect (Mr. Caroe) was famed in that particular work—to restore the tower as it was before, and not to introduce any new features into it. That they were endeavouring also to do in so far as any other reparation was concerned. What they were doing was simply to repair the ravages of the past. Another matter touched on by the Dean was the position of the high altar in the cathedral. If they looked at the maps available they would find that until about one hundred years ago the high altar—the altar of Christ as it was called—was placed on the lower platform, and where the high altar now was the archiepiscopal chair stood for all those centuries. From an archæological point of view they could not but join with him in regretting that that alteration was ever made. The speaker intimated that the Dean and Chapter desired to restore the high altar to its proper position, but whether they would be able to do so was, he said, another matter. They were experiencing the same difficulty as that Society met with in obtaining adequate sums of money for their purpose. The present were difficult times for acquiring money, and only 13,000*l.* out of the 15,000*l.* originally needed for the work they had undertaken had been subscribed, and he was sorry to say that at a very moderate estimate they would want at least 10,000*l.* more if the western tower, as well as the other parts of the cathedral, was to be put into a state of safety.

Lord Northbourne briefly acknowledged the Dean's welcome and the proceedings in the chapter-house terminated.

Canterbury Cathedral.

The cathedral was inspected under the leadership of Mr. St. John Hope. He conducted the party over the course followed by Erasmus on the occasion of his visit prior to the Dissolution and the demolition of the shrine, passing first from the nave to the south transept and thence in turn to the martyrdom, the crypt, the south aisle of the choir, the choir itself and the upper platform. He called attention, among other things, to the iron railings or screens which exist at different parts of the building, and pointed out that they represented old enclosures. They were therefore important as part of the history of the cathedral, and he hoped no one would ever agitate for their removal. The floors also were most important and should not be tampered with. With regard to the choir, Mr. Hope remarked that whether they admired the architecture or not, there could be no doubt that for dignity, spaciousness and general magnificence this part of the cathedral was very hard to beat, not only in this country, but also in Europe. He pointed out the original position of the high altar, and said he was delighted to hear what the Dean had said that morning as to the advisability of bringing it back to its proper place and of removing the archbishop's seat to the position it occupied in the days of Anselm. In the floor of the upper platform, Mr. Hope pointed out, were the stones which formed the steps of the shrine of St. Thomas. Conspicuous objects were the tombs of the Black Prince and Henry IV. With regard to the objects hanging over the former, he was convinced that they were merely the undertaker's furniture, and that they were never worn and probably never seen by the prince himself. On the tester or flat canopy over the tomb of Henry IV. the word "*Sovereign*" several times repeated was pointed out by Mr. Hope, and he expressed his belief that the "*S*" in this word was the origin of the "*SS*" chain which had puzzled antiquarians for so many years. The question of the identity of the bones which were held to be those of St. Thomas was touched on by Mr. Hope. The remains, he said, were exactly what they would expect from all they knew of Beckett's stature, while the skull showed a cleavage such as no doubt was caused by the sword blow by which the archbishop was killed.

At the end of the visitors' tour of inspection Mr. Hope was heartily thanked by the Dean for his able guidance and interesting description of the cathedral.

Before leaving the cathedral precincts the visitors, in two parties, were kindly entertained to tea, one party proceeding to the deanery as the guests of Dean Wace and the other going to the residence of the Archdeacon, Bishop Walsh.

Canterbury Churches.

On the second day there were alternative programmes. One party (the larger of the two) proceeded by brakes to Westgate Tower, the Church of Holy Cross, St. Nicholas Hospital, Harbledown; the Black Prince's Well, and St. Dunstan's Church, while the other went afoot to the Royal Museum, Eastbridge Hospital, the Grey Friars, St. Mildred's Church and the Poor Priests' Hospital.

Mr. St. John Hope described St. Nicholas Hospital for lepers at Harbledown. The hospital was founded in 1084, presumably by Archbishop Lanfranc. Of the original Norman building only two arches now remain, but in addition to these there are fourteenth-century windows well worthy of attention. The last of the lepers there, Mr. Hope stated, died in 1674.

St. Dunstan's Church possesses a very beautiful arcade of the Perpendicular period, and a fact of interest in connection with the church is that the head of Sir Thomas More is buried in the Roper vault. The relic was brought to Canterbury by Margaret Roper, a daughter of Sir Thomas, whose idea in securing it when it was set up on a pike on London Bridge (in accordance with custom after the execution), was that it should be buried with her on her death. Margaret Roper was buried at Chelsea, but the head, contrary to her instructions, was left at Canterbury, and remains there to this day. Mr. St. John Hope, speaking of the architecture of the church, said that from a casual acquaintance with it he was inclined to think it was of Saxon origin like that of St. Mildred's.

Eastbridge Hospital was founded in 1180 for the benefit of poor pilgrims visiting the shrine of St. Thomas, a feature of interest being the crypt. Of the Franciscan house known as the Grey Friars, only a small building now remains.

This establishment dates back to 1270. Traces of Saxon work in the outer walls of St. Mildred's Church are plainly visible, notably in the south-western corner. Among the monuments in the church is a tablet in memory of Thomas Cranmer, who was a grandson of the archbishop of that name, while a small niche is to be seen on one of the pillars of the arcade on the north side, which is supposed to have a connection with Caxton, to whom we owe the introduction of the printing press into this country.

At St. Augustine's College the members were received by the sub-warden (the Rev. R. J. E. Boggis) in the unavoidable absence of the warden (Dr. Murray). Mr. Boggis gave a lucid account of the history of the monastery which once existed here. They traced it back, he said, through thirteen centuries to the time of Augustine himself. When he arrived at the end of the sixth century he brought with him forty companions, who were commonly described as monks. That was not quite correct, for some were regulars and some were seculars. First of all he founded the cathedral on land given him by King Ethelbert, and there he fixed the habitation of his secular clergy; but it was not to be expected that the regulars, or monks, would dwell together with the seculars, and so King Ethelbert gave him another tract of land on which to erect other buildings. The cathedral was founded in 597, and St. Augustine's monastery was founded in the following year. Mr. Boggis pointed out the positions occupied by the original conventual buildings, of which, he said, nothing now remained except, perhaps, a piece of wall, which might be original work. The wall of the great abbey church still existing was Norman. Within the site of that church the first ten archbishops were buried, as also were King Ethelbert, Queen Bertha and other kings and queens of later times. Mr. Boggis conducted the party round the buildings of the college, and gave an account of the foundation of this institution by the purchaser of the property, the late Mr. Beresford Hope. Among other facts of interest mentioned by the speaker in his account of the history of St. Augustine's was that King Henry VIII. founded a residence for himself there after the dissolution of the monastery. Anne of Cleves was received there when she came to see her future spouse for the first time. Later, good Queen Bess stayed there a fortnight; Charles I. entertained his bride at St. Augustine's, and Charles II. stopped there at the time of the Restoration.

Leaving the college buildings the party proceeded to the ruins of the chapel of St. Pancras and other buildings of which walls have been uncovered in the abbey field. The remains were described by Mr. St. John Hope. With the exception of the Roman church discovered some years ago at Silchester, and part of St. Martin's Church, St. Pancras was, he said, the oldest church of which any trace had been found in this country. The church belonged to a very early type indeed, the materials used throughout being smashed Roman remains from some building which had probably existed in the neighbourhood, which also yielded certain stone pillars. There was a triple chancel arch, only found in the very earliest church, such as Lyminge, built in 627, the little church built by Ethelbert in 604, of which some remains had been found at Rochester Cathedral and Reculver. The east end of St. Pancras was originally apsidal in form, though altered later. This chapel, he had no doubt, served St. Augustine and his monks while the great abbey church was being built. The original plan was altered, he pointed out, before the building had proceeded very far, three small chambers which were called porches being added. Each of these contained an altar.

Mr. St. John Hope next described the remains of the great church of St. Peter and St. Paul. How long the church of St. Augustine stood they did not know; but immediately to the east of it Ethelbert's successor, Eadbald, built another in honour of the Blessed Virgin. Thus there were three churches all in a row, that of St. Peter and St. Paul, that of Our Lady and that of St. Pancras. The Abbot Scotland cleared away the whole of Eadbald's church to erect the building which he had planned, with an apsidal termination and a great crypt with three chapels below; and to Scotland they owed all that now remained on that site, with the exception, possibly, of one fragment of Eadbald's church. Quite late in the fifteenth century there was an extension of Scotland's church eastwards, but nothing now remained of the superstructure of either building.

Concluding, Mr. Hope made an appeal for further funds to enable the trustees of the property to complete their investigations. He said that 300*l.* was required, and men-

tioned that three sums of 10*l.* were promised by members of the Society towards the amount on the previous day.

St. Martin's Church.

Progress was next made to St. Martin's Church. Here the Rev. G. M. Livett acted as guide. Both from the point of view of archæology and history the church, he remarked, was full of interest. St. Martin's, indeed, was a battle ground of archæological questions. There was no doubt a church on that spot, or the remains of a church, in which Augustine celebrated the holy rites. The Venerable Bede, the historian of the seventh century, told them that a church was built there in the time when the Romans were in the land, and that it was dedicated to St. Martin. The great question was whether any part of the church in which St. Augustine himself worshipped, and in which it was said King Ethelbert was baptized, now remained. There were two distinct kinds of architecture to be noted—the architecture of the nave and the architecture of the chancel. The chancel was composed almost entirely of brick, roughly put together, very much like that of St. Pancras, and there could be little doubt, he thought, that the two churches were of much the same date as other churches they knew of which were built in the seventh century, viz. Lyminge, Reculver and the church of which they had the foundations at Rochester. He did not think, however, that the chancel arch there was triplet, because there was hardly room there for that arrangement. The nave was built of Kentish rag, with a binding course of Roman brick inserted at intervals. That style of building was put up in the Saxon period, Roman material being at hand. The question was whether the nave was built prior to the chancel, or the chancel prior to the nave. He had spent a whole week in examining the building, and he was of opinion that the chancel, to which there were later additions, was the earlier of the two portions of the church. Mr. Livett indicated the evidence for his belief, but he admitted that two openings in the wall at the west end of the nave were undoubtedly Romanesque, a fact which suggested that the nave was built in pre-Saxon days. They must, Mr. Livett added, keep their minds still open on the whole question, because it had not yet been completely thrashed out.

Mr. St. John Hope said he differed from Mr. Livett, his opinion being that the nave was the older part of the church. The evidence for his opinion existed in the two openings in the wall at the west end, where he found alternate slabs of stone and tile buried in pink mortar, similar to the work of the so-called pharos, or lighthouses, at Dover, which was undoubtedly Roman. The nave then was, as he held, of very late Roman and pre-Saxon construction.

The third day's proceedings took the members to the villages of Ickham, Wingham, Barfreston and Patricbourne.

Ickham Church.

The Rev. Canon Nisbet, the rector, gave a description of Ickham Church. The original structure was, he said, according to Mr. Caroe, erected in the first half of the twelfth century, and probably consisted of a nave, western tower, transepts and apse, or possibly three apses. The original church ended where the present chancel began. According to Scott Robertson there was a church here in 1086, but the western door of the tower was the oldest relic, and that could be scarcely considered of earlier date than the twelfth century. The church was restored when the aisles were added to the nave, about the end of the twelfth century. There were four bells, and, besides the names of the churchwardens, there was inscribed on them the following prayer:—"Lord Jesus Christ, receive each soul for whom this bell shall toll." The register of the church dated from 1557, and in 1670 there was an entry of 5*l.* 18*s.* 3*d.*, "collected towards the redemption of Englishmen captured and reduced to slavery by the Turks." In the south transept there was the tomb of a knight of about the middle of the fourteenth century, but there was a doubt as to whose tomb it was. The ancient chest placed in the north transept had a semicircular lid, hollowed out of the trunk of a single tree. It was originally a chest in which was kept the belongings of the chantry, but this was abolished 400 years ago.

Wingham Church.

Wingham Church was briefly described by the Rev. J. M. Fox, B.A., the rector. The only remains of the first stone church, which existed in the tenth and eleventh centuries, were in the south wall and the chancel, where the clergy seats had been, but the floor had not been raised.

The chancel was largely built in the Decorated style, but the nave was of the Perpendicular period. Archbishop Peckham made the church a collegiate church in 1282. He believed much damage was done to the building at the Reformation, and he was afraid he must say of the beauties of its architecture that "the glory has departed." The church lost all its properties when Henry VIII. disestablished the monasteries, and whatever effect disestablishment and disendowment might have in the country, it would make no difference at Wingham, for the church was already disendowed.

The Rev. G. M. Livett called attention to the gravestone of 1271 in the chancel, remarking that there was not another in existence in the country.

Barfreston Church.

At Barfreston, the magnificent church, with its fine doorway built in the Norman style, was inspected. The Rev. G. M. Livett, in describing this church, said it was unique in the wealth and the peculiar method of the use of its ornament. The church was restored in 1840, but Hussey gave a most clear account of what was done at that time, so that they were able to follow its previous history, and he hoped all members of the Society would, in cases of restoration, arrange in the same way to give particulars of the new works carried out and the old work supplanted. The church was very small, 24 feet by 16 feet 8 inches, and it dated from late in the twelfth century. He called attention to the zigzag work over the chancel arch and to the dog-tooth decoration, supposed to be thirteenth-century ornament, round the sides. It was the wealth and richness of the ornament which caused him to believe the columns came from elsewhere and were not originally intended for the church. Nowhere else was there to be seen a church with a string-course which had so many different kinds of patterns, and the work generally was suggestive that the materials intended for, or perhaps used in, some other building near by, had been brought here and built up into the church. As an instance he called attention to the wheel window at the east end, where one of the mullions was of wood, the others being of stone, and his theory was that this wooden mullion was made in place of a stone one which had been broken. This, in his opinion, showed that the stone was not cut on the spot. Hussey had hazarded the opinion that the materials came from Hackington, where in 1185 Archbishop Baldwin had projected the building of a monastery, which was suppressed at his death the same year.

Patricxbourne Church.

On arrival at Patricxbourne the party were entertained to tea at the Rectory. Afterwards the Rev. Hubert Knight gave a short description of the church, the most attractive feature of which is the Norman doorway on the south side. The doorway is highly decorated, and above the arch is a niche of 1170 date, although the door itself is supposed to be of a later time.

The Rev. G. M. Livett explained that an earlier church than the present one is mentioned at Patricxbourne in Domesday Book, but the existing building was erected in the latter half of the twelfth century. There was only one other example in the country of the porch and tower being in one.

The Rev. Hubert Knight mentioned that the glass in the chancel windows was collected abroad by the Marquis of Cunningham, and was, he believed, Flemish, but he questioned whether it was all ecclesiastical.

Mr. Livett said the chancel arch was apparently of 1250 date, and it was possible that here they had a singular instance of a church built at that date with only one narrow aisle.

From Patricxbourne the members drove back to Canterbury and dispersed.

IONA CATHEDRAL.

A CORRESPONDENT of the *Scotsman*, in an article on "The Isle of Desolation," gives the following description of the present state of the cathedral:—

Iona is all of the past. Its golden age lies far behind. The present is but a desolation. One mighty spirit broods over it all, and the voyager who stays but an hour departeth meek and humble. For how poor and how wretched is the present viewed in the light of that radiant past. There above the shore, in the hearing of the never-resting sea, rises four-square to all the winds the great sanctuary which

the generations of old reared in honour of the mighty dead and to the glory of God. They who laboured at the work built not for a day. While the darkness brooded over the rest of Caledonia, here the hand of the artist wrought and impressed on the hard stone the visions of beauty which haunted him. And the west wind blowing from the sea passed on to the mainland consecrated by the music of litanies and chanted Psalms. An age of poverty did this—erected those vaulted aisles and mighty arches, those cloisters and chapels. Yes, but we in an age of abounding prosperity cannot find it in our hearts to roof them and preserve them from destruction. Truly it is humbling to stand there and think—think how abounding faith out of its poverty did build; how the zeal of the reformers left the great temple to become the nesting-place of the owls and the bats; how in the roofless fane for generations the effigies of abbots and chiefs, and the delicate tracery on pillar and window were slowly defaced by driving rain and hailstone; and how, when through the pious deed of the late Duke of Argyll, the sanctuary is again restored to the Church of Scotland and to the people of Scotland, that the Church and the nation might build again the waste place. After some years it stands there still, neither a ruin nor yet restored, neither wholly neglected nor yet cared for, neither a place made worthy of worship nor yet wholly without the rites of worship. The nave of the cathedral is still grass-grown and crumbling; the wall of the nunnery is still propped up with unsightly beams; the chancel is still chaotic and unfurnished; the cloisters are still crumbling in decay—for an age of poverty did rear that which an age of wealth cannot provide the means to re-roof. He who visits Iona will see his own generation lying in the shadow. He may approach the sacred isle self-satisfied; he will leave it humbled.

If any spot should be dear to a nation, so dear that nothing should be counted too great to do it honour, then the very dust of Iona should be precious to Scotland. There its history did dawn, there the foundation of its civilisation was laid, there the things that we know had their beginning, there the seed of all that is great and good among us was first sown in our barren soil. It comes to us all, as we stand on the beach where the indomitable man landed, by the great boulder his feet first touched and which bears his name. But his shrine stands there half-roofed, witnessing to the manner in which we cherish the memories of those to whom we owe our very being. Truly that crumbling sanctuary condemns our nation. Here for centuries the nation garnered its honoured dead, and whoever wrought deeds of daring or chivalry; thither up the narrow sound the dark galleys brought their dead, and with the sound of weeping they were laid in Reidhlig Orain. There forty-eight kings that ruled once in Scotland (not all kings of but in Scotland), four kings of Ireland, eight kings of Norway and one king of France sleep together in peace, their battles all forgot. Last of all was brought thither the good Duncan, that his resting-place might compensate his woe. The man who can stand there and contemplate Iomaire-nar-Righ—the Ridge of the Kings—without a stirring of the heart is not to be envied. "Are ye become as we, are ye like unto us?" is the thought that rises in the heart. In their day nations moved at their will, and now their graves are nameless on this crowded ridge. (A century hence, what of us, O gentle reader?) For five centuries a nation in the making sent forth its galleys, carrying thither "their dark freight, a vanished life;" chiefs came hither to be blessed; here the first king in Scotland was ordained and crowned (the first, at least, of whom we know); from hence the serried peaks of the Coolins to the north and Cruachan to the east caught the gleam of the light and flashed it over the land. And to-day a nation to whose care this shrine has been committed suffers it to stand half-roofed, eloquent with the imploring beauty of decay, a monument of national degeneracy.

A Committee has been appointed to commemorate the important work accomplished at Manchester Cathedral by the late Dean Maclure. Among his improvements may be mentioned the rearrangement of the churchyard, the addition of new buildings and the opening of the Jesus Chapel, now used as the Consistory Court. The proposal is to lay down a large brass, with a full-length portrait of the Dean and a suitable inscription. Mr. Basil Champneys, architect of the recent additions to the cathedral, has volunteered to assist the committee in the settlement of the design and in selecting a suitable position for the memorial.

NOTES AND COMMENTS.

A FEW weeks ago, it will be remembered, the old parish church of Preston, near Brighton, suffered a large amount of injury from a fire. A report has been prepared on the restoration by Mr. P. M. JOHNSTON. It appears that the tower arch had been considerably injured, but the most serious damage was the destruction of the nave roof. Mr. JOHNSTON proposes to renew it exactly upon the old designs, and to erect a plain and solid roof of the thirteenth-century type. The gallery, it is suggested, might well give place to something more in keeping with the ancient church. If this were done the light could be obtained from the western windows, and the tower arch would not be hidden. The tower floors will now be replaced and the bell cage reinstated. The old paintings ranked amongst the most interesting in Sussex. Mr. JOHNSTON proposes to deal with them in the most careful way in order that their peculiar character may be clearly suggested. The vicar and vestry were satisfied with the report, and requested Mr. JOHNSTON to prepare plans, specifications and quantities for the restoration. The church was insured, but the money has not as yet been paid.

A RECOMMENDATION has been given by the French Budget Commission which may puzzle people unacquainted with French ways. According to it the bestowal gratuitously of any article produced in the national manufactories is to be henceforth prohibited. As in other continental States, there are several national manufactories in France. But it is believed that the proposal refers only to the beautiful pottery which is made at Sèvres. It is well known that examples of the art are presented to kings and great people who have displayed friendship towards France. It is to be assumed the new law would not in any way affect similar gifts. But, in addition, large numbers are presented to Frenchmen. The ambition to be enrolled in the Legion of Honour has been the cause of many public acts which have been advantageous to France. But once entered, promotion becomes slow. Frenchmen like to be rewarded in some way or another, and among the varied products of Sèvres it is always possible to find something which will be accepted as an equivalent for political and other services. Ministers while in office are expected to give entertainments. A singer from the Opera House, an actor or a danseuse would profess to be honoured to take part in them. But it is understood that they are not to receive *louis* for their services, and are to be satisfied with a present from Sèvres instead. In the majority of cases the presents do not become heirlooms, for they are sold to the highest bidder. When it is necessary to comply with such conditions, the artists and potters of Sèvres cannot be expected to do more than to accept the conditions of the market and to produce work that, if showy, will be cheap. Indeed, the wonder is that so excellent a standard has been preserved. If the law is accepted, fictile art may be the gainer, but much dissatisfaction must arise unless some other kind of reward is discovered—such as a supplementary Legion of Honour.

WE sometimes hear of unknown benefactors who bestow gifts on institutions or individuals. But such persons should be careful in the arrangements they make whenever they wish to apply their money to the laudable purpose of building. In 1902 a lady made her will, which included the following bequest:—"I give the sum of 20,000*l.* towards the rebuilding and equipment, to the satisfaction and under the direction of my executors, of the Birmingham and Midland Hospital for Women, the enlargement of which has been recommended, and which charity I have long desired to benefit." Such is the secrecy in such matters that the lady and her advisers were not aware of the arrangements for rebuilding the hospital, nor were the hospital authorities aware of the money which they could apply. Three years afterwards she died. At that time the

building was nearly complete, with the exception of plastering, painting, furnishing and equipment. A dispute arose over the terms of the will. Mr. Justice KEKEWICH held that the gift was for a specified object. If the words "to the satisfaction of my executors" stood alone, he thought it would be competent for the executors to say that what had been done in the matter of rebuilding and equipment, though without their having been consulted or made acquainted with it, might be paid for to the extent of 20,000*l.*, less duty, out of assets. But the testatrix provided that the rebuilding and equipment, towards which the 20,000*l.* was to be devoted, must be done under the direction of the executors. That did not mean that the executors must act as clerks of works or superintending architects, but he thought that it postulated general guidance or control. On the hospital 37,915*l.* had been expended before the death of the testatrix. After a long discussion it was decided that the case should stand over until next sittings. But Mr. Justice KEKEWICH suggested that it would be in the interest of all parties if the hospital would accept one-half the bequest, the remainder being handed over to the next-of-kin. The litigation shows the folly of making people responsible for the direction of works who, although trustworthy as executors, may be ignorant of building matters.

THE subject assigned this year in the competition among architectural students for the Prix de Rome was "Un Collège de France." It was to express by its exterior aspect, which was to be at once monumental and elegant, the character of the teaching which the State so liberally dispenses in literature, the history of art and in science. It was to contain among its features a *cour d'honneur*, in which was to be placed a statue of FRANCIS I., an amphitheatre, a library, classrooms, &c. The coveted prize has been awarded to M. BONNET, whose design has the merit of avoiding all revolutionary ideas. M. ABELLA obtains the premier second Grand Prix and M. MOREAU the deuxième second Grand Prix. As is usual there is dissatisfaction with the awards. But it must be allowed that the present year does not seem to be productive of great architects if the whole of the designs are to be taken as a test.

THE removal of a house from one part of a street or town to another is not unusual. But to transport a very large mansion for a distance of about 1,200 miles, and at a cost of at least 6,000*l.*, is not an everyday operation. Mr. J. M. LONGYEAR owned a stone mansion which overlooked Lake Superior at Marquette, in Michigan. He resolved to remove to Brookline in Massachusetts, and decided that the house should accompany him. It was not removed *en masse*; the parts were taken down in sizes that could be lifted by hand derricks, and the carved moulded work was protected by crates. No less than 190 railway freight cars or trucks were required. The operations began on August 1, 1903, and the house was occupied by the owner in its new position on April 15, 1906. The removal cost about one-tenth of the original contract price for the house. The operations were under the charge of Mr. D. F. CHARLTON, of Marquette. So costly an experiment testifies to the value of associations, and henceforth the Americans cannot be accused of having no domestic sentiment.

THE PROGRESS OF SCIENCE.

ON Wednesday the annual meeting of the British Association was commenced. The president, Professor E. Ray Lankester, M.A., LL.D., D.Sc., F.R.S., F.L.S., Director of the Natural History Departments of the British Museum, delivered the opening address. He said:—It is, first of all, my privilege to thank you for the distinguished honour you have done me in electing me President of this great scientific Association—an honour which is enhanced by the fact that our meeting this year is once more held in the venerable city of York, in which seventy-five years ago the British Association for the Advancement of Science held its first meeting.

It is a great pleasure to me to convey to the Lord Mayor and the dignitaries and citizens of York your hearty thanks for the invitation to meet this year in their city. It seems to have become a custom that the Association should be invited at regular intervals to assemble in the city where it took birth and to note the progress made in the objects for the furtherance of which it was founded. A quarter of a century ago we met here under the presidency of that versatile leader in public affairs—Sir John Lubbock, now Lord Avebury. That occasion was the jubilee—the fiftieth anniversary—of the Association.

Lord Avebury on that occasion gave as his presidential address a survey of the progress of science during the fifty years of the Association's existence. He had a wonderful story to tell, and told it with a fulness which was only possible to one of his wide range of knowledge and keen interest in the various branches of science. If I venture on the present occasion to say a few words as to the great features in the progress of our knowledge of nature during the last twenty-five years, it will be readily understood that the mere volume of new knowledge to be surveyed has become so vast that a full and detailed statement such as that which Lord Avebury placed before the Association at its jubilee is no longer possible in a single address delivered from the President's chair.

Let me ask you, before we go further, to take for a few moments a more personal retrospect, and to think of the founders of this Association, then of the great workers in science who were still alive in 1881, when last we met here, and have since gone from among us, leaving their great deeds and their noble enthusiasm to inspire now and for all future time those who have vowed themselves to the advancement of science in this realm of Britain.

There must be some here who had the privilege of personal acquaintance with several of the men who founded this Association in York seventy-five years ago. I myself knew Professor John Phillips, Sir Charles Lyell, Sir Roderick Murchison, Sir David Brewster, Dr. Whewell and Mr. Harcourt of Nuneham. All these fathers of our Association had passed away before our last meeting in York. And now, in the quarter of a century which has rolled by and brought us here again, we have lost many who took an active part in its annual meetings and were familiar figures in the scientific world of the later Victorian period. Huxley and Tyndall, Spottiswoode and Cayley, Owen and Flower, Williamson and Frankland, Falconer and Busk, Prestwich and Godwin Austen, Rolleston and Henry Smith, Stokes and Tait and many others are in that list, including one whose name was and is more often heard in our discussions than any other, though he himself never was able to join us—I mean Charles Darwin. Happily some of the scientific veterans of the nineteenth century are still living, if not with us in York. Sir Joseph Hooker, who visited the Antarctic with Ross in 1839, is still hale and hearty, and so are Alfred Russel Wallace, Lord Kelvin, Sir William Huggins and many others who were already veteran leaders in scientific investigation when last we visited York; they are still active in thought, observation and experiment.

In attempting to give an outline of the advancement of science in the past twenty-five years I think it is necessary to distinguish two main kinds of advancement, both of which our founders had in view. Francis Bacon gave the title "Advancement of Learning" to that book in which he explained not merely the methods by which the increase of knowledge was possible, but advocated the promotion of knowledge to a new and influential position in the organisation of human society. His purpose, says Dean Church, was "to make knowledge really and intelligently the interest, not of the school or the study or the laboratory only, but of society at large." This is what our founders also intended by their use of the word "advancement." So that in surveying the advancement of science in the past

quarter of a century we of the British Association must ask not only what are the new facts discovered, the new ideas and conceptions which have come into activity, but what progress has science made in becoming really and intelligently the interest of society at large? Is there evidence that there is an increase in the influence of science on the lives of our fellow-citizens and in the great affairs of the State? Is there an increased provision for securing the progress of scientific investigation in proportion to the urgency of its need, or an increased disposition to secure the employment of really competent men trained in scientific investigation for the public service?

After considering various branches of science as they appear to a naturalist, the President spoke of the duties of Government to encourage special studies.

Whilst I have been able, though in a very fragmentary and incomplete way, to indicate the satisfactory and, indeed, the wonderful progress of science since this Association last met in York, so far as the making of new knowledge is concerned, I am sorry to say that there is by no means a corresponding "advancement" of science in that significance of the word which implies the increase of the influence of science in the life of the community, the increase of the support given to it, and of the desire to aid in its progress, to discover and then to encourage and reward those who are specially fitted to increase scientific knowledge, and to bring it to bear so as to promote the welfare of the community. I am speaking on a privileged occasion to a body of men who are met together for the advancement of science, and I claim the right to say to them, without offence to the representatives of institutions which I criticise, what is in my mind.

It is unfortunately true that the successive political administrators of the affairs of this country, as well as the permanent officials, are altogether unaware to-day, as they were twenty-five years ago, of the vital importance of that knowledge which we call science, and of the urgent need for making use of it in a variety of public affairs. Whole departments of Government in which scientific knowledge is the one thing needful are carried on by ministers, permanent secretaries, assistant secretaries and clerks who are wholly ignorant of science, and naturally enough dislike it since it cannot be used by them, and is in many instances the condemnation of their official employment. Such officials are, of course, not to be blamed, but rather the general indifference of the public to the unreasonable way in which its interests are neglected.

A difficult feature in treating of this subject is that when one mentions the fact that Ministers of State and the officials of the public service are not acquainted with science, and do not even profess to understand its results or their importance, one's statement of this very obvious and notorious fact is apt to be regarded as a personal offence. It is difficult to see wherein the offence lies, for no one seeks to blame these officials for a condition of things which is traditional and frankly admitted.

This is really a very serious matter for the British Association for the Advancement of Science to consider and deal with. We represent a line of activity, a group of professions which are in our opinion of vital importance to the well-being of the nation. We know that those interests which we value so highly are not merely ignored and neglected, but are actually treated as of no account or as non-existent by the old-established class of politicians and administrators. It is not too much to say that there is a natural fear and dislike of scientific knowledge on the part of a large proportion of the persons who are devoid of it, and who would cease to hold, or never have held, the positions of authority or emolument which they now occupy were scientific knowledge of the matters with which they undertake to deal required of them. This is a thorny subject, and one in which, however much one may endeavour to speak in general terms, it is difficult to avoid causing personal annoyance. Yet it seems to me one which, believing as I do that it is of most urgent importance, it is my duty as your President to press upon the attention of the members of the British Association. Probably an inquiry into and discussion of the neglect of science and the questionable treatment of scientific men by the administrative departments of Government, would be more appropriate to a committee appointed by the Council of the Association for this purpose than to the presidential address.

At the same time I think the present occasion is one on which attention should be drawn in general terms to the fact that science is not gaining "advancement" in public and official consideration and support. The reason is, I

think, to be found in the defective education, both at school and university, of our governing class, as well as in a racial dislike among all classes to the establishment and support by public funds of posts which the average man may not expect to succeed by popular clamour or class privilege in gaining for himself—posts which must be held by men of special training and mental gifts. Whatever the reason for the neglect, the only remedy which we can possibly apply is that of improved education for the upper classes, and the continued effort to spread a knowledge of the results of science and a love for it amongst all members of the community. If members of the British Association took this matter seriously to heart they might do a great deal by insisting that their sons and their daughters, too, should have reasonable instruction in science both at school and college. They could, by their own initiative and example, do a good deal to put an end to the trifling with classical literature and the absorption in athletics which is considered by too many schoolmasters as that which the British parent desires as the education of his children.

It is more agreeable to me not to dwell further on the comparative failure of science to gain increased influence and support in this country, but to mention to you some instances on the other side of the account. As long ago as 1842 the British Association took over and developed an observatory in the Deer Park at Kew, which was placed at the disposal of the Association by Her Majesty the Queen. Until 1871 the Association spent annually a large part of its income—as much in later years as 600*l.* a year—in carrying on the work of the Kew Observatory, consisting of magnetic, meteorological and physical observations. In 1871 the Association handed over the observatory to the Royal Society, which had received an endowment of 10,000*l.* from Mr. Gassiot for its maintenance, and had further devoted to that purpose considerable sums from its own donation fund and Government grant. Further aid for it was also received from private sources. From this observatory at last has sprung, in the beginning of the present century, the National Physical Laboratory in Bushy Park, a fine and efficient scientific institution, built and supported by grants from the State, and managed by a committee of really devoted men of science who are largely representatives of the Royal Society. In addition to the value of the site and buildings occupied by the National Physical Laboratory, the Government has contributed altogether 34,000*l.* to the capital expenditure on new buildings, fittings and apparatus, and has further assigned a grant of 6,000*l.* a year to the working of the laboratory. This institution all men of science are truly glad to have gained from the State, and they will remember with gratitude the statesmen—the late Marquis of Salisbury, the Right Hon. Arthur J. Balfour, Mr. Haldane, and others—as well as their own leaders—Lord Rayleigh, Sir William Huggins, and the active body of physicists in the Royal Society who have carried this enterprise to completion. The British Association has every reason to be proud of its share in early days in nursing the germ at Kew which has at length expanded into this splendid national institution.

I may mention also another institution which, during the past quarter of a century, has come into existence and received, originally through the influence of the late Lord Playfair (one of the few men of science who has ever occupied the position of a Minister of the Crown), and later by the influence of the Right Hon. Joseph Chamberlain, a subsidy of 1,000*l.* a year from the Government and a contribution of 5,000*l.* towards its initial expenses. This is the Marine Biological Association, which has a laboratory at Plymouth, and has lately expended a special annual grant, at the spontaneous invitation of His Majesty's Treasury, in conducting an investigation of the North Sea in accordance with an international scheme devised by a central committee of scientific experts.

One of the most solid tests of the esteem and value attached to scientific progress by the community is the dedication of large sums of money to scientific purposes by its wealthier members. We know that in the United States such gifts are not infrequent; they are rare in this country. It is therefore with especial pleasure that I call your attention to a great gift to science in this country made only a few years ago. Lord Iveagh has endowed the Lister Institute, for researches in connection with the prevention of disease, with no less a sum than a quarter of a million pounds sterling. This is the largest gift ever made to science in this country, and will be productive of great benefit to humanity. The Lister Institute took its origin in the surplus of a fund raised by Sir James Whitehead when

Lord Mayor, some sixteen years ago, for the purpose of making a gift to the Pasteur Institute, in Paris, where many English patients had been treated, without charge, after being bitten by rabid dogs. Three thousand pounds was sent to M. Pasteur, and the surplus of a few hundred pounds was made the starting-point of a fund which grew, by one generous gift and another, until the Lister Institute on the Thames Embankment at Chelsea was set up on a site presented by that good and high-minded man, the late Duke of Westminster.

Many other noble gifts to scientific research have been made in this country during the period on which we are looking back. Let us be thankful for them, and admire the wise munificence of the donors. But none the less we must refuse to rely entirely on such liberality for the development of the army of science, which has to do battle for mankind against the obvious disabilities and sufferings which afflict us and can be removed by knowledge. The organisation and finance of this army should be the care of the State.

It is a fact which many of us who have observed it regret very keenly, that there is to-day a less widespread interest than formerly in natural history and general science outside the strictly professional arena of the school and university. The field naturalists among the squires and the country parsons seem nowadays not to be so numerous and active in their delightful pursuits as formerly, and the mechanics' institutes and lecture societies of the days of Lord Brougham have given place, to a very large extent, to musical performances, bioscopes and other entertainments, more diverting, but not really more capable of giving pleasure than those in which science was popularised. No doubt the organisation and professional character of scientific work are to a large extent the cause of this falling off in its attraction for amateurs. But perhaps that decadence is also due in some measure to the increased general demand for a kind of manufactured gaiety, readily sent out in these days of easy transport from the great centres of fashionable amusement to the provinces and rural districts.

In conclusion, I would say a word in reference to the associations of our place of meeting, the birthplace of our Society. It seems to me not inappropriate that a society for the advancement of science should have taken its origin under the walls of York Minster, and that the clergy of the great cathedral should have stood by its cradle. It is not true that there is an essential antagonism between the scientific spirit and what is called the religious sentiment. "Religion," said Bishop Creighton, "means the knowledge of our destiny and of the means of fulfilling it." We can say no more and no less of science. Men of science seek, in all reverence, to discover the Almighty, the Everlasting. They claim sympathy and friendship with those who, like themselves, have turned away from the more material struggles of human life, and have set their hearts and minds on the knowledge of the Eternal.

WINCHESTER CATHEDRAL.

ADDITIONAL discoveries of the unsatisfactory condition of the fabric of Winchester Cathedral have been made. Immediately following one of the services last week a loud crash was heard in the building, and soon afterwards it was discovered that the pointing of a joint in one of the ribs of the vaulted ceiling over the south aisle of the nave had fallen. The debris was composed of slate, brick and oyster shells, which had been used as packing by the original builders. The cause of the fall is believed to have been the concussion occasioned by the work of relaying the roof with lead, but examination showed that a serious weakness existed. The outer walls have been torn away from the vaulting, which has caused fractures in the spandrels of the roof. This points to either a settlement of the building or the thrust of the vaulting forcing the outer wall outwards. The outer wall is 4 inches out of the perpendicular to the height of 15 feet. Temporary measures have been taken to meet the situation pending the reception of a report on the state of the south aisle. It is anticipated that the south wall will have to be underpinned and the whole of the pockets of the wall rebuilt. It is estimated that the cost of this work will be about 5,000*l.* The work at the east end is progressing favourably. With the appeal for 30,000*l.* at present made and the west front in a decayed condition, this fresh trouble has caused much concern to the cathedral authorities.

HUNSDON.*

THE derivation of the name Hunsdon is uncertain. Salmon says:—"This village hath a noble situation upon a rising ground of gravel overlooking the meadows. The 'don,' or hill, if not named from some Saxon owner 'Hones' don, may possibly be derived from 'hounds' don, the hill where the kennel was kept."

"Hund" is the name for dog in old Scandinavian as well as Teutonic languages, so there is some little justification for associating it with the Danish word "don," for hill.

In view of the proximity of Ermin Street it is not surprising to hear, as we were told this afternoon, that there are good reasons to believe that a Roman villa once stood here. There was a Roman bath only covered in recently, and the well made by the Romans to supply the bath still furnishes water for the use of Hunsdon House. Fragments of Roman pottery and tiles have been turned up in the gardens.

The manor of Hunsdon seems to have been originally part of Stanstead. From Domesday we learn that Alwine de Godtone, who held eleven hides and half a virgate in Stanstead, laid one hide to Honesdon. This legal transfer had, I understand, the effect of constituting Hunsdon a

manor, of which Ralph Talboys was probably the first possessor after the Conquest.

It was afterwards held by Richard de Tonbridge, eldest son of the Earl of Hertford, who in 1124 removed the monks of Bec from his castle of Clare to the adjoining village of Stoke and bestowed on them yearly a doe from his park at Honesdon. This village is the existing one of Stoke-by-Clare, or Stoke-juxta-Clare, near to Clare in Suffolk.

Four years ago, when the East Herts Archæological Society inspected Hunsdon Church, their conductor, Mrs. Morris, stated:—"There are records to show that there was a church here in 1291, and there was also a rectory as well. The value of the rectory was 12 marks per annum, and the tithes were worth 24s., according to an inquisition of Pope Gregory IV." I have not been able to find the records of which Mrs. Morris spoke, and think she inferred the church from the mention of the rectory. But in the thirteenth century the term rectory would apply to a parish or living held by a rector, either lay or clerical, who took the tithes, rather than to a residence, and the value of the rectory would be derived from glebe lands or other endowments. Mrs. Morris further states that in the time of William II. or Henry I., sixty or seventy years before 1291, "Roger de Waveney gave this church with that of Stanstead Abbots to the Priory of Merton." This would lead one to surmise

* A paper read at a meeting of the Upper Norwood Athenæum on June 9 by Mr. Jonathan Downes.

BRASS OF JAMES GRAY, IN HUNSDON CHURCH.

that the two livings were held by one incumbent. Hunsdon-cum-Stanstead would be the designation of the conjoint parishes.

The three great historians of Herts—Chauncey, Clutterbuck and Cussans, whom I have consulted—are absolutely silent as to this point. To return to the manor. In the reign of Edward I. (1272-1307) the manor was in the possession of the Engayne family for nearly 200 years, until Robert Goldington, son of the last Engayne on the distaff side, sold it to Sir William Oldhalle. I have been unable to find the date of this sale, but Chauncey quotes from the Itinerary of William of Worcester with reference to Hunsdon House, "Willelmi Oldhal, Chivaler, first built this house about twenty-sixth year of Henry VI. (1447)."

Chauncey himself writes as if he were dubious of his facts. These are his words:—"Robert Goldington, I suppose, sold this manor to Sir William Oldhall, Kt., who served for this county in the Parliament 29th Hen. VI. (1451)." (He was Speaker of the House of Commons.) Chauncey continues:—"Was attainted of high treason in Parliament 38 Hen. VI. (1460) for adhering to the Duke of York. Shortly after" (it was the next year, 1461), "when Edward IV. obtained the Crown, Sir John Oldhall's son was restored, and built here a fair house in the mode of a castle in the reign of Edward IV. He was slain with Richard III. at Bosworth Field, 1485. But others say that Richard III. was possessor of this manor."

Mr. Cussans, the latest and I think the most correct of the historians, says of Sir Wm. Oldhall:—"This gentleman took a very prominent part in the Wars of the Roses on the side of the Yorkists, and after assisting to build the house and church, the estate was attainted after Bosworth."

Henry VII. granted the estate to his mother, Margaret, Countess of Richmond, and Thomas, Earl of Derby, her husband. Then in 1514 it was given by Henry VIII. to Thomas, Earl of Surrey, on his creation as Duke of Norfolk for his services at Flodden Field. The dukedom had been previously forfeited by his father. This duke, Thomas, died in 1524, and was succeeded by his son, the father of the poet Earl of Surrey.

In 1524 Henry VIII. resumed possession of the manor and enlarged the house and created it a palace royal, where he resided for some time, but used it chiefly as a nursery for his children, Mary, Elizabeth and Edward. Lady Elizabeth Fitzgerald, the "Fair Geraldine" of the poet Earl of Surrey, resided here with them. She was Elizabeth, second daughter of Gerald Fitzgerald, ninth Earl of Kildare, a child whose family was attainted for revolt against the Crown, and whose father was in the Tower when she was brought to Hunsdon to be cared for by her second cousin, the Princess Mary. This little homeless child was seven years old in the year of Surrey's marriage, eight years old when his first son was born. According to the custom of addressing sequences of love sonnets to anybody whom it was desired to honour and towards whom there was no personal love-suit (*vide* Dante's Beatrice and Petrarch's Laura), the Earl of Surrey, with kindly feelings towards the child, made her his Geraldine. When she was about fifteen (in 1543) she married Sir Anthony Brown, who built West Horsley Place.

The governess of the Princess Elizabeth was Lady Bryan, and one of the letters from Hunsdon and some of Prince Edward's letters from the same place are given in Strype's "Memorials."

Viscount Dillon, F.S.A., gives in the *Home Counties Magazine* of 1899 a list of New Year's gifts presented to Prince Edward at Hunsdon House on January 1, 1539. He was then under charge of Sibilla Penne, sister of Lady Sidney and wife of Henry VIII.'s barber-surgeon.

His Majesty heads the list with some silver-gilt ware, "A bason, ewer, potts and panes, and a standing cup with cover." Then follow:—

"The Lady Mary is Grace: A cote of crymosen satten embrowdered with gold, with pannses of pyrles, and sleeves of tynsell and iiij agletts of gold" (Mary, born in February 1516, was nearly twenty-three years of age).

"The Lady Elizabeth is Grace: A shyrtte of cam'ye of her own workynge" (Elizabeth was then nearly five years and a half, and Prince Edward was fifteen months old).

The list ends with the Abbot of Waltham, who gave "II oxen, XX mutton," and Mr. James Morrys, "II oxen."

On his accession to the throne Edward VI. granted Hunsdon to Princess Mary, and she resided here during his reign, and it was here that the news of his death was announced to her. On October 7, 1537, she was sponsor to the child of "one Welshe beside Hunsdon," baptized in Hunsdon Church.

When, in course of time, Queen Mary's reign was ended by her death, the estate devolved upon Queen Elizabeth. Sir Walter Scott, in his novel "Kenilworth," mentions Lord Hunsdon as one of the courtiers taking a prominent part in the revels at Kenilworth Castle, and this would be the nobleman in question.

Elizabeth granted it to her cousin-german Sir Henry, son of Sir William Carey and Mary Boleyn, sister of Elizabeth's mother. In January 1559 she created him Baron Hunsdon, and he was also captain of the Band of Pensioners, Privy Councillor, Knight of the Garter, Lord Chamberlain and General Warden of the Marches towards Scotland. He craved to be Earl of Wiltshire in right of Mary Boleyn, but Elizabeth would not accede to his request, and the disappointment so affected his health that he sickened and died. Before his death, however, the queen reversed her refusal, had the patent drawn up and his robes made, and the latter were spread on his bed when she visited him to confer the dignity of earl upon him. He declined the honour, saying that as she had not granted it to him when living he could not accept it when dying. He was buried in Westminster Abbey.

Hunsdon remained in the Carey family's possession for about 100 years, when Anne Carey married William, Lord Willoughby of Parham. He sold it on her death to Matthew Bluck, one of the six clerks in Chancery. His grandson Matthew mortgaged it in 1737 to Mr. Nicholson, who bequeathed it to his nephew, Nicholson Calvert, and it was for some years the seat of the Calvert family. Since that time it has passed through several hands, until at present it belongs to the Charrington family.

Hunsdon Church.

The church is dedicated to St. Dunstan. It is chiefly of the Early Perpendicular order of architecture, built of flint about the middle of the fifteenth century, and consists of a chancel with north aisle, nave with north porch, and south mortuary chapel of later date, western tower embattled and surmounted with slender spire containing eight bells.

It was once rich in stained glass placed in 1440-50 by Sir Wm. Oldhalle, then owner of Hunsdon House. Much has disappeared, but in the upper lights of the east window the Annunciation and the Adoration of Our Lord in Glory are depicted. In the south chancel windows may be seen the white rose of York and fetter locks, another Yorkist badge.

ST. DUNSTAN, HUNSDON

In the upper lights of a north window in the nave are some other fragments representing six of the Apostles.

The glass in the chancel window bears the date 1440-50, according to Mrs. Morris.

FETHER LOCK: A SHACKLE OR PADLOCK.

It was the badge of Edmund Plantagenet, of Langley, fifth son of Edward III., and of his great-grandson Edward IV.—From Boutell's "Heraldry."

In the chancel there is a recess in the north wall, said to be an Easter sepulchre, but this is doubtful. It bears three shields with coats of arms, and an inscription that "Francis Poyntz, knight, lies here—1528." In the south wall is a piscina and sedilia, bricked up during the restoration of 1851 under direction of Rev. Richard Thackeray (cousin of the novelist), but opened out in 1872.

There is a handsome altar tomb to Sir Thomas Foster, knight, justice of the King's Bench. He died in 1612.

On the south of nave is the mortuary chapel erected by Sir John Carey, afterwards third Baron Hunsdon. In a recess is a handsome altar tomb with recumbent figures of Sir John and Lady Carey. This was the second baron of Hunsdon, son of Sir Henry, first baron.

There are brasses to Wm. Gray, ob. 1517, and to Margaret, wife of John Shelley, citizen and mercer. Her figure is portrayed dressed in a shroud, formerly tied in a knot at the head and feet, but the two ends of the brass have disappeared. Her hair hangs down, and parts of her body and limbs are visible. Above her is an oriental Trinity, the First Person as an aged man with papal tiara, the Second as a Crucifix and the Third as a Dove. But the most notable brass is that affixed to the north wall of the nave to James Gray, keeper to Hunsdon House, who died 1591. It repre-

HUNSDON HOUSE.

sents a huntsman with crossbow, and an effigy of Death standing between him and a stag, smiting both at once. From the mouth of Death proceeds a label, with the words "Sic pergo," which may be translated, "Thus I go ahead," or "Thus I proceed about my business."

The epitaph reads thus:—

Beloved of all whilst he had lyfe
Vnmoend of none when he did die
James Gray, interred of his wife
Neer to this deaths-signe brasse doth lye
Yeares thirtie fyve, in good renownne
Parke and howse keeper in this towne
Obiit 12 Die Decembris Aº Dni 1591.
Ætatis sue 69.

There was an amusing discussion over this brass in the *Gentleman's Magazine* over a century ago. On October 10, 1794, "Philographice" sends a drawing of the brass and a copy of the epitaph, but his only remark is that the engraver was no anatomist. On February 8, 1795, "Temp Caneton" writes:—"It is meant to commemorate the extraordinary death of the gamekeeper, who expired suddenly whilst in the act of shooting at a buck with a crossbow. The same church contains many other very curious monuments."

"D. H.," writing on March 7, 1795, says:—"I see no reason for supposing that the brass plate at Hunsdon means anything more than that the man who in his time killed so many bucks was himself at last overtaken by death. To this the motto 'Sic pergo' evidently alludes—'thus I go on till the same fate befalls me.' All else must be the mere tradition of the persons who show the church."

"S. E.," on May 4, writes:—"I was inclined to the opinion of 'D. H.' respecting the brass plate at Hunsdon till I observed that Death holds a dart in each hand, which seems to denote that the stroke was inflicted on both objects at the same time. Neither 'Philographice' nor 'Temp Caneton' have given the motto. 'Sic pergo' may as well refer to death as the huntsman, 'Thus I go about my usual business.'"

Clutterbuck, in his description of the brass, says that "Death is withdrawing the arrow from the wounded hart with his left hand, whilst striking the huntsman with the arrow held in his right."

It is impossible now to ascertain which of these interpretations is correct, but it is reasonable, seeing that Death says, "Thus I proceed," that it alludes to the simultaneous death of the huntsman and the deer.

The font is original, but it was so energetically restored (?) in 1851 that it appears to be a new one. It is interesting because of the fact that on two occasions Queen Elizabeth officiated as sponsor. The following are copies from the register, which dates from 1546:—

"1576.

"Mrs. Elizth. Cary, daughter of Sir George Cary Knight, borne the 24th of March and baptized the 7th June, 1576 predict. Our soverayne lady the Queenes Ma^{tie}, the Countess of Warwick, godmother, Earl of Sussex, godfather."

"1584.

"Mr. Emanuel Scrowpe, sonne of Mr. Thomas Scrowpe, Esquier, was borne the first day of August and baptized the XVth daie of the same month, the Quenes Ma^{tie} beinge godmother, the Erle of Arundell and the Lorde Scrowpe beinge godfathers." As before mentioned, Queen Mary was sponsor here previous to the dissolution of monasteries.

The open pulpit and the screen before the Carey chapel are worthy of note, as good examples of Jacobean carving.

The first five of the bells bear inscriptions as follows:—

- No. 1. "Jesus be our spede 1630."
2. "God save the King 1630."
3. "The Rev. W. Calvert, Rector, J. Bryant of Hertford fecit 1787."
4. "Philip Eliot, Rector. Joseph Galton, John Hunsdon churchwardens 1668."
5. "Anthony Bartlett made mee 1652."

WILTON HOUSE.

FOR the annual meeting of the Wiltshire Archæological Society the district of Wilton was selected. The Earl of Pembroke is the president for the year, and the opening meeting was held in Wilton House, which Emerson described as the renowned seat of the Earls of Pembroke, a house known to Shakespeare and Massinger, the frequent home of Sir Philip Sidney when he wrote the "Arcadia," where he conversed with Lord Brooke, a man of deep thought and a poet, who caused to be inscribed on his tombstone, "Here lies Fulke Greville Lord Brooke, the friend of Sir Philip Sidney." As president of the meeting the Earl of Pembroke delivered an address in which he said:—

I think that I cannot do better than give you a short summary of some of the objects of interest in this house, which you will see when you go round, and at the same time recall to your recollection in more or less chronological order some events of historical interest that have occurred here from time to time in the lives of successive Earls of Pembroke. I pass over the earlier period relating to the battle between King Alfred and the Danes in 871, to the founding of the abbey, its history, with its associations with Cardinal Wolsey, all of which subjects have been so fully dealt with by Aubrey, Sir Richard Colt Hoare and

the late Mr. James Nightingale, and I pass on to the period of William, the first Earl of Pembroke, so created by Edward VI. in 1551. He it was who, as Sir William Herbert, was granted the abbey lands by Henry VIII., and he built the house from designs said to have been made by Hans Holbein. Of this house only the central tower on the east side, and the porch which formerly stood in the north-east corner of the quadrangle, but is now in the garden, remain. A portrait of this earl, attributed to Holbein, is in the library. He was a very leading and powerful nobleman in the days of Henry VIII., Edward VI., Mary and Elizabeth, and no doubt his power and importance during the first-named reign was increased by the fact of Henry VIII. marrying Catharine Parr, the sister of Anne Parr, Lady Herbert. On the occasion of the marriage of Queen Mary with Philip of Spain in 1554, Lord Pembroke received the Spanish envoy, and lodged him at Wilton for one night, on his way from Plymouth to Winchester. This earl died in 1570, and was succeeded by his son Henry, the second earl, who married Mary Sidney, sister to Sir Philip Sidney. That famous soldier, courtier and poet was a constant visitor to Wilton, and tradition tells us that he composed the famous "Arcadia" while wandering up and down the avenue in the park which still bears his name. In 1574 Queen Elizabeth paid a visit to Wilton, and it is possible that the "man Shakespear" was present upon that occasion. Philip Massinger, whose father was attached to Lord Pembroke's household, was brought up at Wilton. Unfortunately there is no portrait here of this earl, but that of his wife Mary Sidney, by Marc Geerarts, is in the library. He died in 1601, two years before the death of Queen Elizabeth, and was succeeded by his son William, the third earl. There is much controversy as to whether Shakespeare dedicated his sonnets under the initials "W. H." to this earl as William Herbert, or to Lord Southampton, but we have abundant evidence of his having been a great patron of the famous poet, and a portrait of him by Mytens, with an old MS. pasted on the back on which one of the sonnets is quoted, is now in the Single Cube Room. Another portrait of him by Vandyke is in the Double Cube Room. This earl entertained James I. at Wilton in 1603. He died without a son in 1630, and was succeeded by his brother Philip, the fourth earl, who had already been created Earl of Montgomery. This earl entertained Charles I. more than once at Wilton, and that monarch "did love Wilton above all places and came thither every summer" (Aubrey). This earl rebuilt a great portion of the house, notably the south front, which was designed by Inigo Jones, and he also laid out the old formal gardens from designs by Isaac de Caux. Of these gardens, however, nothing remain except a few statues and fountain, pillars, &c. This earl is the centre figure in Vandyke's famous family picture, which with other portraits by the same painter is in the Double Cube Room. He died in 1649 and was succeeded by his son Philip, the fifth earl, who is one of the figures in the big picture, and whose portrait, again by Vandyke, is in the ante-room to the Double Cube. A portrait of his wife, Penelope Naunton, by Vandyke, is also in the Double Cube. He died in 1669 and was succeeded by his son William, the sixth earl, whose portrait as a child, by Sir Peter Lely, is in the Single Cube Room. He died unmarried in 1674, and was succeeded by his half-brother Philip, the seventh earl, who married Henrietta de Querouaille, sister to the Duchess of Portsmouth. He had no son, fortunately, as he was not a very reputable nobleman, and his only daughter married John, Lord Jeffreys, whose portrait by Lely is in the library. There is no portrait known of this earl. He died in 1683, and was succeeded by his brother Thomas, the eighth earl, who was one of the most remarkable men of the time. He took an active part in the quelling of the Monmouth rebellion, was Ambassador Extraordinary to the States-General, Lord Privy Seal, First Plenipotentiary at the Treaty of Ryswick, Lord Lieutenant of Ireland, Lord High Admiral of England, and held many other appointments. He also brought over William of Orange. But in addition to this versatility in public life, he was a great "virtuoso" and student of art, and it was he who collected all the antique statues, busts, altars, sarcophagi, &c., which are ranged round the cloisters, having purchased in addition to his own collection the antiques collected by Lord Arundell, by Mazarin and Richelieu. A portrait of Earl Thomas by Wissing hangs in the Single Cube Room. He died in 1733, and was succeeded by his son Henry, ninth earl. This earl was a soldier, and was in 1751 constituted Lieutenant-

General of the King's forces. He was a great architect, and it was during his time that the Palladian bridge and the casino in the park were built. He also built Westminster Bridge. His portrait by Sir Godfrey Kneller is in the Single Cube, and his bust in the dining-room. He died in 1750, and was succeeded by his son Henry, tenth earl, who also was a soldier and a great lover of horses. He built the riding school at Wilton, and another at Whitehall, but the latter was subsequently pulled down. His portrait and that of his wife, by Sir Joshua Reynolds, are in the ante-room, others of himself and his horses, by Morier, in the billiard-room, and his collection of pictures of horses in all the attitudes of the *haute école* are in the lunging-room. This earl entertained George III. in 1778, when His Majesty held a review of the army on Camp Hill. He died in 1794, and was succeeded by his son George Augustus, the eleventh earl. It was during the lifetime of this earl that James Wyatt was employed in rebuilding the house. He built the cloisters and present entrance-hall, and also the library, but unfortunately was allowed, in order to carry out his plans, to pull down most of the north and west sides of the house. The whole of the gardens were rearranged and laid out about the same time under the personal supervision of Lady Pembroke, a daughter of Count Woronzow, the then Russian ambassador to London. It was about this time also that Inigo Jones's arch, with the lead statue of Marcus Aurelius on the top, was moved to its present position from the former site on the top of the hill in the park. I must apologise for having given you perhaps too much family history, but I found that the chronology of the objects of interest in the house and grounds was so much more easily marked out by taking the Earls of Pembroke in their succession than by any other plan, that I have risked the possible charge of talking too much about my own ancestors in order to give you information according to dates.

WEST MEON ROMAN VILLA.

BY permission of Mr. Meinertzhagen, the proprietor of Brockwood Park, the members of the Hampshire Field Club and Archaeological Society on July 25 visited the remains of the Roman villa which have been unearthed in Liffen's Wood, on the estate, during 1905 and 1906, under the direction of Mr. Moray Williams, F.S.A. Mr. William Dale, F.S.A., who organised and conducted the excursion, read a short paper, says the *Hampshire Advertiser*, about the Roman domestic buildings of Britain in general. About the civil life of the Roman occupation we know exceedingly little. What we do know is briefly this—setting aside the military camps and stations, there appear to have been certain small walled towns in which there was some sort of municipal or town life. Silchester and Venta Belgarum were examples. Mr. George E. Fox, F.S.A., goes so far as to say that Silchester must have been a self-governing place resembling our own municipalities. Outside the towns the country seems to have been divided up into estates or villas, at any rate in the vicinity of the roads, although there must have been great tracts of land unoccupied. The word "villa" is territorial, and means the estate or farm in which the great house was included. The houses, whether in towns like Silchester, or in the villas, were fairly uniform and were of two kinds. In some there was a long straight row of rooms with a corridor by the side, in others there were three such rows of rooms, set round an open court. Both of these types, the "corridor" and "courtyard" type, occur at Silchester. These houses do not resemble the Italian houses, and are regarded as local types, although they had Italian details such as hypocausts and mosaic flooring, and they varied in size and magnificence according to the means of the owner. The house at the villa of Bignor in Sussex, where are to be seen the finest mosaics still in situ, covered $5\frac{1}{2}$ acres of ground. The materials are nearly always native. The tesserae are made of brick or native rocks, and at Silchester they copied on the border of the pavement the bryonia plant they saw growing in the hedges. The warming arrangements were effective. In certain living-rooms the floors were hollow, and the heat from a stoke-hole circulated underneath them, and also up the sides of the room by means of flue tiles. Where the floor is supported upon tiles placed one on top of the other, or pilae, the hypocaust is said to be "composite." In others the solid floor is traversed by radiating channels, and the hypocaust is said to be "channelled." The quality of the mosaics is very varied. The pavements at Brading are ambitious in design, but somewhat rough

in execution, and inferior to the Bramdean villa, of which there are drawings in existence, although as a result of neglect which is truly deplorable, the pavements themselves have been allowed to perish. At Bignor the tesserae are not more than about $\frac{1}{4}$ -inch in size and the design is masterly and free. About the superstructure of these houses we can only guess. It is highly improbable there was a second storey. They had glazed windows and plastered walls, the plaster being decorated in colour, and they were roofed with tiles or slabs of stone, and sometimes thatched or reeded, nor do we know to what particular use any of the rooms were put. The people who lived in them spoke Latin—most of them were pagans, but some must have been Christians. The vessels they used were of pottery made in Britain under Roman influence, although with them is nearly always found the beautiful red ware imported from Gaul, and once called Samian, and sometimes pewter was used. Bronze fibulae and other personal articles give us hints of how they dressed, and careful examination of the rubbish pits has told us they baked bread and flavoured it with the seeds of the opium poppy, and had several kinds of fruit, including two kinds of plum and the medlar. Oysters and fish from the sea were also brought to them, while they appear to have eaten the flesh of most of the animals that serve for our food. All this and a great deal more may be found in the Silchester reports. Somewhere in that crepuscular period of the history of our country, the fifth century, these houses were forsaken. In some cases they show signs of fire—most of what was of any value was taken away. Bronze coins by the hundred were thrown away, although that was not the case here. The beautiful mosaics either perished or were mutilated, and frosts and roots of trees uprooted them, and often, as at Bignor, and most likely here too, the floor was wilfully broken through in order to obtain the tiles of the pilae. We must add to all these the sins of the unskilled explorer, or the neglect of those who have explored and then left the result to chance. The Bramdean pavements have so perished, and also the beautiful baths of opus signinum at the Twyford Villa, as well as the careful drawings of Miss Longmore made at that site. It is because we have in Mr. Williams a careful and intelligent explorer, that he wanted them to give him a slight tangible proof of their sympathy, and more particularly because he had another villa in view where he was not likely to have such liberal help as the owner of this property had given him. He would propose a grant of 5*l.* from the club funds towards the expenses of the excavations.

Mr. A. Moray Williams, B.A., returned thanks, and then conducted the visitors, who numbered about fifty, over the site. It had long been thought that Liffen's Wood, which is about a mile from West Meon, concealed a Roman building, and in 1904 Mr. Williams commenced the excavations, and by 1905, with the general help of Mr. D. Meinertzhagen, he had uncovered parts of a substantial house. Roughly, the villa covers an area of 160 feet by 50 feet, and contains a group of ten living rooms. Three are paved with mosaic and three with coarse red tesserae, the flooring of the four remaining having completely disappeared. One of the mosaic pavements is in a remarkably fine state of preservation. There is also a two-chambered hypocaust. Mr. Williams does not think the house extends much further than the area already touched, but further exploration is desirable. Finds have been comparatively few, and do not include coins or other datable or important objects. But a deposit of charcoal, black earth, slag and rude potsherds was found some hundred yards south-east of the house. The slag, examined by Dr. H. B. Baker, F.R.S., is iron slag, containing rather more iron than would be usual in modern slag. It may indicate a smithy, and the iron worked may have been obtained from the weald clay, which comes to within ten miles of West Meon. The visitors were much interested in all they saw and heard.

The Edinburgh Water Trust have under consideration a report by the city gardener approving the proposed afforestation of 5,000 acres at the Tallia works. The amount of planting to be undertaken annually should, he suggests, be about 200 acres—that is, four plots of 50 acres each. He does not think this could be done at less than 7*l.* per acre on the average. At that rate the annual outlay on planting would be 1,400*l.*, and allowing for contingencies such as beating up, &c., it might be taken at 1,500*l.* On this basis the cost of stocking the whole area would be 37,500*l.*, spread over twenty-five years.

MEDIAEVAL TILES OF WORCESTERSHIRE.

DURING the visit of the Royal Archæological Institute to Worcester a paper was read by the Rev. Canon Porter, of Claines, upon "The Mediæval Tiles of Worcestershire."

The Mediæval tiles of Worcestershire, he said, were so remarkable, and so exceeded in beauty those of any other county that it was surprising that they had not attracted more attention. His attention was drawn to them by the late Lord Alwyne Compton, a former Dean of Worcester, whose death was greatly regretted by that Society. The only paving in the cathedral of any importance was *in situ*, and that was valuable as showing the original arrangement. It was to be found in some rooms between the transept and the chapter-house, and over the room known as the parlour. It could not be earlier than 1377, as that was the date the rooms were built by William Poer, the cellarer. The tiles were very faint and much obliterated. They covered 70 square yards and contained some exquisite designs in foliage.

The tiles of Bredon, which were arranged in the risers of the steps of the sacarium, formed the finest heraldic series that England could show. After careful examination of the drawings of the eminent architect, Mr. Rowland Paul, he had fixed the date of the series at 1372-5. Many of those present would be familiar with the very curious badge and interlaced sickles which were seen in Mr. St. John Hope's drawings of the garter plates at Windsor. Those tiles were made at Droitwich, and before 1887 he often found them in various parts of the neighbourhood, at Porter's Mill (Claines), St. Peter's (Droitwich), Cotheridge, and, best of all, at Little Comberton. Comparatively few of these pavements remained in their original position, partly owing to ignorant restoration and partly to the practice of breaking the floor to form vaults—a most pernicious custom. When they restored Claines Church they found the remains of bodies within 2 inches of the feet of the worshippers. That would partly account for their not having in the county a single perfect example of the fine sepulchral cross which used to be, in living memory, in the north aisle of the lady chapel of the cathedral.

In the fifteenth and in the earlier years of the sixteenth centuries tiles were, so far as they knew, only produced at Droitwich and Malvern kilns, but there must have been a kiln at or near Hailes Abbey, as there were marked differences between that pavement and their own. The Canon then described the process of manufacture. A square of red clay from 4 inches to 6 inches across having been partially hardened in the sun, a design was impressed by a stamp cut in relief, and the whole coloured with a whitish coloured clay. That being allowed to dry, the superfluous hard clay was scraped off, and the "quarrel" (as it was called) thus formed was put into the kiln. There was a grave difficulty as to glaze, and the speaker had once or twice been deceived at first sight by a modern tile as Mediæval. The exact tone of the old yellow glaze it seemed impossible to obtain, but at Malvern the tiles had it splendidly.

Canon Porter suggested that all old tiles when refixed should be placed on the wall, as they would then not be worn. This had been done with marked success at Claines, Fladbury and Hindlip. He was convinced that far the largest portion of Worcestershire tiles of the fifteenth century were made at Droitwich and Malvern, where kilns and fragments of tiles had been discovered. The Droitwich kiln was discovered in 1837 in the parish of St. Mary, Witton, and the kiln at Malvern was found by a distinguished architect in 1833, within 200 yards of the priory church. The proceeds of these two kilns have been found in various parts of England. The glorious tiles of Malvern were very well known. They were the finest in the world, and as they had always been on walls they were in a fine state of preservation. Not many were earlier than 1460, when the church was rededicated by Bishop Carpenter. After commenting upon the interesting designs to be found upon tiles in Worcestershire—he showed an illustration of one depicting all the accessories of the Cross—Canon Porter concluded by describing in an interesting manner four sets of Malvern tiles.

The Vice-President observed that they had listened to quite an ideal paper. It was extraordinary that upon a subject which many of them had expected to be extremely technical they should have had an audience like that kept in close attention the whole time, everyone feeling that the address was being poured out of a remarkable fountain of special knowledge on the subject. He had never heard an

archæological paper which seemed to him so completely scientific, so full of suggestiveness of every kind.

A discussion ensued, says the *Worcester Chronicle*, which the President subsequently characterised as the most interesting they had had at any of their meetings. He also remarked that it appeared a great piece of good fortune that they were in view of a revival of the study of ecclesiastical tiles. One thing which had struck him in the paper was that the tiles produced in Worcestershire should be all of one particular class, of the type in which the patterns had been cut into the red clay and the pattern itself filled up with white or yellow slips forming the white pattern on the red background. As a rule there was no incising, simply a sort of painting by pouring yellow slip over the body of red clay. There was a really fine collection of tiles in the British Museum, and the only way to study the matter scientifically and properly was to enlarge that collection. He appealed to Canon Porter to persuade his friends in Worcestershire to let them have specimens of the various local manufactures—they already had one of the grandest specimens of the Malvern series. He proposed a hearty vote of thanks to Canon Porter for his paper.

This having been carried unanimously, Canon Porter, in reply, mentioned that he had been a member of the Institute for thirty-one years, and it was a great pleasure to him to again read a paper before them. With regard to specimens going to the British Museum, he could only say that the clergy were but the temporary guardians of what was in their churches, and he for one would never be a party to encouraging the removal of any of the old tiles from their proper places, not even to go to the British Museum.

The President mentioned that excavations were often made, and no care taken of the tiles, &c., and in such cases they might be sent to the British Museum, where they would be carefully preserved.

GENERAL.

The Exhibition of Belgian art at the Guildhall Art Gallery closed on Saturday. In all 150,000 visitors have passed through the turnstiles, the daily average being about 1,500.

The London County Council have made arrangements for the "Council Chamber" at No. 17 Fleet Street to be open to the public, who will be admitted free every week-day, except Good Friday and Christmas Day, between the hours of 10 A.M. and 2 P.M. The room will be available after those hours for meetings of societies, &c., on terms to be arranged.

The Edinburgh Town Council have adopted the recommendation to make a Register of Historical Buildings in Edinburgh at a probable cost of 20*l*. It has been found that a register of such houses exists, having been prepared by Mr. Bruce Holmes and Mr. Thomas Ross, architect. That had been placed at the disposal of the Council. The money asked was to bring the register up to date and make a map on which these houses would be marked.

A Site at the east end of the Serpentine has been selected for the bronze statue, representing Physical Energy, by the late Mr. G. F. Watts, R.A.

Her Royal Highness Princess Louise, Duchess of Argyll, has consented to design a massive challenge trophy, "The Argyll Shield," to be competed for annually at a pipe band contest held at Dunoon in connection with the Cowal Highland gathering on August 25. The design of the shield will be purely Celtic in character.

Sir T. D. Gibson Carmichael has been appointed a trustee of the National Gallery, in succession to the late Sir Charles Tennant.

The National Trust stated last week that 900*l*. is still required to complete the fund for the preservation of Barrington Court, and donations should be sent to Mr. Nigel Bond, secretary, 25 Victoria Street, Westminster.

Mr. Harcourt, M.P., First Commissioner of Works, hopes to have a scheme for the improvement of the ventilation of the Royal Scottish Museum, Edinburgh, ready for consideration on next year's estimates.

Messrs. Russell & Cooper, 11 Gray's Inn Square, have been placed first in the limited competition for a central library in St. Pancras by Mr. J. Belcher, A.R.A., the assessor. The cost of the building and site is estimated at about 33,000*l*. The other five competitors are each to receive an honorarium of forty guineas.

The Midsummer Examinations of the Institute of Architects increased the roll by 129 probationers, and seventy-six registered students; sixty-one candidates also passed the final and special examination.

Mr. Walter Gay, the American painter, who resides in Paris, has been promoted to the rank of officer in the Legion of Honour.

The Late Mr. Alfred Beit in his recently published will gives the picture painted by Sir Joshua Reynolds and called "Lady Cockburn and her Children," which was for some years in the National Gallery, to the National Gallery. He gives the picture by Sir Joshua Reynolds called "Mrs. Boone and her Daughter" (afterwards Lady Drummond) to the Kaiserliche Museum in Berlin, and a bronze statuette, "Hercules," by Polajuolo. He gives the majolica plate, which is out of the service of Isabella Gonzaga d'Este, and was bought at the Spitzer sale in Paris, to the Museum für Kunst und Gewerbe, Hamburg.

Sir John Ure Primrose presided at the inaugural meeting of Provand's Lordship Literary Club, founded to preserve intact, if possible, the oldest house in Glasgow, situated at 1, 3 and 5 Castle Street (Cathedral Square), corner of M'Leod Street. It is a fifteenth-century house visited by Mary Queen of Scots, and the last remnant of Old Glasgow. The Marquis of Graham has consented to be honorary president; Sir John Ure Primrose, Bart., president; Mr. Arthur Kay, vice-president.

At Melley Abbey in July, 1907, there will be a historical pageant dealing with the period at the abbey from 1239 to 1538-9. The profit will go to the Winchester Cathedral Restoration Fund. It will represent scenes chiefly from the plays of Shakespeare, to illustrate English history during the period of 300 years of the abbey's existence as a Cistercian monastery.

The General Purposes Committee of the Marylebone Borough Council recommend that a new town hall be erected, so that the whole of the work can be carried on under one roof.

The University of Leeds are to confer the honorary degree of Litt.D. upon Sir Charles Holroyd, a native of Leeds, who is now director of the National Gallery.

The San Francisco Board of Public Works have condemned the City Hall, which cost 1,400,000*l*., as unsafe.

The National Collections have been enriched by Raphael's "Madonna of the Tower," Herman Saftleven's "Christ Preaching on the Sea of Galilee," Madox Brown's "Chaucer at the Court of Edward III.," and five works of Turner—"The Old Chain Pier, Brighton," "A Ship Aground," "The Arch of Constantine, Rome," "Tivoli" and "The Burning of the Ships."

The Belfast City Hall, of which Mr. A. Brumwell Thomas, of Westminster, is architect, was formally opened by the Lord-Lieutenant of Ireland on Wednesday.

Professor Ray Lankester, the president of the British Association for this year, has been asked to retire from the directorship of the Natural History Museum, South Kensington.

Mr. Harcourt, M.P., First Commissioner of Works, in answer to a question in Parliament, has stated that, in accordance with a scheme sanctioned by his predecessor, it is proposed to build the Stationery Office upon the vacant land behind the National Gallery of Art at Millbank. The extensions originally contemplated when the site was offered by the Government to Sir Henry Tate in 1893 have already been made. He promised to make inquiry as to the future needs of the Gallery, and to reconsider the matter before next year's estimates are framed. He mentioned that some space is still reserved for the purpose of the Gallery.

A Question was asked in the House of Commons respecting the reduction of space above the ground floor in Regent Street after rebuilding. Mr. McKenna, in reply, stated that no complete design has been settled for the rebuilding of Regent Street other than the Quadrant, but as the houses in the whole street will be rebuilt in the near future by degrees, either singly or a few at a time, a general building line for the whole street has been agreed between the Commissioner of Woods and the London County Council. A reduction of 3,400 feet in the area at present occupied is contemplated, but as the upper storeys of many of the houses will be built further out than at present there will be no loss in cubic contents, and it is not expected that the land revenue will be adversely affected. On the other hand, the street will be widened.

The Architect.

THE WEEK.

ALTHOUGH ARNOLD BÖCKLIN was born at Bale and should therefore be considered as one of the Swiss artists, Germany has claimed him as one of its representative painters. His early studies were no doubt in Düsseldorf, but he worked also in Antwerp, Brussels, Paris and Rome. Many Germans, however, believe that no modern artist possessed more of the national characteristics. Like GOETHE, he tried to realise antique subjects in a German manner. His scriptural subjects were also peculiar. He could in addition be a realist, and yet no one was better able to represent subjects from "A Midsummer Night's Dream." During the last eight or nine years of his life he lived at San Domenico, near Florence. Lovers of his works are now troubled because the owner of the villa in which he lived and died has decided to blot out or change everything which is suggestive of the artist's occupation. He is within his rights in doing so, for ordinary tenants might not care to have before them reminders of their own inferiority. It is therefore proposed to make arrangements by which a part of the villa at least will always recall the painter who could claim to be the most modern of German artists. That end cannot be attained without the expenditure of a fairly large sum of money. It remains to be seen whether the five years which have elapsed since BÖCKLIN's death have diminished the enthusiasm for the painter of the *Battle of the Centaurs*, the *Nymph and Satyr*, the *Hermit in the Desert*, and other works which were produced by a truly original man of genius.

THE action *FEAR v. PHILLIPS*, which has been tried before Mr. Justice JELF at Lampeter, Brecon, London and Swansea, differs from ordinary light and air cases owing to the view of the circumstances which was taken by his Lordship and which gave character to the decision. Plaintiff and defendant were both tenants of the Corporation of Aberystwith. The defendant obtained a new lease in last October, under which he erected an arcade, a coliseum, shops, &c. He raised the back wall of his premises from 17½ feet to 41 feet 8 inches, and from 21 feet 1 inch to 48 feet 9 inches. As the plaintiff's back yard was only 11 feet 8 inches wide there could be little doubt of a diminution of light and air. It was contended that the obstruction was not sufficient to become a nuisance—an argument which his Lordship overruled—and it was also contended that there was acquiescence on the part of the plaintiff, which was likewise set aside by the Judge. The important point, according to his Lordship, was the deprivation of air. His Lordship pointed out that the right to light could only be acquired under the Prescription Act, while the right to air could not be so acquired. By improperly raising the two walls defendant had been guilty of interference with air, which was actionable. Whether there was less air was doubtful, but there was interference with its salubrious character. His Lordship said there were few authorities on the subject, and in order that his decision might be reviewed he had resolved to assess the damages as to air and as to light separately, viz. 200*l.* for light, 200*l.* for air and 25*l.* for illness in plaintiff's family, which it was alleged arose from the interference. A stay of execution was granted.

THE report on "The Effects of Tremors on Astronomical Observations, with especial reference to the Greenwich Observatory," which Professor H. H. TURNER presented to the British Association, has special interest at the present time. He considered if an instrument be turned from one position into another very different, it would not take up its new position all

at once, but for a few minutes after it had been set there would be slow, minute changes going on, arising from the yielding to stresses and the giving way of friction. This was no mere theoretical supposition, for such changes had been proved to occur in the case of the Greenwich transit circle by a long series of flexure observations made in 1894. Any change in the tremors in the neighbourhood of an observatory would probably introduce some systematic changes in the observations of zenith distance. The changes were of a kind which might be very difficult to explain, for they might occur in spite of the fact that all the other circumstances had been preserved precisely the same. It was to be remarked also that the previous existence of tremors from railways was no safeguard against a totally new interference from those at present threatened. The former would naturally be intermittent; a train passed now and again, and the observation of a particular star might suffer a little, but if the engines of the generating station produced continuous tremors all the observations would be affected. Professor TURNER was able to refer to a paper by Dr. ROBINSON, the astronomer, on a case of disturbance which occurred at the Observatory of Armagh, owing to the proximity of the Ulster Railway. It was found that the observations were disturbed in several ways by the shaking of the mercury trough with which observations were made by reflection, and the consequent difficulty in determining the nadir point. Dr. ROBINSON found that if after the bisection of a star, but before the microscopes were read, a train was heard to pass, the shaking caused a displacement of the instrument, and the record might consequently be erroneous by as much as four seconds. The County Council, we suppose, will not wait for the results of complex experiments, but will take it for granted that there is a possibility of danger, and although it may be remote will do all that practical engineers can suggest to prevent tremors occurring.

A LANDLORD through his agent lets premises to a tenant, nothing being said as to repairs. The floor of the kitchen is in a bad state of repair, and the landlord's agent agrees to do the repairs. The repairs are not done, and consequently the tenant's wife is injured. The tenant recovers damages for breach of the contract to repair. Can his wife also recover damages for the injuries she has sustained? The House of Lords in the case of *CAVALIER v. POPE* have decided that she cannot. The contract to repair was not made with the wife, and therefore she cannot sue upon it. Apart from contract, the law placed no duty upon the landlord to effect the repairs. As he owed no duty to anyone except the tenant with whom he had made the contract the wife had no cause of action. As Lord JAMES OF HEREFORD said, "Moral responsibility, however clearly established, is not identical with legal liability." Tenants, if they succeed in inducing landlords to make repairs, should see that the repairs are done promptly, lest the consequences of non-repair injure their families.

It is a disappointment to the Greek Government as well as to all students of Classic archaeology that the recent diving operations off the coast of Kerigo or Antikythera have not been successful. The fine figure of a youth, known as the Ephebos of Antikythera, which was one of the earliest discoveries and is now one of the most interesting objects in the National Museum at Athens, suggested that many valuables were lying at the bottom of the shallow sea. But a rival to that work has not been recovered. The diving may now be considered as ended. Fragments of the sailing vessel which contained the sculpture and of statues and vases are not considered to be equivalents for the labour and expense which were necessary. Apparently the sunken vessel foundered while on a voyage to Byzantium with some of the spoils of Greece.

THE BRITISH MUSEUM.

THE President of the British Association, in his inaugural address, drew attention to the fact that science is not advancing in public consideration and support. Professor RAY LANKESTER thought the cause was the defective education given in schools and universities. His remedy was improved education for the upper classes. He implored the members of the Association to carry out the spirit of the Institution, which was the advancement of science, by insisting that their sons and daughters should receive reasonable instruction in science in schools and colleges. Schoolmasters, he said, believe that what parents require is trifling with classical literature and success in athletics. Men who are anxious for the promotion of art in the country are also lamenting the general indifference. Architects are supposed to believe that the educational system must be revolutionised in order that the world in general may be able to appreciate their art. Some support is undoubtedly given to all these jeremiads by the return of the chief librarian of the British Museum. The number of visitors during the year 1905 was 813,659, while in 1904 the total was 954,551. In the reading-room there was a diminution from 226,323 to 214,940. In other departments there was a reduction; the Natural History Museum alone showing a notable increase of visitors. It may therefore be concluded that if the public do not study science or art, compensation is not to be found in the attention given to treasures in the Bloomsbury Museum.

The official return is especially interesting from the accounts which are given of the excavations undertaken by the Trustees at Nineveh and Ephesus. In 1820 RICH, who was the political agent at Bagdad, examined the mounds near that town and received information concerning slabs with figures in relief which had been taken out of the ruins. He came to the conclusion that the great mounds of earth covered the remains of ancient buildings. No importance was attached to his opinion—at least, in this country. About twenty years afterwards M. BOTTA, the French consul at Mosul, tried the experiment on a great mound known as Kouyunjik. He was not successful, and on the suggestion of a peasant he transferred his operations to Khorsabad. It was not long before he was amply rewarded by the architectural and sculptural remains which were unearthed and the illustrations of which astonished Europe. BOTTA was a friend of AUSTEN HENRY LAYARD, who had long been eager to explore the remains, and in 1845 he was enabled to begin digging at the great mound at Nimroud. His first important discovery was a colossal bearded head, the sight of which frightened the Arabs and caused the operations to be suspended.

At Kouyunjik it was necessary to descend to a depth that was considered immense by the Arabs, for in some cases trenches had to be formed to a depth of 30 feet. The remains of a magnificent palace were found, every apartment having sculptured panels representative of a different subject. It was calculated that the bas-reliefs, if put together, would measure about two miles. There were twenty-seven portals flanked by winged bulls and sphinxes. After LAYARD's departure the Trustees took up the work, and it has been from time to time resumed. According to the Blue Book, the latest excavations at Kouyunjik were commenced in 1903 and continued until 1905. The mound may now be considered as exhausted, for trenches were cut in all directions in order to ascertain whether any remains had been overlooked. The latest discovery is the site of the Temple of NABU, the god of war of Nineveh. The report says:—

The ruins were cleared, but the building had been so utterly destroyed and burnt, presumably by the Elamites at the capture of the city, that it was not possible even to make a complete plan of it. The library of tablets, which it probably contained, must have been entirely destroyed.

So thorough indeed was the destruction of the city by the conquerors, to judge from the condition of the remains, that the preservation of the collection of tablets now in the Museum, and forming only a part of the great library of Sennacherib and Ashur-bani-pal, must be attributed to some accidental falling in of debris, which thus covered them and saved them from the enemy.

LAYARD had pointed out that while at Nimroud most of the buildings showed no sign of fire, it was evident at Kouyunjik there must have been a terrible conflagration. Whether it was the same fire that destroyed the palace of SENNACHERIB and the Temple of NABU is a question which may be left to the discussion of historians. It is to be regretted that all parts of the temple of the war god were so completely destroyed that a plan cannot be made. What FERGUSON said still remains true, viz.:—"There are no religious edifices sufficiently complete to enable us to form a distinct idea of what the architectural arrangements of these temples were. As belonging to a Semitic people we should expect them to be few and insignificant." A bas-relief found by BOTTA at Khorsabad represented a small building with two columns, having capitals of a rude Ionic type, has been supposed to show either a temple or a fishing kiosk. LAYARD drew the conclusion:—"The edifices hitherto explored at Nineveh appear to have been palace-temples—that is to say, they served both for the residence of the king, who was the high priest as well as the political ruler of the nation, and for the celebration of great religious ceremonies in which he was the principal officiator. Such was also the case in Egypt, where the palace also comprised the temple."

The great structures of Nineveh, although they caused intense excitement some sixty years ago, cannot be said to have had any influence upon modern architecture. The discoveries by Mr. WOOD of the remains of the Temple of DIANA at Ephesus are of more general interest. The peculiar Ionic capitals and the sculptured drums might be considered as revelations. As has happened elsewhere in classic lands, and the practice has been continued during the Christian era, there were at least four temples erected on the site. Archæology has advanced during the thirty years which have passed since Mr. WOOD's discoveries, and curiosity is excited about remains which at that time were not valued. The report imparts the following information concerning the recent excavations:—

The excavations on the site of the Temple of Artemis at Ephesus were brought to a close on June 17. The result of the two seasons' excavations is as follows:—The remains of four temples superimposed one on another have been examined. Taking these temples in order, from the latest to the earliest, they are:—(1) The temple of the middle of the fourth century B.C., which was the main object of Mr. J. T. WOOD's exploration. Mr. WOOD removed almost every relic of it, and his work proves to have been very thorough. The remains which he discovered are those now in the British Museum. (2) The temple built in the middle of the sixth century B.C., usually associated with the name of CRÆSUS, was the original object of the recent exploration. This temple was only touched by WOOD. The whole area of the surviving platform has now been cleared, and, from the numerous fragments recovered, an architectural restoration of all except the architraves will be possible. (3) The third temple, the existence of which has been hitherto unsuspected, was very little below the level of the one above, and was of smaller area. Only small traces of it remain, and its period of existence was probably short. (4) Of the lowest and earliest temple, the structure of what may have been the naos or statue-base alone remains. The lowest blocks of this structure are laid on the virgin sand. It was here that numerous objects of gold, ivory, &c., were found. From the style of these objects it is inferred that the period of this earliest temple was probably not earlier than the seventh century B.C. The work was much impeded by abnormally heavy rains.

Several important additions have been made to the collections. The late C. A. BUCKLER, architect, bequeathed a valuable series of architectural drawings of

English cathedrals and other churches. Already the Museum possessed many others by members of his family. Donations of drawings of the old masters and engravings are also recorded. The most conspicuous addition to the Department of Egyptian and Assyrian Antiquities is the sculptured wall from the chapel of the pyramid, in the island of Meroë, of a Queen CANDACE of the first or second century, presented by the Government of the Sudan. The following description is given :—

This pyramid was built for one of the great queens of Meroë, who bore the title of "Candace," probably during the first or second century of the Christian era, and its chapel and forecourts and propylons were sculptured with elaborate reliefs, representing the queen's funeral procession, the offerings made in the tomb, &c. The queen's name is nowhere found on the walls in hieroglyphics, and the cartouches, which are sculptured in high relief and in a very prominent place, have not been filled up. At one end of the wall the queen is seen seated by her consort, whose name also is unknown. She wears a fringed garment with ropes and tassels, and on her arms are elaborately ornamented armlets. The reliefs on the other portion of the wall represent a table of offerings, the Hall of Osiris, the Judgment Scene, rows of divine and other figures making offerings and pouring out libations before the queen, who is also seen leading four bulls for sacrifice. The reliefs on the wall are typical of the best class of funereal sculpture in the island of Meroë, of which, before the arrival of this object, there was no example in the National Collection.

Among the purchases are a series of rare Egyptian scarabs, dating from about 3,500 to 650 B.C.; a collection of upwards of 600 Babylonian inscribed tablets of about 2,400 B.C.; and a valuable series of Babylonian cylinder seals.

By gift from the Marquess of SLIGO, the Department of Greek and Roman Antiquities has received the greater part of the two flanking columns of the doorway of the Treasury of ATREUS at Mycenæ. These have been supplemented by casts of other fragments, presented chiefly by the Greek Government; and a restoration of the structure has been built up in the room of Archaic Greek sculpture. The remains were described in a paper by Mr. CECIL SMITH, which was read before the Congress of Architects, and of which a report appeared in this Journal.

The expedition to Lhasa has enriched the Museum with a number of brass, copper, wood and stone figures of deities, many containing manuscripts and charms, temple-vessels, pictures, furniture and book-covers, idol ornaments and charms from Lhasa and monasteries in Tibet; also nine temple-pictures with representations of various deities in colours, and a series of clay images and dagobas, used as votive offerings.

The Government of India have also presented very important manuscripts, books and objects of antiquity and curiosity chosen from the collections formed during the expedition.

A CORNISH STONE CIRCLE.

AMONG the categories which are ascribed to ARISTOTLE as a summary of the varieties of subjects of propositions "time" is included. To him as to others it appeared to be inevitable that an object must exist in a particular time as well as in a particular place. Many other men at later periods who devised a different sort of summary respected "time" and "place." Modern logicians endeavour to dispense with both or to give them less importance. Even from the rough system of the phrenologists "time" cannot be excluded.

To make "time" a category was the more remarkable, because the Greek historians, who might be supposed to find the necessity of it in narrating events, were almost indifferent to dates. HERODOTUS never seemed to question any statement made to him about the duration of a kingdom or a temple. It was his business to describe the prodigies he saw or heard about in his travels, and his gullibility was measureless. Once in five hundred years he believed the phoenix arrived in Egypt, bringing with him the embalmed body of his

venerable parent, which he deposited in the Temple of the Sun. In the temple dedicated to PERSEUS was a chapel with an image of the hero, and he frequently appeared as if to gaze on the likeness of himself. As evidence the priests showed one of his sandals, which was two cubits in length. Whenever it was necessary to employ antiquity as an adjunct of greatness the priests or scholars did not scruple to retail their legends to the traveller, and HERODOTUS in his simple way considered it was his duty to relate all he heard. He was, however, exact if compared with some of the Indian annalists, who believed that virtuous men could live on earth for 100,000 years, and that one of their monarchs reigned for 6,000,000 years.

From this early looseness in treating chronology men were compelled to realise that unless some means were taken to insure accuracy their annals in course of time would also resemble fables. Hence they took care to inscribe dates upon public buildings, and adopted the other precautions against forgetfulness which were then possible. Unfortunately the means were not always enduring, and chronology is in consequence a subject which is marvellously diversified. We have only to compare the periods of the Chinese with those still accepted in a great part of Europe in order to perceive how uncertain must be the conclusions relating to the progress of time.

Geological investigations have given an impetus to a study of the subject. Once it is assumed that the earth existed from a time which is beyond the span of even Chinese chronology, the next question becomes, "What is the earliest proof we can bring forward of the existence of man on the globe?" The solution is aided by the circumstance that man left records of his existence which, although they do not take the form of written annals, are perhaps more acceptable. As in this country we possess means for a very wide study of geology, so we have also numerous objects on a great scale to aid us in the study of prehistoric archæology. Among them the first place must be given to the stone circles which for many years have been puzzles to most observers. We need not here attempt to enumerate the uses which they were supposed to fulfil. In a country which is endowed with churches having "long-drawn aisles" it is natural to suppose that the stones served in aiding religious processions, or in the observation of the sun and stars, which it is not unreasonable to infer were assumed to be images or symbols of Divine powers. BERNARD LAZARE, who is a great authority in the Quartier Latin if not at the Institut, in his legend of "L'Offrande à la Déesse," has suggested the grand effect which could be produced with a stone circle for a temple.

The British Association possesses a committee whose purpose it is to undertake excavations in order to discover, if possible, the age of the stone circles in this country. The report which was presented this year to the York meeting relates to the Stripples Stones. They are the survivors of those which formed a large stone circle in an out-of-the-way district of East Cornwall between Bodmin and Camelford. There are four stones still standing, and all are in positions which indicate that originally they formed part of a true circle. There is another stone which is a foot or two out of the true line of the circumference, owing probably to a difficulty in laying out a circle having a diameter of 146½ feet. About three miles distant is the Fernacre circle, which has also a diameter of 146½ feet. Whether the correspondence was the result of accident or action cannot be known. Mr. H. St. GEORGE GRAY, who had charge of the excavations and who made the survey, says:—"It may safely be stated that the circle originally consisted of twenty-eight standing stones, placed at an average distance of 16½ feet apart. Of stones in their relative positions in the true circle there are at the present time four standing, one almost recumbent, eight recumbent and one which may not have been a stone of the circle, but merely a modern

introduction when the wall was built. In Mr. LUKIS's plan (1879) we get five standing stones and ten prostrate stones falling in the line of the circle, which shows that during the last three decades the Stripples Stones have altered much from pillage."

The reason for selecting the Stripples Stones circle for examination was that it was one of the four known circles which were surrounded by a vallum and a fosse, the latter being within the former. It was also found that bays or recesses were formed on the outer margin of the fosse which give it a peculiar character. Another remarkable feature shows the ingenuity of the men who raised the circle. In excavating round one of the prostrate stones it was found that fairly large blocks of granite were used as wedges in order to give security to the stone, which had a base that was somewhat pointed. This effort was met with in only one instance, but it is sufficient to show that the primitive men were able to reason.

It was evident also that in excavating the fosse the men were not as skilful as modern navvies and were careless as to giving a uniform slope to the sides. They knew the advantage of having a rounded bottom, and they were able to extend the width of the cutting in some places from $9\frac{1}{2}$ feet to 16 feet. About a dozen pieces of oak were found in one of the cuttings. On some there are traces of rough cutting, but it is impossible to say whether the cuts and hacks were made before the wood was placed in the ditch.

When speaking of ditches or other aids to defence it is customary to suppose that with prehistoric man no other purpose was in view. Mr. GRAY maintains that one part, at least, of the fosse was intended to serve for the drainage of the central plateau. As there is bog-iron ore near the surface there is a tendency after much rain for the ground to become swampy. And a drain would therefore be an aid to keep the circle in a fitting condition. Naturally the ground is not perfectly level. But if a corresponding drain existed on the south side of the circle it must have been very narrow.

The object of the excavations was, as we have said, to discover if possible some evidence of the age of this circle. As yet the subject has not been sufficiently studied to enable observers to discern differences of treatment in the stones. Nor does it seem possible that the monoliths will ever yield the desired information. Value is accordingly attached to the most insignificant relics which may be found in excavations. Mr. GRAY has the courage to declare that the few flint-flakes which were turned up in the twenty-five various cuttings are no certain evidence of date. The flint-flakes may have belonged to a later time and may have been produced in some other district. Not one object in bronze was met with, and, in fact, the only point cleared up is that the circle was not a burial-place, since there was no trace of human remains in the excavations. The absence of all archæological evidence—and a very humble class would give satisfaction—imparts, however, a peculiar interest to the Stripples Stones. Whether they were raised in the Neolithic or Early Bronze Age, the removal and fixing must have been the work of men whose only claim to have been worthy of entering within the zone of elementary civilisation was the instinct which enabled them to collect large stones—they vary from 6 feet to 12 feet in height—with an intention which is not to be discovered, but which was not at least for shelter.

COAST EROSION.*

THE erosion of our coast must be studied in conjunction with the deposition of the material eroded. When examined in this way we find in England that it has not been a continuous process, varying when short periods are studied, but averaging the same from century to century. Instead of this regular process, the rapid accumulation in certain places teaches us that coast erosion, as we now see

it, began at a definite date, before which conditions were entirely different. If this were not so, the area of the new lands, accumulations of shingle and of sand-dunes would be much greater. It does not seem practicable to obtain exact measures, but the rates of accumulation of various recent deposits and of the silting-up of our harbours suggest that the cliff erosion only began 3,000 or 4,000 years ago, or at about the date when our harbours were already in use and Stonehenge was being raised.

In order to understand the nature of the changes that are now going on it is necessary to look back to the Neolithic period to see what the country was then like, otherwise the existing irregularities of our coast-line will be quite unintelligible. It is not needful to go back further, but we must picture the country as it looked when the sea stood 60 feet lower.

A close study of the buried land surfaces, or "submerged forests," found in the alluvium of all our estuaries at various levels down to about 50 feet below the present sea-level shows that oak trees flourished on the lowest of these ancient soils. This shows that the sea then stood so far below its present level that the highest tides could not reach the roots of these trees. These old land surfaces seem all to be of Neolithic date. During this period the seaward end of all our valleys was deepened till the channel reached about 60 feet below its present level. The south and east coasts of England were utterly unlike what we now see. Instead of bold cliffs there was a wide coastal plain, like that which still extends for many miles west of Brighton, separating the rising Downs from the coast. This plain extended out approximately to the existing 10-fathom line.

About 4,000 years ago there set in a fairly rapid but intermittent subsidence of the land or rise of the sea. This subsidence flooded great part of the coastal plain, brought the waves within striking distance of the rising land behind, and submerged the lower part of all our valleys.

The process seems to have been more rapid and jerky than any change which has been recorded of late years, for the deposits in all our big estuaries tell the same tale. We find rapidly deposited marine silt alternating with thin beds of peat or soils with trees. But the vegetation is usually nothing but brushwood or quick-growing trees, and the peat also is of rapid growth. Only at the very bottom of these deposits, far below the present sea-level, are oaks of more than 100 years to be seen.

The rise of the sea-level may have been completed about 3,500 years ago. Whatever may be its exact date, the completion of the rise is the starting-point of our present inquiry. Only then commenced the coast erosion which we now see; only then did our existing shingle-beaches and sand-dunes begin to form.

At first erosion was rapid, for the sea was merely eating into loose talus or into cliffs of little height; and protective banks of shingle and sand take time to accumulate. As the land is cut into, the cliff becomes higher and shingle-beaches and sand-dunes form, all tending to make the width of the strip destroyed annually less and less.

Of the land thus destroyed part is washed into deep water and lost, but much of the coarser material is rolled into shingle-beaches, or forms sand-banks and dunes. These form our best protection against further inroads. If the coast erosion is stopped, shingle, beach and sandbank will themselves wear out and disappear, and valuable low-lands behind may be spoilt by the sea.

Another compensation for the loss on the coast will be found in the great gain of alluvial land in the sheltered estuaries, but against this must be set the rapid silting-up of our harbours, even of those into which no streams flow.

Before we take for granted the desirability of attempting to stop the erosion of our coasts (except near towns) we must strike a balance between loss and gain. If the loss exceeds the gain there will still remain the question, Shall we obtain any sufficient compensation for the enormous cost of any works put up to protect agricultural land?

Some curious problems are suggested by this inquiry. Many may think them of no practical importance, but to the geographer and geologist they are of great interest. If what is said above is correct, and since civilised man has lived in Britain there has been a rapid change of sea-level followed by a long rest—what are the prospects of a similar period of rapid change again setting in? A new rise or fall to the extent of a few feet would have most disastrous effects on all our coasts and harbours, and would also seriously affect our inland drainage until things were adjusted to the new conditions.

* A paper by Clement Reid, F.R.S., read before the British Association at York.

THE CHALFONTS AND JORDANS.*

CHALFONT ST. PETER is a large village intersected by the river Misbourne. A few half-timbered houses, one or two gabled roofs and the ford across the river are perhaps the most striking and interesting survivals of a by-gone age. Fords—locally called splashes—are common in the neighbourhood. The church is of little architectural interest, but it is an admirable adaptation of a red-brick church of the last century. The old church collapsed on July 8, 1708, and a new one was erected in 1714. The church was more or less Gothicised by Street in 1854. He inserted Decorated windows and built an enlarged chancel terminating at the east end in a large window of five lights and divided from the nave by a broad and severely plain arch. The respective corners of the church are finished with stones brought from the ruins of the ancient city of Verulam. The church has several beautiful stained-glass windows of different dates. But the most interesting objects are the three memorial brasses which survived the rebuilding of the church. These, removed from the stones in which they were originally embedded, have been varnished over and placed so as to form part of the decoration of the chancel.

The centre brass in the north wall of the chancel depicts the figure of a priest in full vestments, A.D. 1545. It is a palimpsest, a figure of an earlier century having been altered to suit the change of costume. It bears the inscription:—"Of yor charite pray for ye soule of Sir Roberte Hanson, sumtyme Vicar of this Churche of Lytyll Myssenden, which deceased the XXVth day of August, A°. Dni. M^oV^oXLV., whos soule God pardon." At this time the tithes were the property of the monastery of Little Missenden. In 1539, when the monasteries were dissolved, the advowson of the living was bought from Henry VIII. for 594*l.* by Robert Drury. The Drurys were lords of the manor during the sixteenth century.

On the left of the centre brass are the figures of William Whappelode in full armour and his lady in the dress of the period, both with their favourite dogs at their feet. The figures are well executed, and the inscription runs:—"Here lies William Whappelode senior and Elizabeth, his wife, sometime the wife of William Restured, Esq., the which William Whappelode deceased on the 20th day of November, in the year of our Lord 1398, on whose soules God have mercy. Amen." The Whappelodes were lords of the manor for some time.

On the right of the centre brass are the figures of another of the Whappelode family and his wife. The inscription runs:—"Here lie William Whappelode and Margery, his wife, son of Sir William and Elizabeth, sometime the steward of the household of the most reverend Father in Christ, the most illustrious lord, the Lord Henry, Cardinal of England and Bishop of Winchester, which deceased on the 16th day of November, A.D. 1446, on whose soules God have mercy. Amen."

The church registers are singularly complete in their entries, and date from the year 1538, when they were first ordered to be kept by Act of Parliament. The early history of the parish of Chalfont St. Peter is very obscure. But it is mentioned in Domesday Book that the first lord of the manor was Lewin, a brother of King Harold. There is a very complete set of pewter Communion plate in the church.

A house called The Grange hard by the church was a noted place for secret meetings of the Quakers or Friends it being then in the possession of Pennington, who suffered much imprisonment for the sake of conscience. It afterwards became the property of the infamous Judge Jeffreys. Since then, however, it has been twice rebuilt. At one time it was occupied by a retired army officer, who insisted on being (temporarily, of course) immured in his own vault in the church, in order to satisfy himself that the air bricks inserted in the outer wall of the church would give sufficient ventilation. Strange to say he died a few days afterwards. At the cross roads near the village is an obelisk to commemorate George III. being in at the killing of a stag on that spot.

The church of Chalfont St. Giles stands near the south side of the village on very low ground. The building is an intermixture of flint, brick and stone, chequered, and consists of a nave with two aisles, a chancel and a square embattled tower at the west end. The north aisle is an addition to the original building and the round pillars have

been cut down to their present condition, though the bases of two of the pillars are still round. In the south wall is a four-foil-headed piscina, and the ancient approach to the rood-loft may still be traced in the piers. The square font has been cut out of a single block of stone. On the south walls are remains of frescoes. The beams of the nave rest on large carved corbel heads. The church as it now stands is principally Decorated and Perpendicular. The east window is Decorated, and is elegant and curious. Within the Communion rails is an altar tomb in memory of Thomas Fleetwoode, 1570. It is of dark coloured marble, having in front three circular compartments formerly charged with coats-of-arms. On tablets of brass affixed to a stone in the wall are the effigies, all kneeling, of:—(1) A man, (2) his first wife, (3) the four children by the first wife, (4) the second wife, and (5) the fourteen children by the second wife. The church is approached from the west through one of the most remarkable lych-gates to be met with in a day's journey. It is underneath the first floor of a cottage of which the massive oak beams may still be seen, the gate being of a turnstile pattern.

CHALFONT ST. PETER.

The secluded village of Chalfont St. Giles passed into the possession of Thomas Fleetwood in 1564. A member of this family, a Colonel George Fleetwood, was one of the judges of Charles I. He was subsequently convicted of high treason, and the estate was forfeited to the Crown. Chalfont House, once the ancient manor of the Brudenels, is situated in a beautifully wooded and undulating park, watered by the Misbourne, and contains one of the largest ash trees in England, measuring some 25 feet in circumference. Walpole was a frequent visitor here.

The mansion called The Vache is situated about 1½ miles from the church. In front is a brick building to the memory of Captain Cook. The parish church contains many memorials to the Lords of the Vache, as its successive owners have been known. Close to The Vache are the remains of an ancient monastery, the chapel of which served for the inhabitants of the house. The village of Chalfont St. Giles is, however, most interesting as the place of refuge chosen by John Milton in 1665, when the plague was devastating London. The house—a humble half-timbered cottage—in which he lived, "a pretty box," as he himself called it, was hired for him by his friend Ellwood, the Quaker. Ellwood had been introduced to Milton in 1662. In order to improve his scholarship he had offered to read Latin works to the blind poet, who in

* Read by Mr. Arthur J. Pitman at a meeting of the Upper Norwood Athenæum on June 23.

return assisted Ellwood in his studies. Ellwood afterwards became a tutor in the family of the Penningtons, was closely associated with the Quaker sect, especially with George Fox and William Penn, and was buried at Jordans. The cottage in which Milton lived is now preserved for the use of the public, having been bought by public subscription in 1887 as a memorial of the fiftieth year of Queen Victoria's reign, after many proposals had been made to purchase the house with a view to its removal and re-erection in America. It is the only house connected with Milton which still exists, and it is in almost the same state as when Milton lived there. It is supposed to have been built by one of the Fleetwoods, as their arms appear over the door. The porch, where we can imagine he sat and conversed with his friends, has disappeared, having decayed with the process of time. Inside the old-fashioned diagonal chimney has been replaced by a square one. The largest room, that nearest the road, is very possibly as it was in the poet's tenancy, while the mantel-piece in the room on the other side of the porch dates at least from his time. Altogether it is extremely probable that this residence is the scene of

MILTON'S COTTAGE.

many of the happiest events of Milton's later life. It is related that on the occasion of one of Ellwood's visits Milton handed to him the complete manuscript of "Paradise Lost." When he had read it Ellwood observed, "Thou hast said much here of Paradise Lost, but what hast thou to say of Paradise Found?" When Ellwood called on Milton a few months later in London he was shown the second poem, called "Paradise Regained," and Milton added, "This is owing to you, for you put it into my head by the question you put to me at Chalfont, which before I had not thought of."

It may be mentioned that Chalfont St. Giles is the home of the Middlesex cricketers—the Hearnies.

Jordans, or Jourdans, is the name given to the meeting-house and burial-ground which have so many intimate connections with the Society of Friends, more popularly known as the Quakers. The whole district teems with associations with the religious sect which cultivated so many ideas of civil and religious liberty, and whose advocacy of the abolition of slavery and of the reform of prisons must for ever redound to the honour of people whose lot for a long time was to suffer bitter persecution and horrible punishment. It would be difficult, perhaps, to find a spot of greater seclusion so near to the busy life of London. But the solitude of its position serves only to add to the grandeur of the simplicity which the place suggests. The meeting-house was built about 1679, and the oak benches and rostrum remain as they were in the beginning. When one reflects on the great and noble persons like William Penn, George Fox, Pennington, Elizabeth Fry, and others of the sect who have worshipped in the meeting-house, and have expounded when, as they quaintly put it, they were "moved by the Spirit," one cannot but agree that in spite of the absence of marble pile, mural tablet or coloured window the place is fitly called the "Westminster Abbey of the Quakers" and the "Mecca" of the great majority of Americans who visit this country. On the walls are to be seen a list of the 385 burials in the adjoining ground and a list of the marriages solemnised in the meeting-house. Opposite the rostrum and high up the

wall sliding shutters are to be seen. The exigencies of the Stuart period necessitated some such arrangement. For we read that it was no uncommon occurrence for the house to be surrounded with soldiers and for the worshippers to be taken away to durance vile. It was therefore the custom for the men folk only to occupy the floor of the meeting-house, the women occupying the room behind the sliding shutters; and this room being part of the dwelling-house rendered its occupants free from molestation. It is not to be wondered at that the Quakers adopted any possible device for saving their women from the horrors of imprisonment, however short the time, when we consider the kind of place a prison was. For instance, the prison in Nottingham was simply a hole in the ground beneath the jailer's rooms, with no provision for the necessities of life, and in which filth indescribable accumulated on the floor day by day. The sexes were not separated, and gentle lady was herded with ruffian—murderer or what not. It is indeed wonderful that anyone ever came out of such a place alive. The place where the horses were stabled is still to be seen.

In the graveyard are a few stones marking the burial-places of some Quakers, but the vast majority are unmarked. The most noteworthy grave is that of Wm. Penn and his wives and children. And it is Penn's grave which forms so great an attraction. For Penn was the author of a code of laws so simple and making for such a large measure of civil and religious liberty that it would have done honour to the profoundest legislators.

William Penn, the founder of Pennsylvania, and son of Admiral Sir William Penn, was born in the Liberty of the Tower, London. Although educated at Oxford and accustomed to mix with persons of high social degree, he rapidly became impregnated with Quaker habits and modes of thought, and suffered imprisonment for resistance to various Acts of Parliament which ran counter to his conscientious beliefs. The influential position of his father at Court was the means of large tracts of country on the other side of the "herring pond" being granted to the family. One extensive tract was named "Pensilvania," in honour of the admiral. As proprietor and governor of Pennsylvania and the adjacent territories, Penn was invested with executive as well as legislative power, and the Constitution he created for the governing of these territories was framed on the largest basis of civil and religious liberty. He settled the lands to a very large extent with people of his own persuasion, who were only too glad to be under the rule and governance of one who was so much in sympathy with their views. When Pennsylvania was invested with all the rights and privileges due to its position as a State, the interests of the Penn family were commuted for an annuity. His declining years were, however, embittered by disputes between the various occupants of the lands and by the misdeeds of his son and of his steward, which brought pecuniary embarrassments. Finally, an apoplectic seizure ended in death on July 30, 1718. It is tolerably certain that the memory and acts of Wm. Penn will be commemorated as long as the United States of America shall last. His two wives and several children were interred beside him, and in the enclosure we have seen to-day lie many others whose memories are cherished by that band of people—at once so peculiar and yet so high minded as to compel the admiration of the whole of the civilised world. The conditions of the trust require that services shall be held at least once every year, and the last Sunday in May is the annual day on which the Quakers foregather to commemorate their glorious past.

ENGINEERING LABORATORIES, EDINBURGH.

A PAPER was read by Professor T. Hudson Beare at York on the block of buildings completed in the early part of the present year for the Engineering School of Edinburgh University, and gave details of their equipment.

The building is T-shaped, the head of the T facing west. In the head of the T, on the ground-floor, are provided large laboratories for the testing of materials and for hydraulics. The first floor is devoted mainly to a laboratory for experimental work which does not require heavy machinery. On this floor there are also a small lecture-room, the departmental library and the private rooms for the staff.

The back block of the building is also divided into two floors: the lower forms the lecture theatre and the upper the drawing office. The lecture theatre will seat about 120

students, and on the lecturer's table are all the needful appliances for experimental demonstrations, there being steam, gas and electrical connections. There are also the necessary appliances for darkening the room in order to allow of the free use of lantern demonstrations. The drawing office is a fine room, about 45 feet square, lit entirely from the north and east, the roof being of the saw-tooth pattern, the floor-space giving room for about sixty independent drawing-tables. Special rooms have also been set aside for blue print-work and photography.

A workshop and heat laboratory has been provided for by roofing in and connecting to the main building a piece of ground lying to the north-east of the main building. The workshop and laboratory contain examples of all the ordinary machine-tools, gas-engines, steam-engines and other plant for experimental research in connection with thermodynamics.

The building is heated by hot water and by steam: an independent boiler-house has been constructed for this purpose, with two large boilers.

A considerable amount of additional apparatus has been installed in these new buildings. The testing laboratory now contains a 100-ton Buckton machine, with the necessary electric motor, pump and accumulator; a 60,000-lbs. Riehle machine; an Amsler 100-ton machine, specially designed for compression and bending work; and a complete installation for the testing of cements, mortars, &c.

In connection with the hydraulic laboratory a water tower has been constructed at the south-east corner of the building; at the top of this tower is a large cast-iron tank, holding about 10,000 gallons, and giving a head of 65 feet above the floor-level of the laboratory. The floor of the laboratory is on two different levels: on the upper level are placed the various turbines, water-wheels and other hydraulic machines on which experimental investigations will be carried out. The water discharged from these machines passes into one or other of three rectangular channels formed in the floor, and the quantity is measured by allowing the water to pass over weirs. The water then flows into one or other of two large rectangular tanks, each 11 feet square by 5 feet deep, sunk below the lower floor-level of the laboratory, where it is measured again by floats, with rods moving in front of carefully graduated vertical scales. From these lower measuring tanks the water is lifted by an electrically driven 20 horse-power centrifugal pump back to the storage tank in the water-tower. The hydraulic equipment includes a Venturi meter and other forms of meters and a considerable amount of other apparatus for experimental work.

The paper was illustrated by a considerable number of lantern views.

SCOTTISH ECCLESIOLOGICAL SOCIETY.

THE members of the Scottish Ecclesiological Society recently visited Dunglass and Cockburnspath. The party first visited the old church at Dunglass, by permission of Sir Basil and Lady Hall, under the guidance of Mr. Ross. The church is in a state of almost perfect preservation. It is built in the form of a cross, the longer limb being about 100 feet long and the shorter about 70 feet, with a chapel or sacristy on the north side. The stone-vaulted roof is entire throughout, and no timber was used in the construction of the edifice. There are several beautiful details in stonework, in particular the sedilia, divided into three seats by arched canopies richly carved. Several windows have their tracery entire. There is a central tower supported on four piers of singular form on plan, with fine connecting pointed arches. There are several coats-of-arms. One, an impaled shield, has the Home arms and the arms of the Pepdies. The church was founded in 1403, and was probably in course of erection in 1556, when Pope Nicholas granted relaxation of penances to such as yearly visit the college kirk of Dunglass. About the same time Patrick Hume of Powlert, with his wife, Helen Schaw, endowed a chaplain to celebrate mass and for chanting, principally at the altar of St. Cuthbert situated in the south aisle. There are several carvings in the church representing angels playing on musical instruments. In the very throes of the Reformation things appeared to have gone on here just as they had always done. Only a few years before the settlement of the Protestant Church, Lady Huym, also lady of the life-rent of Dunglass, commanded the provost, Abraham Crechoun, to install Sir Hugh Hudson as one of the prebendaries of the church, and to give him possession of the manse and garden belonging to the pre-

bendary, "taking his oath as is customary by touching the holy gospels of God," and a fortnight later he was duly admitted at eight in the morning by tendering to him the Bible and taking his oath. Even 20 years after the Reformation the Church appears to be going on in the old way. The old clergy who remained faithful to the Church were allowed for their lifetime some pittance, more or less, but there seems here to have been new provosts and prebendaries appointed till a late time. Adjoining the church is the mansion house, on the site of an ancient castle. A great tragedy took place here in 1640, when a party of Covenanters under the Earl of Haddington held the castle. Some of them taunted an English page about their superiority to his countrymen, when he ignited a barrel of gunpowder stored in the building, the consequences of which were dreadful, many being killed. In Cockburnspath, the village adjoining Dunglass, there is also an interesting church. The Rev. G. V. Dunnet, minister of the parish, acted as guide to the party on their visit. The church has not fared so well as Dunglass, but it has some interesting features, specially a round tower at the west end, which projects half outside and half inside, and rises a stage above the roof. This tower is old, but it is not easy to fix a date. Some other portions of the church exhibit work probably contemporary with that of Dunglass.

EXPLORATION IN EGYPT.

AMONG the papers read before the British Association was one by Professor W. M. Flinders Petrie, F.R.S., on "The Hyksos and other Work of the British School of Archaeology in Egypt."

A great earth-bank camp, twenty miles north of Cairo, proves to belong to the Hyksos or Shepherd Kings, who held Egypt from about 2400 to 1600 B.C. The camp is about 1,500 feet across, the bank 100 to 200 feet thick and over 40 feet high. The outside was a great slope of white stucco 60 to 70 feet high, and the entrance was a long slope of over 200 feet ascending over the bank. No such fortification is known before in Egypt. Within a year or two the defenders threw out flanking walls to command the sloping roadway. All of these works are only suitable for archery defence. Two or three generations later, when the stucco face was decayed, an entirely different system was adopted. An immense wall of fine limestone, 45 feet high, 6 feet thick and over a mile long, was built outside of the bank, which thus ceased to have any slope, and became a walled city. This all accords with Manetho's history, these archers having overcome the Egyptians without a pitched battle, just as the Parthians later destroyed the Roman army. And after a century the Hyksos built a great and mighty wall round their camp at Avaris, which is probably the structure here discovered. The cemetery of the Hyksos shows that there was a continuous degradation of work in the scarabs during this age. Hence it is possible to begin a systematic arrangement of all the names on Hyksos scarabs, which comprise the greater part of the kings of that race. They appear to have been Semites who came from the region between Syria and Mesopotamia, and they were pushed forward into Egypt and Cyprus by a migratory movement. The full details of this and the following discoveries will be found in "Hyksos and Israelite Cities," large edition, the annual volume of the British School. Other work has brought to view the store city of Raamses, built by the Israelites along with Pithom, and the cemetery of the city of Goshen.

The town and temple built by the high priest Onias has also been found, and it fully substantiates the accounts given by Josephus about this interesting migration of the Jews into Egypt in the second century B.C.; and a later cemetery at Gheyta shows how Eastern influence was filtering into the country before the great Arab conquest.

The Linlithgow Town Council recently communicated a suggestion to H.M. Office of Works as to the re-roofing of the Parliament hall of Linlithgow Palace. A reply was received in the following terms:—"Westminster: July 17, 1906. Sir,—Your letters of May 3 and 9 last addressed to Mr. W. T. Oldrieve, of H.M. Office of Works, Edinburgh, having been submitted to the Board, I am directed by the First Commissioner of His Majesty's Works, &c., to inform you that there is at present no practical proposal under consideration for the restoration of any part of Linlithgow Palace for actual occupation.—I am, your obedient servant, W. J. DOWNER."

NOTES AND COMMENTS.

WHEN PERRAULT was able to fascinate LOUIS XIV. and his Minister COLBERT with his design for the façade of the Louvre opposite the church of Saint-Germain l'Auxerrois the ground between the building and the street was not supposed to be as level as it is at present. The designs show that there were trenches which were intended to suggest that the palace was a building which might stand a defence in an emergency. Some time ago we stated that M. REDON, the architect who has now charge of the Louvre, had discovered the existence of the trenches, which are still in a perfect state, and can be turned without difficulty into a decorative feature. His recommendations required a long time to consider. But at length the French Government have approved of them. The ground along the fronts to the Quai, the Rue de Rivoli and the Place Saint-Germain l'Auxerrois will be excavated, and in the course of a few months the eastern part of the palace will be seen standing on a substantial substructure, with a trench or fosse strengthened by counterforts outside it. It is anticipated that the appearance of the buildings will be improved.

WHEN a building is let out to different tenants, all of whom have a right to use the entrance-hall and staircases, the landlord cannot so restrict the space occupied by the entrance-hall that the reasonable enjoyment of the property demised will be impeded. On the other hand, if the entrance-hall is larger than is required by the tenants, they cannot prevent the landlord from utilising in any way he sees fit the surplus space. These principles were illustrated by the case of *F. C. STRICK & Co. v. The City Offices Company, Ltd.* The plaintiffs were tenants of offices in Baltic House, 27 Leadenhall Street. The building had an entrance door 10 feet wide, leading to a hall 17 feet 9 inches wide, opening by an archway 6 feet wide into another hall also 17 feet 9 inches wide. The landlords intended to use part of these halls, and thereby to diminish their available width. The plaintiffs insisted that they had a right to pass over the whole space of these halls, and applied for an injunction to prevent the landlords from proceeding with their scheme. SWINFEN-EADY, J., held that the plaintiffs could only restrain the landlords from proceeding with their scheme in so far as their reasonable right of passage was impeded. In such a case the plaintiffs had not the right to go over every square inch of the hall. They only had the right to a way of dimensions necessary for the proper conduct of their business.

THE Governor of California, immediately after the earthquake of April 18, appointed a commission of professors and geologists to investigate the subject. The evidence was too apparent of the extent of the area of the movement by an examination of the surface of the ground. But the commission may also be said to have defined its depth. The first shock was recorded at one of the observatories at 12 mins. 6 secs. past 5 A.M., and between that hour and 7 P.M. there were thirty-one shocks. A line of rift can be traced, and there was destruction on either side of it for a distance of from twenty-five to thirty miles. In the city of San Francisco the commissioners say there were four types of ground — (1) the rocky hill slopes, (2) the valleys between the spurs of the hills which have been filled in slowly by natural processes, (3) the sand dunes, (4) the artificially filled land on the fringe of the city. The greatest destruction was among buildings erected on the made ground. The filled-in material and the swampy foundation upon which it rests behaved as a mass superimposed upon the earth's surface, rather than as a part of the elastic crust itself. On the rocky slopes and ridge tops, where, for the most part, the vibration communicated to buildings was that of the elastic under-

lying rocks, the destruction was at a minimum. On some of the hills chimneys fell very generally and walls were cracked; on others even the chimneys withstood the shock. It is remarkable that while the made ground in the vicinity was profoundly disturbed, steel structures of "Class A" were relatively passive. Thoroughly bonded and well-cemented brick structures, on deep and solid foundations, seem to have been equally competent to withstand the shock, except for occasional pier-like walls not well tied to the rest of the building. Wooden frame structures suffered through the effect of underpinning and bracing, especially when found on made ground. Pipes laid on made ground also suffered more than those on a rocky bed, except in the immediate vicinity of the rift. The commissioners suggest an acceptance of the geological conditions, and that costly public buildings should be erected on sites as near as possible to the rock. They believe it was owing to the State University at Berkeley being founded on rock that the buildings were practically uninjured. The report will be likely to delay the creation of a new San Francisco, and temporary buildings may have to serve for some years as in the primitive days of the city.

THE Pont de Saint-Pères in Paris has to sustain a very large amount of traffic, as it leads from the gateway in the Place du Carrousel to the Rue de Saint-Pères. It is a cast-iron bridge, and was erected seventy years ago under the direction of POLONCEAU. At the extremities four immense statues were placed in 1847. The sculptor was PETITOT, and the figures represent Abundance, Industry, the Seine and the City of Paris. It has been found necessary to renew the roadway, for the wood-paving had become decayed and was in a dangerous condition. M. RESAL, who has charge of the works, will have the whole surface laid in iron on which wood blocks will be set. The roadway will be brought nearer to the horizontal, and bracing will be introduced to prevent the movement of the bridge, which, although not uncommon with cast-iron bridges, is sometimes disagreeable. Originally no provision was made to support the weight of the statues, for they were not comprised in POLONCEAU's design. They will be removed, and it will therefore become more easy to improve the approaches. The statues will be sent to the Dépôt Auteuil, where they will find themselves making part of a very large company of similar works which have fallen out of favour. The paving is to be carried out with expedition.

THE London Public Health Act, 1891, imposes upon the sanitary authority the duty of removing house refuse, and for neglect of this duty renders it liable to a penalty not exceeding 20*l.*; but it is under no obligation to remove trade refuse without payment. In the case of the Mayor of Westminster v. Gordon Hotels, Ltd., the question arose whether the ordinary refuse of a large hotel was house refuse, which the sanitary authority was bound to remove, or whether it was trade refuse, which it was not bound to remove. It is clear that if the distinction was drawn by asking whether the refuse was produced by the ordinary user of the house by a tenant or tenants, or whether it was produced by the user of a house for the purpose of carrying on a trade, the refuse in question was trade refuse. But to solve the question in this manner would give rise to many insoluble difficulties. What, for instance, would be the position of a person who kept a boarding-house, who let furnished apartments, or who entertained paying guests? Accordingly, the Court laid it down very sensibly that the distinction between house and trade refuse must be drawn by reference, not to the mode in which it is produced, but to the character of the refuse itself. If it is "produced by a house in the way in which a house is ordinarily used" it is house refuse and not trade refuse.

CITY HALL, BELFAST.

IRELAND, unfortunately, has not been for a long period in a condition that could be considered as favourable to the production of architectural works. The completion and opening of the new City Hall, which took place on Wednesday of last week, deserves to be considered as an historic event. As the Lord-Lieutenant of Ireland said on the occasion:—

It is a day for congratulations and for rejoicing, rejoicing, not of a superficial or complacent sort, but rather the rejoicing of thankfulness, high hopes and purposes. Just as it is the chief glory of this splendid edifice that it is characterised, not merely by magnitude, but by beauty and grace, so it is the case that the true greatness of any community or State consists, not mainly or wholly in the magnitude of its resources of wealth and population, but rather in the tone and spirit which pervade its affairs and influence. So to-day we feel that the occasion is not only one for gladness, but also one of high hope and expectation and the most profound good wishes. Heartfelt, indeed, are the wishes which we with united hearts offer to-day. May the massiveness of this noble structure typify the sure and stable foundation of the prosperity and welfare of this great city and community; may the beauty and grace of the design and execution of this building and its artistic features symbolise and more than symbolise the culture and all that is best in public and private life, the promotion of all that is true and lovely and of good report.

The building was erected from the design of Mr. BRUMWELL THOMAS, of Westminster, and the contract was carried out by Messrs. H. & J. MARTIN. In the construction 25,000 tons of Portland stone from the O.P. quarries of the Bath Stone Firms have been employed. The principal front has a length of about 300 feet. The towers at the angles have a height of 115 feet, and the dome rises to 173 feet. The entrance hall measures 70 feet by 40 feet. Marbles have been used for the construction of the staircase. The council chamber measures 68 feet long by 38 feet wide. It is provided with balconies, and the seating is arranged as in the House of Commons. The great hall, which is 120 feet in length, will accommodate about 1,000 people, and there are in addition galleries for 250. There are several stained-glass windows by Messrs. WARD & CO., of Belfast. The entire equipment of sanitary appliances was entrusted to Messrs. GEORGE JENNINGS, of Lambeth, comprising their special Century closets with syphonic discharge, "tip up" and "lift out" lavatory basins in marble, and latest improved type of urinals.

SOLDIERS' WAR MEMORIAL, BIRMINGHAM.

THE memorial we illustrate was recently unveiled in Cannon Hill Park, Birmingham. It was designed and executed by Mr. ALBERT TOFT, sculptor, and is not only admirably composed, but is also expressive of its purpose—which is not always the case with English memorials. The uppermost figure represents Peace, who is supposed to be crowning Courage and Endurance. As the *cire-perdue* process was adopted the sculptor's modelling has been reproduced to perfection. The pedestal, which is of an architectural character, is constructed of granite; each of the four faces has a bronze panel. The front or dedication panel is made to be suggestive of grief by two kneeling figures. At the corners of the buttresses wreaths and shields are introduced, inscribed with the names of the battles in which the Birmingham warriors took part.

CATHEDRAL SERIES.—ST. DAVIDS: THE TRIFORIUM AND CLERESTORY FROM TOP OF ROOD-SCREEN.—THE ROOD-SCREEN.

THE screens of St. Davids Cathedral are of great interest. According to the description by Messrs. JONES and FREEMAN, the choir was divided into three parts to correspond with the three grades of the clergy, viz. the bishop or dean, precentor, chancellor, treasurer; next the four archdeacons and the holder of the golden

prebend; then the curial prebendaries and non-capitular members. Last week we published a view of the sanctuary screen which divided the stall choir from the more eastern part containing the altar. The screen now illustrated separates the chancel from the nave, and is necessarily of a more solid character. The appearance of the screen prior to the restoration may be inferred from the following description:—"The rood-loft projects a little into the nave; it is a very rich example of the Decorated style, but is very much disfigured by some mean ordinary paling running along the top, and a clock face within a lozenge-shaped wooden frame in the middle. This rood-loft shuts out the transept from the nave; in the centre of it is the entrance into the choir, under a pointed archway which is elegantly vaulted; the arch towards the choir is filled up with mean wooden doors having a fanlight above them, very similar to what is frequently seen in taverns." The second illustration represents mainly the peculiar triforium and clerestory, as well as the very elaborate if unsuitable timber roof. The cathedral was originally intended to be vaulted. The marked contrast between the interior and the exterior of the cathedral must strike every visitor. Standing outside one receives the impression that the building is in the severest form of Romanesque. But within the amount of ornament is almost sufficient to dissipate the belief, for we seem to have a building of a Transition type in which the Gothic element was predominant.

NEW OFFICES FOR THE HEARTS OF OAK BENEFIT SOCIETY, EUSTON ROAD, N.W.—BASEMENT.

HOUSE, REIGATE, SURREY.

THIS house has been erected on the well-wooded Manor Road estate, at the foot of the North Downs, and commands extensive views along this range to Guildford and beyond; to the south views of the Weald and the South Downs are obtained. The lower portion of the house and chimneys is of local red brick; the upper part is covered with rough-cast of a cream tint, except over the kitchen quarters, which is tile hung. The gables are treated with solid half-timber work and brick-filling, left rough from the saw and dressed with Stockholm tar. The tiles are red, hand-made and sand-faced. The chief internal features are the hall sitting-room and dining-room inglenook. The builders were Messrs. C. NIGHTINGALE & SONS, of Reigate, and the architect Mr. C. E. SALMON.

EXCAVATIONS AT SPARTA.

THE work of the British school at Sparta in 1906, according to Mr. R. C. Bosanquet, M.A., F.S.A., has been to survey the site and investigate the Romano-Byzantine fortress. Parts of the Hellenic town wall have been discovered and traced, and general conclusions have been formed as to the extent and disposition of the town at different periods. The sanctuary of Artemis Orthia has been examined and the stratification of a "geometric" and a "Corinthian" layer determined. Ivories, lead figurines and grotesque clay masks have been found, the last affording evidence as to naturalism in archaic Spartan art. The later Hellenic period is a blank; in Roman times there was a further development of the cult, and numerous votive inscriptions recording musical and athletic victories of Spartan boys in the second century A.D. have been found. In the third century A.D. a theatre-like building was constructed in the *temenos*, the proscenium of which was the front of the temple.

Mr. William Mitchell, hon. secretary of the Cockburn Association, has prepared a memorandum on the subject of the National Galleries Bill. He suggests the completion of the National Monument on the Calton Hill, Edinburgh, for the National Gallery.

BRUCE HOUSE.

THE site of the building, which is the latest effort to provide a municipal lodging-house on a large scale, has an area of about 28,171 superficial feet, and has a frontage of about 220 feet to Kemble Street, 108 feet to Drury Lane and 139 feet to Kean Street. The plan of the building is E-shaped above the ground floor, so arranged as to provide adequate light and air to the cubicles. The building is six storeys in height. The elevations are of red brick facings, relieved with glazed and Luton bricks, stonework and rough-cast, and the roofs are covered with green slates. The ground floor (lodgers' section) comprises spacious dining-room (including hot chamber and lodgers' crockery store), smoking-room, reading-room, writing-room, locker-room, parcels-room and w.c.'s and urinals for the use of lodgers. The ground floor (administrative section) comprises office, superintendent's quarters, clerk's bedroom, female staff sitting-room and bedrooms, porter's day room and shop.

The basement (lodgers' portion) comprises lavatory, feet washing-room, baths, dressing-rooms, lodgers' wash-house, boot brushing-room and barber's and bootmaker's shops. The basement (administrative portion) comprises establishment scullery, kitchen, bread and milk store, larder, crockery store, shop store, general store, bedmakers' day-room, soiled linen-room, clean linen-room, establishment laundry (including drying chambers, one being set apart for mattresses), ironing-room, heating chambers and coal stores, and a disinfecting chamber.

The upper storeys, comprising 709 cubicles (with sanitary appliances on each floor), afford accommodation for 699 lodgers and ten porters. On the ground-floor there is a room facing Kean Street, which it is proposed to let for commercial purposes.

The dining-room has a floor area of 5,177 feet, including the space around the hot plate. Fixed teak tables and seats

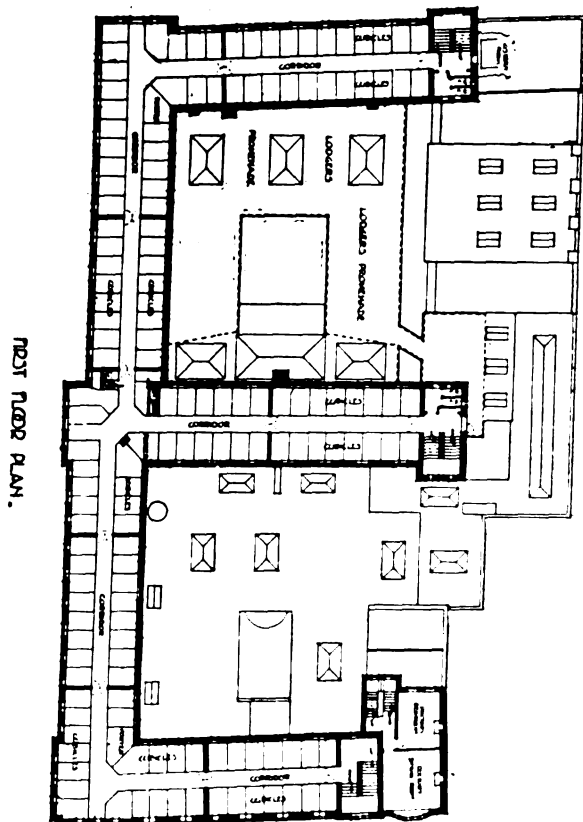

are provided to accommodate 360 men at one time. Near the middle of the room a spacious open chamber is provided for a large hot plate, at which lodgers can, if they desire, cook their own food. Sinks, with hot and cold water, are provided in two recesses off this chamber, where food can be prepared for cooking. A cylinder is fixed at each end of the hot-plate chamber with a constant supply of hot water for making tea, &c., and there are also two large cooking ranges. The lodgers' crockery store is placed on the north-east side of the dining-room.

The smoking-room is arranged on the main frontage, at the corner of Kemble Street and Drury Lane, and has a floor area of 1,907 superficial feet. Fixed teak tables and seats, accommodating ninety-six men, are provided in addition to movable arm-chairs. The room is heated by means of two open fireplaces, with special provision for the discharge of warm air. The reading-room is approached from the two main corridors, and has a floor area of 2,720 superficial feet. Fixed seats and tables are provided to accommodate 136 men, in addition to a number of movable arm-chairs. Two polished teak bookcases are placed on the east wall of the room, containing books for the use of lodgers. Three open fireplaces, with special provision for the discharge of warm air, are provided, and the room has a central open area which is accessible to lodgers. A special waiting-room is provided, approached from the reading-room. It has a floor area of 317 superficial feet, and will comfortably accommodate twelve men at one time. This room is heated by means of two steam radiators.

The locker-rooms are approached from the main corridor at the rear of the dining-room. They are fitted with 690 sheet-iron lockers, with teak doors. The parcels-room is approached from the main corridor, and is fitted with shelving for lodgers' boxes and parcels. The water-closets and urinals are approached through a disconnecting lobby

at the end of the main corridor. There are thirty-four water-closets and eight urinals.

The first-floor flat over the dining-room and portion of locker-room is railed off for use as a promenade for lodgers, garden seats being provided. It is approached from the central staircase. (The portion of the building over the basement contains four storeys of cubicle floors, and the remainder five storeys.) Each cubicle floor is divided into sections by division walls, which admit of the isolation and disinfection of sections in the event of contagious disease, and would also check the spread of fire.

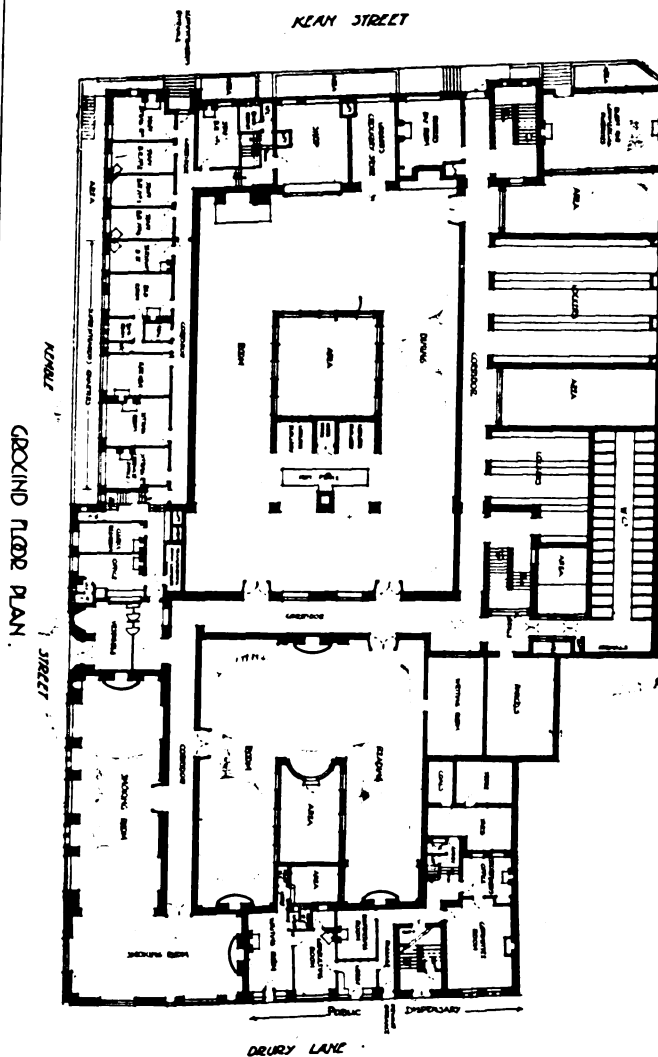

BASEMENT PLAN.

Each lodger has an independent cubicle having a minimum width of 4 feet 10½ inches, and an area of 36 superficial feet, and is lighted by a separate window. The height of the storeys from floor to ceiling is 9 feet, with the exception of the top floor, which is 8 feet 9 inches. The partitions between the cubicles are 7 feet 6 inches in height, that portion adjoining the corridor is 6 feet 6 inches in height, thus insuring ample ventilation. The cubicle partitions are framed wood with panels which can be taken

out and replaced if necessary without disturbing the framing. Each cubicle contains an iron bedstead with spring mattress, the whole of which can be folded back against the partition for the purpose of readily sweeping and cleansing the floor.

There are two principal staircases leading to the cubicles, and, in addition, one emergency staircase. These are so arranged as to make it practically impossible for any part of the cubicle corridors to be cut off from one or more of the staircases in the event of fire. Iron grates, fitted with panic bolts, are provided to the staircases to prevent lodgers having access to the cubicles during prohibited hours. Teak doors have been provided on the landings of the staircases in order to check the spread of fire from one floor to another, and each staircase is fitted with a fire hydrant with hose pipes at the level of each cubicle floor.

There are four w.c.'s on each floor on the staircase landings for night use, with the exception of the top floor, where two w.c.s are provided. Taps for drinking water are also provided at these landings.

The office, situated on the left of the entrance, is provided for the clerk, who is responsible for the issue of all tickets and keys to the lodgers and the giving of general information. The clerk is provided with a bedroom and lavatory accommodation adjoining the office.

The superintendent's quarters comprise superintendent's office, two sitting-rooms, two bedrooms, bath-room, &c. A private staircase leads to the first floor.

The surfaces of the walls in the principal corridors, staircases, lavatories, kitchens, cold stores, &c., have been finished in glazed bricks or tiles. The public rooms generally have dadoes of coloured tiles 7 feet 9 inches high. The reading and writing-rooms are provided with picture panels of prints framed in teak. The smoking-room has coloured pictures, similarly framed, and in the dining-room coloured tile pictures with tile frames are provided. The floors of the principal rooms are laid in wood blocks on concrete. The fireplaces to the reading and smoking-rooms are designed in coloured glazed tiles, with Hopton wood stone

dressings and mantel shelves. The floors and staircases throughout are of fire-resisting construction.

Mr. W. E. Riley, the Council's architect, has prepared the designs and superintended the work of construction throughout. Mr. Maurice Fitzmaurice, C.M.G., the chief engineer of the Council, has been responsible for the hot-water installation and the electric lighting.

The lodging-house is named after Mr. W. Wallace Bruce as some recognition of the many years of devoted work which he has given to the subject of housing in London. Mr. Bruce has been five times chairman of the housing of the working classes committee and has been a member of the committee for fourteen years. Mrs. Wallace Bruce kindly performed the opening ceremony.

THE LAKE VILLAGE AT GLASTONBURY.

THE eighth report of the committee for investigating the Lake Village at Glastonbury, consisting of Dr. R. Munro (chairman), Professor W. Boyd Dawkins (secretary), Sir John Evans, Dr. Arthur J. Evans, Mr. Henry Balfour, Mr. C. H. Read and Mr. A. Bulleid, which was presented to the British Association, states that the excavations were reopened this year, again under the joint superintendence of Mr. Arthur Bulleid and Mr. H. St. George Gray. Digging began on May 7, and was continued for four weeks until June 2. Two days were lost on account of heavy rain, and much inconvenience was experienced from the consequent flooding of the trenches. The percolation of water from the peat and the excavated ground of former years adjoining the digging necessitated the continued use of a pump. The area explored covered some 580 yards, and was situated at the north-west corner of the village, lying to the east and south of the piece of ground examined in 1905. During the digging this year another dwelling-site was discovered, hitherto unrecognised, bringing the total up to 83.

The number and the variety of the "finds" were well up to the average, and the structural discoveries were of exceptional interest and importance. Dwelling mounds 67, 74, 76 and 83 were explored in their entirety; Mounds 68, 71 and 72, partly excavated in 1905, were completed; the larger part of Mound 73 and the north-west quarter of Mound 75 were examined and await completion next year. As in former seasons, numerous photographs were taken and sectional and ground plans were made. The following points of interest were noticed in the different mounds:—

Mound 67.—This dwelling-mound was of medium size, and formed one of a group of six situated at the north-west corner of the village, lying east of Mound 68 and north-east of Mound 83. It was protected along the north, north-east and east aspects by the border-palisading, and was composed of four floors. The greatest diameter of the mound east and west was 25 feet, the total thickness of clay near the centre being 2 feet 7 inches. The whole mound was tilted downwards and outwards towards the palisading on the east of the dwelling. The substructure was strong and well preserved, especially under the east and north-east sides of the dwelling. The upper layers of timber were arranged in an east and west direction, the deeper layers being placed at right angles to these and parallel to the palisading. Thick layers of brushwood supported other parts of the dwelling-floors. Portions of an older and discarded palisading were discovered in the peat underlying the south-east quarter of the mound. The peat situated south of Mound 67 was composed of a heterogeneous mass of vegetable *debris* containing chips of wood, stones, bones of animals (including the nearly complete skull of a horse), and quantities of coarse hand-made pottery.

Floor I. was composed of yellow clay, and measured 13 feet 6 inches east and west. The hearth was well preserved, and consisted of a raised patch of baked clay measuring 4 feet 3 inches east and west, on the surface of which a well-arranged central area of lias slabs 3 feet 3 inches in diameter was embedded. The hearth was much tilted towards the east, the difference in the level of the east and west margins being 6 inches.

Floors II. and III., which were composed of yellow clay, had no hearths. A layer of peat and timber, 1 foot in maximum thickness, separated Floors III. and IV. in the east half of the dwelling.

Floor IV. was composed of grey clay, and at the south-west margin was continuous with the clay of Floor I. of Mound 83. Towards the north and east aspects of the mound the clay extended as far as the palisading. No hearth was discovered on this floor.

Mound 68.—This dwelling-mound was of small size, situated near the north-west border of the village, south-east of Mound 69, east of Mound 70 and north-west of Mound 83. It was protected along the north and north-east sides by the border-palisading and was somewhat quadrangular in outline. It was composed of three floors, the greatest diameter of the mound being 24 feet east and west, and the greatest thickness of clay 17 inches.

Floor I. was a small area of clay, 9 feet in diameter east and west, with a central hearth composed of a raised patch of clay with waterworn sandstone pebbles embedded in the surface. The diameter east and west of the stoned area measured 18 inches, and that of the clay portion was 4 feet at the floor-level. Floors II. and III. were of greater extent, with no indications of having had hearths. This mound contained an average quantity of pottery. Several pieces of thin grey Romano-British pottery were found on the surface of the mound, immediately under the flood soil, and one piece in the black earth belonging jointly to Floors I. and II.

Mound 71.—The greater part of this dwelling was examined and described in the 1905 report. The small section of the mound remaining along the east side was completed. The diameter of the clay floors was 22 feet east and west; the east margin of the clay overlapped Mound 83 to the extent of 8 feet. The well-preserved and arranged timber substructure noticed last year did not reach the east margin of the mound. No additions were made to the list of objects enumerated last year.

Mound 72.—This dwelling was partially excavated in 1905. It was composed of three floors and situated near the west border of the village. Nothing particularly noteworthy was found in the construction of the mound beyond that described last year.

Mound 73.—This was a large-sized mound, quadrangular in outline, with the greatest diameter lying north-west and south-east. It was situated south-west of Mound 74, south of Mound 71 and north-east of Mound 76. It was composed of two layers of clay, the upper being 18 inches thick at the centre and continuous at the east margin with Mound 74, and along the west side with Mound 76. Indications of a baked-clay hearth were noticed on the surface of the clay towards the south part of the mound. The second layer of clay was of small extent, the greatest diameter measuring 11 feet east and west. Time did not permit of the southern part of this mound being excavated this year, but it will in all probability be completed next season. The substructure under the north and west aspects of the mound was not important, but under the east side, adjoining Mound 74, it was composed of timber and brushwood placed in an east-south-east and west-north-west direction.

Mound 74.—This was the largest mound in the north-west portion of the village, situated south-east of Mound 71, north-east of Mound 73 and north-west of Mound 75. It was composed of five floors, the greatest diameter being 34 feet east and west, and the greatest depth of clay near the centre of the mound 4 feet 2 inches. The floors throughout the mound were uniformly composed of yellow clay. Floors I. and II. were the largest in extent, measuring 32 feet in diameter east and west. Floors III. and IV. averaged 25 feet east and west. Floor V. measured 11 feet east and west. The hearth belonging to Floor I. was composed of an oval area of gravel measuring 2.9 by 2.3 feet, and placed excentrically to the south-south-west of the central picket, or highest part of the mound. Floor II. had two superimposed hearths; the upper, a raised area of red clay measuring 3 feet 3 inches in diameter, of a deep convex outline in section, with thirty small sandstone pebbles embedded in the centre and arranged over a space 2 feet 3 inches in diameter. The diameter of the hearth through the base was 6 feet. The lower hearth was made of grey clay. Floor III. had two superimposed hearths; the upper, a small area of blue clay with an unusually distinct bevelled edge; the lower, an area of baked clay with irregular surface. Floor IV. had a remarkable series of four hearths. The first was made of gravel with a well-defined bevelled edge of circular outline, with a diameter of 3 feet 6 inches. The second made of grey clay, circular in outline, surface flat, and tilted towards the east. The third made of gravel, resting on a substratum of grey clay; the surface of the hearth was flat, the outline quadrangular, with the corners rounded off and the margin finely bevelled. The fourth made of clay; the surface was hard-baked and uneven, the greatest depression 3 inches deep; the hearth had a circular outline, surrounded by a moulded rim 6 inches

wide at the base and raised $1\frac{1}{2}$ inch above the level of the enclosed baked clay area, which measured 3 feet 3 inches in diameter. Floor V. was a small area of clay which only partially covered the timber substructure. It had two superimposed hearths of baked clay arranged eccentrically west of the central picket, or highest point of the mound.

The timber substructure was remarkably complete and well preserved. The timber formed a circular platform 19 feet in diameter east and west, the pieces being placed lengthways in an east-north-east and west-south-west direction, and measured from 6 to 12 feet long and from 5 to 9 inches in diameter. These were resting on other logs placed at right angles. The platform sank towards the centre, forming a shallow, saucer-shaped concavity, the difference in the level of the circumference and the centre of the depression being 15 inches. The platform was surrounded by several concentric rings of small piles or wall-posts. The posts were driven in at intervals of 9 to 15 inches. The inner circle of posts was placed at an average distance of 9 feet 6 inches from the centre, the second at 10 feet 6 inches and the third at 12 feet. Besides the piles arranged in line, several hundred more were found driven in indiscriminately, without apparent arrangement, within a distance of 12 to 16 feet from the centre of the dwelling. At the west-south-west aspect of the platform the continuity in the lines of the wall-posts was broken for a space of 6 feet. Where the concentric circles of wall-posts terminated two lines of three large piles were found, radiating from the centre to the circumference of the dwelling. The piles in each line were placed at 12 inches apart, and the middle post in each instance formed the terminal post of the inner circle of wall-posts. Between the two lines of posts the arrangement of timber differed completely from other parts of the substructure, and distinctly marked the entrance to the dwelling. Immediately outside the timber threshold was a large slab of lias, in the position we should have expected to find an entrance pavement. On either side of the entrance the timber of the platform was arranged triangularly; the base of the triangle, roughly measuring 5 feet, faced towards the circumference, and the apex towards the centre of the dwelling. The pieces of timber were placed parallel with the line of wall-posts, and gradually diminished in length towards the apex.

Mound 75.—The north-west quarter of this dwelling-mound was partly explored, and found to be composed of four floors. The mound awaits further examination next season.

Mound 76.—This dwelling-mound was situated near the west border of the village, and was protected along the south-west and west aspects by the border-palisading. It was placed south-east of Mound 72 and south-west of Mound 73, being continuous with the floors of both the adjacent mounds. The mound was composed of three floors, the greatest diameter east and west being 32 feet. The greatest depth of clay near the centre of the dwelling was 2 feet.

Floor I.—The hearth was incomplete, being within a few inches of the surface of the field. It was composed of a circular area of red marl 3 feet 6 inches in diameter. **Floor II.**—The hearth belonging to this floor was made of a raised area of clay 3 feet 3 inches in diameter, with thin slabs of lias embedded at the centre. The diameter of the stonework measured 2 feet. **Floor III.** was made of a mixture of grey marl, yellow clay and fireash, having quite a different appearance from the floors above made of yellow clay. The hearths belonging to this floor were composed of grey marl, and arranged in three superimposed layers. The centre of the upper hearth was hollowed out in the shape of a shallow basin with irregular outline, the depression in section being bordered by a raised moulded rim averaging 7 inches in width across the base and 2½ inches in depth. The depression was filled with fireash and several fragments of slag. Pieces of slag were also found on the floor around, together with portions of two crucibles and fragments of bronze and iron.

The substructure was strong and well preserved along the south-west and west aspects of the mound, the timber being chiefly arranged in a north by north-west and south by south-east direction, with occasional planks placed at right angles. Under other parts of the mound the woodwork was of less importance.

Mound 83.—This dwelling-mound covered a large area, measuring 28 feet east and west. It was situated near the north-west corner of the village, lying south-west of Mound 67, east of Mound 61 and south of Mound 68. It

was composed of four floors, the margins of which were considerably overlapped by the three adjacent mounds. Floors I, II. and III. were made of pale yellowish-grey clay; Floor IV. of yellow clay, in which quantities of hard orange-coloured ochreous nodules and gravel were uniformly mixed. The greatest thickness of clay at the centre of the mound measured 3 feet 6 inches.

Floor I. was a thin layer of clay with an average thickness of 6 inches; there were distinct traces of a baked-clay hearth extending over a circular area 5 feet in diameter.

Floor II. was 8 inches thick at its greatest depth and near the centre there were indications of a baked-clay hearth.

Floor III.—The clay averaged 6 inches thick; the hearth was made of baked clay and measured 2 feet 11 inches east and west across the top.

Floor IV.—The clay of this floor was 1 foot 10 inches thick at its greatest depth. The hearth was a circular area of baked clay, having a well-preserved and finely-moulded bevelled edge averaging 2 inches in depth. The average diameter across the top was 3 feet 7½ inches; the centre was raised 2 inches above the periphery of the edge and from 3 to 5 inches above the marginal line of the base.

The substructure was not strong or well arranged. Lying parallel with the east margin of Floor IV. a large mortised oak beam with three perforations was unearthed, measuring 8 feet long and 15 inches wide; it did not appear to be in its original position. Along the north-east margin of the mound a line of hurdlework was found, lying in a north-north-west and south-south-east direction. An alder-tree stump with roots *in situ* was found in the peat under the north-west quarter of the mound.

Among the objects found were a small piece of baked clay with three arms, perhaps a toy, a small fibula with spring of coiled wire, a solid bronze link-shaped object, a harness ornament, a spiral finger-ring, an unusually long weaving-comb, a large armet, ornamental pottery, upper and lower stones of a quern, red colouring matter, a wooden mallet, portion of hub of a wheel, &c.

EXCAVATIONS ON ROMAN SITES IN BRITAIN.

THE report of the committee, consisting of Professor W. Boyd Dawkins (chairman), Mr. J. L. Myres (secretary), Sir Edward Brabrook, Professor W. Ridgeway and Mr. T. Ashby, appointed to co-operate with local committees in excavations on Roman sites in Britain, was presented at the meeting of the British Association.

The committee has made itself acquainted, as in former years, with the course of the excavations which have been in progress on Roman sites in Britain during the past year, and has been favoured in certain cases with summary reports of the work done. After full discussion of the circumstances thus brought to its notice, the committee has decided to offer grants in aid of special researches on certain sites as follows:—

At Caerwent, as in 1904 and 1905, for the following special objects:—(a) To examine the contents of wells found in the course of excavation, with special reference to the stratification of their contents, and to the identification of the remains of animals and plants which may be found therein. (b) To determine the age and construction of the mound and ditch by cutting a complete section, or otherwise.

At Melandra Castle, for special investigation of non-Roman and pre-Roman remains. At Newstead, near Melrose, for special investigation of the contents of wells, in the same manner as at Caerwent.

In the case of Silchester, to which the committee made a small grant in 1904, no formal report has been received, but the contents of wells found in the course of the excavation have been examined as before. The report from Silchester, which is appended, merely records the general progress of the excavation, in continuation of the series of summaries communicated to the British Association in years in which grants of money have been made.

Excavations at Caerwent, 1904-5.

(a) *Report upon the Investigation of the Mound.*—Upon the south, west and north sides of the city traces have been found, within the city wall, of an earlier defence, in the form of a mound of very hard red clay—the local clay, but more compact and binding than this clay in its natural state; it can be recognised by its hardness when excavated,

though there is but little difference in colour, and, further, by the existence on its surface of small pieces of charred twigs, which occur in less amount all through it. Just below it, too, there is also a layer of charred stuff—as if the brushwood on the site had first been set on fire, and as if that which grew on the top of the mound had also been burnt once or more.

After the necessary profile measurements had been taken, the mound was cut into in several places. The first section to be described was that to the S. of Room of "House XII." The material was here, as elsewhere, very hard red clay, with pebbles in it; 13 feet below grass level, at 10 feet from the wall of the courtyard (which interrupts its backward slope), a pocket of charred stuff and burnt bones was found, with some pottery, including figured *terra sigillata*, and the bottom of one *terra sigillata* vase, with inscription, OF. APRO (C.I.L. vii. 1336. 78). Under the mound itself one small piece of bronze, one bit of *terra sigillata*, one bit of pottery with rough black paste and some grey pottery were found.

Another partial section was made a little further west, to the south of Room 15 of "House XII." Here the crest of the mound was found to have been 5 feet only below ground. The hard clay layer was only 4 feet 7 inches thick at the crest and 3 feet on each side; it consisted mostly of dark clay, with a lighter layer between. Under it were found several bones and a flake of flint, also a bone pin and several pieces of pottery. The earth below it is gravelly, with chips of limestone in it. Below this again comes natural hard red clay. Immediately to the west of the south gate the mound was found to slope away in all directions, showing clearly that there was a break in it to let the road out. A good photograph of this portion was obtained. To the east of the south gate it was not found at first,* but eventually a limekiln was found cutting into the mound, which was perhaps used by the builders of the wall.

A similar section on the west side of the city, west of "House VII.," a little way south of the west gate, is published in the Caerwent Excavation Committee's Report for 1901.† Here there was a road at the bottom of the backward slope of the mound, on the further edge of which was the west wall of the house. When the wall was constructed the house was extended over part of the road and the level slightly raised, inasmuch as the space between the mound and the city wall was naturally filled up.

On the west side of the city the mound has been traced, and its profile ascertained a little way east of the north gate.‡ It is intended to make investigations at other points further east.

Two sections have so far been taken of the city ditch, one just outside the north gate, the other some way further east,§ but it has not yet been ascertained whether the ditch originally belonged to the mound, the wall having thus been constructed on a shelf cut in the mound, and using the same ditch. This can probably be found out at the point indicated to the north of the amphitheatre, and it would be in this work, in taking another section of the city ditch and in working any wells that may come to light, that the balance of the British Association's grant for last year and the grant for the present year would be expended.

(b) *Sundry Animal Remains found at Caerwent, 1904.*—The following animal remains have been identified in the course of the excavations:—

(1) From a pot found upright in "House XII.," Room 39: Shrew, "Sorex vulgaris;" bird (egg-shell); toad, "Bufo vulgaris;" molluscs, "Helix pomatia" (fragment), "Helix aspersa," "Helix rotundata," "Helix pulchella," "Cochlicopa lubrica," "Limax agrestis" (?).

(2) From a drain by the side of the wall on south side of south gate (later extension of XIII.), 10 feet 4 inches below grass: Pig, "Sus scrofa;" teal, "Querquedula crecca" (?); fowl (?); fish-bone; iron nail.

(3) From "House XII.," Room 20, 6 feet down: "Achatina acicula" and "Microtus sp."

(4) From the westernmost of two V-shaped drains between "Houses XI. and XII.," 5 feet down: Much Roman pottery; "Mus sylvaticus" (?); Dunlin, "Tringa alpina" (beak); teal.

(c) *Report on Wells and their Contents, 1905.*—Well A

lies E. of "House VI." N. (see "Caerw. Comm. Rep.," 1901-3, p. 26); it is 25 feet 6 inches deep; its width varies: at mouth, 2 feet 3 inches by 2 feet 5 inches; at 18 feet down, 2 feet 9 inches by 3 feet; at 21½ feet down, 2 feet 8 inches by 3 feet; and at the bottom 2 feet 3 inches by 2 feet 5 inches, as at the mouth. The masonry is good throughout; the bottom is sandy rock. There is a spring at 18 feet, and here one stone is displaced. This well had already been cleared to 18 feet in 1903.

On clearing from 18 feet to 22 feet the finds were as follows:—Skulls of cows and other bones of cows and sheep (all cows were poleaxed), part of the skull of a dog and three fragments of stag-horn. From 22 feet to the bottom the finds were—more fragments of stag-horn, more skulls of cows ("B. longifrons"), oyster-shells, a scallop-shell, fragments of wood and hoops from buckets, small twigs, an acorn, fragments of human skull (23½ feet to 24½ feet down), much Roman pottery of ordinary types, and many old shoes (not of the open-work type) with hob-nails on the soles.*

Well B lies W. of "House XIII." N. It is 19½ feet deep; its width varies: at mouth, 2 feet 6 inches; at 15 feet down, 3 feet by 3 feet 3 inches; at bottom, 2 feet 4 inches by 2 feet 8 inches. The masonry is good, but the last 2 feet have no masonry, the sides being of clay. The bottom is of hard gravel.

The contents were as follows:—(a) From 4½ feet to 10½ feet: cow-bones, a fragment of wall-plaster, much concrete and a little ordinary Roman pottery; (b) from 10½ feet to the bottom, cow-bones, and (at 12 feet) sheep-bones, a few oyster-shells, fragments of ordinary pottery and roof-tiles, and a few fragments of shoe-leather.

Samples of earth from both wells have been sent to Mr. Lyell for examination for seeds.

(d) *Report on the Plant Remains for 1904.*—Mr. Clement Reid, who has kindly examined the samples of earth submitted to him, reports generally as follows †:—"Wheat is abundant mixed with tares. We find also the celery. A single badly-preserved seed of parsnip may belong to the same peculiar variety which occurs at Silchester. The remaining plants are weeds, such as elder, dock and stinging-nettle, with traces of willow and cottongrass, suggesting wetter places. No cultivated fruits have yet been found, the only edible species being the blackberry."

Excavations on the Site of the Roman Fort known as Melandra Castle, Derbyshire, 1905.

The excavations carried out at Melandra during 1905 have had as their main results:—(1) The uncovering of the foundations of the northern and southern gateways. (2) The uncovering of the greater part of the stone rampart surrounding the fort. (3) (As one result of the above) The determination of the exact dimensions of the fort. (4) A more careful examination of the rampart.

As the outcome of the work done:—(a) Measured plans have been obtained of all the gateways except one (which is more injured than the others). (b) A measured plan of the whole fort (including all the stone buildings discovered) has been drawn. (c) The pottery discovered on the site has been examined in detail with great care, and its bearing on the date of occupation of the camp fully brought out.

The following results of the year's work have a special bearing on the question of the occupation of the district in pre-Roman times:—

(a) In the course of the excavations, in addition to a number of Roman mill-stones, there were discovered within the area of the Roman fort a number of the earlier (beehive-shaped) querns. At least three patterns of these have been identified by Professor Boyd Dawkins, both upper and nether stones being present.

(b) An examination of the ancient roads in the immediate vicinity (by Professor Boyd Dawkins) led to the conclusion that prehistoric routes leading along Ridgeways in the direction of at least two prehistoric sites had been superseded by point-to-point Roman roads taking an easier gradient.

(c) An examination (by Professor Conway) of the set of leaden weights discovered on the site has led to a distinct confirmation of the theory (already laid down by Mr. Thomas May) that a number of these weights conform to a

* The excavations here were, owing to the presence of a walnut-tree (since removed), carried on under difficulties.

† *Archæologia*, vol. lviii. pl. ix.

‡ See *Caerw. Comm. Report* for 1901-3. *Archæologia*, vol. lix.

§ See *Caerw. Comm. Report* for 1901-3.

* The mud from the last 4 feet of the well was very difficult to examine carefully when it was actually excavated; but after it had dried, when it was used for filling in, in July of the present year (1906), five coins were found.

† The list is singularly like that of Silchester.

Celtic standard, while others are without doubt multiples of Roman units.

(d) A quantity of slag—showing the working of iron—has been found on the site. While this may not be pre-Roman, it is at least similar to what has been found on a number of prehistoric sites.

(e) A number of blunt chips and splinters, similar to those found near Rochdale and elsewhere in the Pennine Chain on Neolithic and Bronze Age sites, proves that the site was occupied in one or other or in both those ages.

Full and detailed reports of the work are contained in the volume entitled "*Melandra Castle*," published in June 1906 by the Manchester University Press.

Excavations at Newstead, near Melrose, 1905-6.

So far no remains of native pre-Roman civilisation have been found which require separate investigation, but there have been considerable opportunities for the examination of animal and plant remains. The animal remains, including a very large number of horse-bones, are being examined by Professor Ewart, of Edinburgh, and by Dr. Bryce, of Glasgow. Specimens of the plant remains have been sent to the Professor of Botany at Edinburgh, and it is to further investigation of similar plant remains that the grant now made is to be applied.

Excavations at Silchester, 1905.

No detailed report has as yet been received from the excavators as to the results obtained from the expenditure of the British Association's grant of 10*l.*, which was made in 1904 for work on the contents of wells and for trial trenches to ascertain the relation of the town well to the rectangular street plan. But the general character of the season's work at Silchester may be gathered from the summary which follows.

The excavations of 1905 extended over the six months from May 22 to November 18, under the constant supervision and direction of Mr. Mill Stephenson.

It was proposed to complete the investigation, which was begun so long ago as 1892, of the portions of Insulae V. and VI., and of the unnumbered insula south of them, which underlie the grass field. So far as Insulae V. and VI. are concerned, this investigation has been completed, but owing to the unexpected depth of soil which was found overlying the buildings in Insula VI. time did not allow of the ground to the south being even trenched. The excavation of the two insulae brought to light quite a number of interesting buildings.

In Insula V. the north-west corner was filled by a structure of regular plan but uncertain use, the main feature of which was a large pillared hall or workshop, with store-rooms at the end and a corridor or portico in front. In late times the building seems to have been degraded to other purposes. South of, but detached from it, was another structure of similar plan. The chambers behind this, however, were apparently living-rooms, and give a more domestic character to the building. From this second building there extends southwards a somewhat puzzling series of chambers of several dates as far as a large edifice that occupied the south-west corner of the insula. The main features of this were a great hall (?) with long and short corridors facing the streets, and a narrower corridor at the further end, beyond which again was a square building subdivided into small rooms. The nature and object of this extensive group of buildings is under investigation. The rest of the insula was devoid of buildings except along the northern margin, where there were laid open the foundations of a nice little house of the corridor type, with some interesting remains of mosaic pavements.

The western margin of Insula VI. is mostly occupied by the major part of an L-shaped building at the north-west corner which was examined in 1892. This has now been fully traced, and proved to consist of, apparently, a series of shops covered by a corridor or colonnade along the street fronts. At the south end there has been subsequently built on a second row of chambers, apparently as a series of drying-rooms, though the hypocausts have been destroyed. The northern wing of the block is noteworthy for having been built over an extensive layer of jaw-bones of oxen.

The remainder of the north side of the insula is almost entirely filled with the foundations of a large mansion of somewhat interesting character. It originally consisted of a fair-sized corridor house, standing north and south, with mosaic floors. To the east of this was afterwards added a courtyard enclosed by corridors, beyond which was built a second house on a somewhat larger scale, with fine mosaic pavements, &c. A room at the south-east angle is remark-

able for the remains of a wooden steeping tank sunk in the floor. In a corridor of one of the main chambers a human skeleton was found, laid in a rudely made grave against the wall. To the east of the house just described was a narrow courtyard with a wide entrance gateway on the north, and shut off from the street on the east by a strong wall.

On the southern margin of the insula are the remains of another interesting house, L-shaped in plan, and forming another example of the transition from the corridor to the courtyard type. Most of its floors were of plain or patterned mosaic. Under part of this house is a wood-lined well, associated with which were a number of pieces of sawn and cut timber of various sizes and uncertain use. Another large wood-lined well was found west of the building, and a third to the north-east. From this last there led southward, apparently to carry off the overflow of the well, a carefully constructed wooden conduit made of unusually fine oaken boards; two of them were no less than 25 feet long and 3 inches thick.

Owing to the nearness of the water to the surface, comparatively few pits and wells were met with, but the contents of these have nevertheless yielded further interesting remains of plants, &c., to the patient investigations of Mr. A. H. Lyell, Mr. Clement Reid and Professor Newton.

Several important architectural remains were brought to light, including some pieces of turned pillars, an unfinished "winged" altar, and a figure of a dormant lion, probably from the gable of some building.

A detailed account of all the discoveries was laid before the Society of Antiquaries on May 31, and will be duly published in "*Archæologia*."

A special exhibition of the antiquities, &c., found was also held, as in former years, at Burlington House.

It is proposed during the current year to continue, and, if possible, complete the investigation of the grass field, other parts of which have already been dealt with in 1902 and 1904. There will then remain only one other season's work to finish the examination of the whole of the 100 acres within the town wall.

No special report has yet been received from the excavators as to the results obtained by the expenditure of the British Association's grant.

PROTECTION OF ANCIENT MONUMENTS.

THE following letter has been forwarded to the Prime Minister by Mr. Ralph Nevill, F.S.A., hon. secretary of the Congress of Archæological Societies:—"By direction of the Congress of Archæological Societies in union with the Society of Antiquaries of London, I have the honour to send you the following resolution unanimously passed at their meeting held on July 4, 1906, under the presidency of Lord Avebury:—"That this Congress regrets that the Government has not carried out the provisions of the Ancient Monuments Protection Act for the appointment of an inspector. Various monuments have been placed under the Act on the faith that the provisions of the Bill would be observed; the Congress, therefore, urges that an inspector of ancient monuments should be appointed in accordance with the Act." I have been requested to say further that the Congress quite recognises the desire of the Government, in the arrangements that have been made, to protect the ancient monuments that have already been handed over to the care of the nation, and it has no intention of questioning either the zeal or ability of the official entrusted with the duties. I am instructed, however, to point out that it was intended by the Bill that the inspector should be a man of independent position, able to devote much attention to the duties of the office, and that these were intended to include, not merely the care of such monuments as were named in the Act, but an official status which would enable him to intervene for the preservation from destruction of other similar monuments. The experience of the committee of the Congress formed for recording earthworks shows that such an inspector might be of the greatest service in preserving from destruction those important relics of the past. It is obvious that duties of this description cannot be adequately discharged by an official in Government employ who has other important duties to fulfil and who does not possess the status contemplated in the Act. A salary is provided by the Act for the office of inspector, and I am to submit that this sum which is annually voted by Parliament should not be diverted by repayment to the Treasury as has been done for some years. The Congress wishes to call your

attention to the statement made by the First Commissioner of Works (Hansard, August 3, 1900):—"It has been thought advisable not to make any appointment immediately, so that some indication may first be gathered of the probable effect of this year's resolution for the extension of the Ancient Monuments Protection Act." On behalf of the Congress, which represents forty of the principal archaeological societies in England, Ireland and Wales, and some 12,000 members, I am to respectfully pray that you will see fit to revert to the original practice of appointing an independent inspector."

EXCAVATIONS AT CAERWENT.

THE present excavations at Caerwent, Monmouthshire, began in 1899, and have been carried on every summer since then for a period of about three months. The results obtained up to August, 1904, were described in a paper read at the Cambridge meeting. The rest of the season of 1904 was devoted to the exploration of a very large house on the west edge of the road leading to the south gate, in which three or four different periods of construction could be distinguished. An interesting mosaic pavement was discovered here, which has been removed to the Newport Museum. The house has been filled in again, but a full account has been published in "Archæologia," lix. 2.

The beginning of the season of 1905 was devoted to clearing the inner side of the south gate, which was found to have been filled in the same way as the north gate, but with greater care; the inner arch is to a considerable extent still preserved. The rest of the time was spent in work in the northern half of the city. Five buildings were excavated, one of which, containing an octagonal bath, is probably part of a building situated further north, which may be the public baths of the city. Of the others, one is remarkable for possessing a colonnade, another for having one of its walls preserved to a height of over 10 feet, the lower part retaining considerable remains of painted plaster. Two wells were excavated and yielded a considerable quantity of plant remains. The president of the fund, Lord Tredegar, has generously acquired, for purposes of excavation, a considerable area in the north-east portion of the city, and the campaign of 1906 will probably be devoted to the further examination of several buildings of which portions only have up till now been accessible.

GENERAL.

His Majesty King Edward VII. has ordered forty copies to be made of Sir Luke Fildes's portrait of Queen Alexandra, which was exhibited in the Academy. He considers it the best likeness of Her Majesty in existence, and he intends to present one to each of the Colonial Parliaments and to the British Embassies abroad.

Mr. John Lavery, R.S.A., has been elected Associate of the Royal Hibernian Academy, and the election has since received the approval of His Excellency the Lord-Lieutenant.

The Northamptonshire Education Committee have agreed that the appointment of Mr. A. F. Watson, as consulting architect at a salary of 100*l.* per annum, the appointment to be terminable by three months' notice in writing, and to be subject to the conditions laid down in the minute of appointment of September 30, 1905, be continued.

The Salisbury and District isolation hospital committee have agreed that architects be invited by advertisement to send in plans for the proposed, new hospital and that premiums of 20 guineas and 10 guineas be offered to the first and second in order of merit. The amount of the first premium to be merged in the ordinary commission should the architect be employed for the work.

The Duke of Devonshire, as well as his tenant, will allow excavations to be undertaken in the outer court of Pevensey Castle. The work will be under the direction of a committee of the experts formed by the staff of the Victoria Histories, acting in co-operation with the Sussex Archaeological Society, and there is every reason to hope that the results will prove of great interest and value, as it seems probable that the remains of the Roman settlement of the Anderida, which was sacked by the Saxons in 491, have not been disturbed during the last 1,400 years.

Mr. Robert Henry Middleton, borough surveyor of Walsall, with which town he had been connected in an official capacity for a period of about twenty years, died on the 4th inst.

Mr. F. W. Oxberry has been selected out of the 216 candidates for the position of borough engineer to the Kendal Town Council. Mr. Oxberry will therefore resign his post of assistant engineer at York.

Messrs. D. H. Burnham & Co., architects, Chicago, are said to be about to enter the European field. Mr. E. R. Graham of the firm has left Chicago for London, where, it is said, he will draw preliminary plans for a great mercantile structure.

At Caerphilly, near Cardiff, a bronze tablet has been erected to the memory of William Edwards, a bridge builder towards the close of the eighteenth century. Edwards was for forty years pastor of the chapel where the tablet was unveiled. During that time he erected several bridges in South Wales.

A Memorial Cross has been unveiled on the site of Douglas Old Chapel, in Parbold, near Wigan, which was demolished thirty years ago. This was the oldest ecclesiastical edifice in the county, having been built according to tradition to commemorate a victory of the Saxons over the Danes.

Mr. James Thomson, the interim Dundee burgh engineer, has been appointed burgh engineer at a salary of 500*l.* per annum, after having worked for the Council during thirty-three years. The terms of the appointment are that the salary proposed to be given shall cover all duties undertaken by Mr. Thomson, including those attaching to the office of city architect, which he has for some time held, Parliamentary work, &c.

Mr. W. Hale, R.S.A., has completed another panel in the banqueting-hall of the new City Chambers, Edinburgh. The subject is King Robert the Bruce granting at Cardross a charter to Edinburgh in 1329.

Mr. Lloyd Edward, county surveyor for Glamorganshire, died at Bridgend on Tuesday at the age of sixty-three.

Mr. Burns, M.P., was asked in the House of Commons on the 4th inst. whether his attention had been called to a statement of Sir Alexander Binnie that the rivers Thames and Lee, from which the drinking water of London is drawn, receive above the waterworks intakes the more or less clarified sewage of 1,000,000 persons in the case of the Thames and about 250,000 in the case of the Lee, and that the late Sir George Buchanan, principal medical officer of the Local Government Board, stated that the drinking of such contaminated water ultimately results in death and disease to the consumers; and whether it was proposed to take any steps to secure a purer water supply for London. The President of the Local Government Board replied:—"I have seen the statement made by Sir Alexander Binnie. I am informed that the whole question of the adequacy of the works of the Water Board and existing sources to deal with the present and future population of the water area is now under the consideration of a committee of that Board."

Sir Henry Campbell-Bannerman having been asked whether, in view of the fact that over 150,000,000*l.* has now been deposited by the working classes in the Post Office Savings Bank, he could see his way to introduce legislation to enable a proportion of the sum, say one-third, to be devoted to the erection of model freehold dwelling-houses for the working-classes, thus helping the poor with their own capital, said he was not prepared to introduce legislation for this purpose. He did not think that working-class dwellings are the most appropriate form of security in which to invest Savings Bank deposits. But a considerable portion of the Savings Bank funds is already applied, through the Local Loans Fund, in providing advances to local authorities for their expenditure on housing and other purposes.

Birse Castle, Aberdeenshire, which formerly belonged to the Marquis of Huntly, has been restored under the direction of Mr. G. B. Mitchell, architect, Aberdeen.

Mr. Walter Emden, J.P., the well-known West-end architect, who has now retired from business, has presented his business to his four principal assistants, namely, Mr. S. H. Egan, Mr. W. S. Emden, Mr. A. J. Croughton and Mr. T. C. Ovenston, who will now carry on the practice at the same address under the style of Messrs. Emden, Egan & Co. We inserted a paragraph on July 27 which would give an incorrect impression, as through an oversight the name of Mr. S. H. Egan was alone mentioned, whereas the practice has been presented to the four gentlemen referred to.

The Architect.

THE WEEK.

THERE has been silence about the measures to be taken for the preservation or removal of the Auld Brig at Ayr since January, and it would be pardonable if people in the South concluded that arrangements were made which were favourable to the preservation of the structure. A sum of 10,000*l.* was required to carry out the works necessary if the bridge could be utilised for public traffic while still retaining its present character. The Town Council agreed to delay their decision until August 1. At a meeting on Monday Mr. OSWALD, who has been endeavouring to raise the money, was compelled to inform the Provost that he had only received promises amounting to 4,000*l.* He considers, however, that inasmuch as so much money was raised through the efforts of one individual, the public will come to the rescue of the bridge by subscribing the remainder of the money. Meanwhile, he appealed for a further delay of two months, which the Town Council of Ayr have agreed to allow. There is consequently some hope for preserving an interesting structure.

It is announced that students matriculating in September at the University of London can enter on the courses for architectural students in October. There are two courses—the degree course of three years and the certificate course of two years. The degree course has been established in order to provide architectural students with an opportunity to continue their general studies while commencing their professional work. University College has the advantage of possessing a large engineering laboratory, the Slade School of Art, and comprehensive courses of arts and science. Arrangements have been made with the Carpenters' Company for a series of demonstrations in each year in the practical working of materials at the Trades Technical School, Great Titchfield Street. These are supplementary to the lectures and classes on building construction at the College. In addition visits are paid to workshops and to buildings in course of erection. There is a course by the professor of mechanical engineering on steel and iron construction and the testing of materials. There are, besides, for the convenience of some students evening classes in design, construction, measuring and quantities. Professor F. M. SIMPSON directs the day and evening classes, and he has the advantage of skilled assistants. The prospectus is deserving of the attention of students.

MEN in Birmingham have been distinguished by shrewdness, and that that quality still prevails was shown by proceedings at a meeting of the Birmingham Trades Council on Saturday last. The following resolution was proposed:—"That this Council regrets that in the large number of contracts let of late by the various committees of the City Council no clause or proviso was inserted to prevent the ever-increasing importation of quarry-worked stone; also that the continual subletting and re-subletting of this branch of the building trade is, we believe, detrimental to the ratepayers and workmen concerned, and this Council do urge upon our city councillors the necessity, while such prevailing lack of employment continues, to restrict as much as possible this importation of quarry-worked stone in future contracts, believing that thereby great assistance will be rendered to the solution of the unemployed problem." The preparation of stones in a quarry is a subject which masons in towns may with reason be supposed to question. In the first place, machinery may be used to a larger extent than masons would consider as fair to themselves. The American masons have in one place organised

a strike as the only way to assert their grievances. The Birmingham Trades Council might therefore be excused if they treated the subject academically and voted on it as a simple subject of political economy. But thirty-five were opposed to the resolution as against twelve in its favour, or, we may say, three to one. One member said there was no use in trying to prevent work being done at any place where the expenses were the most economical. Another speaker asserted that cheapness was not alone to be considered, but quality of work. At the quarry it was known how the stone was bedded, and men on the spot were therefore better able to dress it than those living at a distance. It was also pointed out that the resolution was suggestive of selfishness, for according to it the interest of the Birmingham stonemasons was alone deserving of consideration.

ST. BOTOLPH'S Church in Boston has so fine a tower that the other parts of the building become rather diminished in interest. The building was commenced in 1309, and it is one of the best examples of its class in the country. In 1857 it was restored, mainly by donations from Boston in the United States, whose people claimed an interest in the church. As a property it is somewhat peculiar, for the Corporation are the lay impropiators, having purchased the tithes in the sixteenth century. We suppose it was expected that New England would again intervene, for the chancel roof has been allowed to fall into so bad a state that a gale of wind or heavy snow might drive it in and a serious catastrophe ensue. The borough engineer, Mr. G. A. CLARKE, has called in Mr. W. S. WEATHERLEY, architect, and they have prepared a report on the decay which no doubt has long been apparent to worshippers. According to Mr. WEATHERLEY, the time has passed for repairs and the roof must be reconstructed. Mr. CLARKE estimates that the cost will be about 1,000*l.*

THERE is not as yet any street in Paris which bears the name of the late M. ALPHAND, although there is a public memorial of him. One reason for the omission is the circumstance that he was the chief lieutenant of Baron HAUSSMANN. But after the passing of the Empire he rendered services to the Municipal Council of Paris which should be remembered. An opportunity to make amends will soon be presented. The final arrangements have been sanctioned for the continuation of the Boulevard Raspail to the Rue de Sèvres, which will make a direct thoroughfare from the Boulevard Saint-Germain to the crossway where the Lion de Belfort is placed, thus connecting the Champs-Élysées with the less-known Parc de Montsouris. The line was originally projected by M. ALPHAND, and it would be equitable if when completed it bore his name.

COMMEMORATIONS are now in favour, and therefore it is allowable for the Liverpool Corporation to consider the possibility of celebrating the 700th anniversary of their charter next year. That precious document is still in existence. It was signed at Winchester on August 28, 1207, and is inscribed "King JOHN's Charter of Liberty and Protection for the Burgagors of Liverpool." Professor RAMSAY MUIR, of the local university, some time ago prepared a scheme with the assistance of the Town Clerk. One essential feature would be an imitation of the port and town as it existed seven centuries ago. There was also an ancient castle which might be reconstructed and used for an exhibition of historic documents and pictures. Views exist also of the old tower which stood in Water Street. So long a period as seven centuries affords numerous incidents which might serve as subjects for pageants. Indeed, if the architects and archæologists of Liverpool can be induced to co-operate in the project it would be possible to have spectacles which would surpass all others of that character seen during late years in England.

THE KHAN.

IN a paper which was read by Professor W. M. RAMSAY before the British Association on "Past and Present in Asia Minor," the advantages which were likely to arise from the construction of the Bagdad Railway were anticipated. Although at one time the connection between commerce and civilisation was not accepted, and the dependence of commerce on good roads over which people could travel in safety, few theorists and fewer practical men would nowadays doubt those facts. We may therefore agree with the Professor when he says:—"The chief cause of the destruction of the ancient industries of Asia Minor was the difficulty of communication over the country. While the cities at first retained their old standard of civilisation, they were divided from each other by the sea of barbarism and nomadism. In earlier Turkish time trade passed with difficulty from city to city by aid of the large and splendid khans, which the Seljuk sultans built at intervals along the chief roads. These khans, though often very beautiful as buildings, were not a proof of civilisation, but of the submergence of civilisation. They were fortresses in which caravans might rest safe from the nomads at night; tiny islets in the sea of nomadism."

It is easy for political economists and statisticians to become imaginative when they are dealing with the future. The khans or caravanseries, which we may call refuges, or havens of rest, in one of the most disturbed parts of the world, are not likely to be entirely superseded by railways for some centuries at least. If we believe such histories as have come down to us, khans were introduced in Persia by CHOSROËS as early as the sixth century. Persia was then comparatively civilised. But the immense tracts which could not be cultivated with profit, and which therefore were uninhabited, gave facilities to land thieves of a more dangerous class than those imagined by SHYLOCK. The East is not so disposed to changes as the West, for it was only a couple of years ago that Lord CROMER announced he had to expend money on similar buildings for the protection of caravans. The departure of the Mahmal, or Sacred Carpet, to Mecca is a sight which is familiar to all of us who have lived for a time in Egypt. The pilgrims who accompany the symbol are entitled to some respect from Bedouins. But it is necessary to furnish an escort of the Egyptian army to safeguard them. Henceforth it is proposed to have from 200 to 400 men, including cavalry and artillery, with two Krupp guns and a Maxim. Previous to 1904 the average number of pilgrims from Egypt to Mecca was less than 6,000. With the guarantee of security which the presence of the troops offered the number at once rose to 10,000, and last year the total was 14,366. We must take the world as we find it, and it is evident that in the twentieth century khans for travellers and their escort are as necessary as when they were first set up.

The establishment of them must be credited mainly to sultans and other men who held high office. But there are enough traditions which testify that some of the grandest khans were due to individuals who held no offices. The necessity of protecting pilgrims made the erection of a khan appear as a religious duty. But as the trade guilds in London were occasionally endowed with valuable property for charitable use by ordinary members, it is also likely that some of the khans were erected by traders who had become acquainted through personal experience with the dangers of the routes. There are, no doubt, buildings called khans which correspond with ordinary inns or hotels. But the true caravanseries are open to all who care for temporary shelter in them, and the only expense entailed is a gratuity to the man in charge and which is not compulsory.

In arrangement they correspond, varying mainly in size. But there is a vast difference in the modes of construction. The beautiful ruined building of KAIT BEY,

in Cairo, which is familiar to all tourists, is not to be taken as an example of those which greet the eye in spite of their plainness after a day's journey through a desolate region. Some, indeed, appear at a distance to resemble the mud-built fortresses which are found in various parts of Egypt. Although the individual Arab may be hospitable to a stranger, especially when he possesses the magnetic force of a scarred swordsman like BURTON, yet when the same Arab is in partnership with some of his companions he is not above commonplace burglary. The outer enclosure of a khan is therefore usually made very thick with sun-dried bricks, and with only a few slits in the walls. In the days when nobody could dream of defence by Krupp and Maxim guns it was considered desirable to make the exterior appear as solid as a pyramid. FER-GUSSON says of the Persian khans:—"Externally they present only a high plain wall, surmounted by battlements and flanked by towers at each angle, and sometimes also by additional towers in the longer faces. The principal architectural ornament is lavished on the gateways, which are almost always higher than the contiguous walls, and often display great beauty of design combined with considerable elaboration of detail." FER-GUSSON must have been fortunate in either seeing or obtaining drawings of some peculiar example. As a rule there is only one gateway to a khan which is outside a town. It has to be sufficiently high to enable a tall camel to pass through it, but far greater care was usually bestowed on the means of barricading the doors than on ornamentation. A wealthy man might expend money on carving, but the ordinary official khans cannot be considered a decorated class of structures.

Generally speaking, beasts as well as men find shelter within the enclosure; but occasions arise when the camels have to remain outside. The khan might be considered as a small cattle market by a stranger, for the camels and mules are all in the centre, where there is usually a fountain, for water alone is supplied. There is an arcade around with arches which bear some resemblance to Western Gothic, and in the recesses the travellers and their goods remain. There is an upper storey where there are likewise a number of recesses. Here and there in some of the more expensive khans texts from the Koran are found carved on the walls. The travellers, if they are not too fatigued, collect in parties, and story-telling is a common manner of passing away the time.

Asia Minor has been for many years in too disturbed a state to allow of the expenditure of public money on the preservation of the buildings. Many are now in a ruinous state, and it is doubtful, however much he might desire to do so, whether Lord CROMER could bring the khans under the control of his archaeological department. There is nothing to prevent him taking care of the rude relics found in the Sudan. But the pilgrims and traders who take part in caravan journeys are a touchy lot and suspicious of kindness.

Although the khans are a necessity they are evidence of the misgovernment which afflicts so large a portion of western Asia. Indeed, it might be said that time and neglect will do more to cause their overthrow than any railways which are likely to be constructed during the present century at least. According to report Persia has set up a Parliament; and who knows but it may find patriots who will look after the preservation of the old khans without receiving any salary for their labour?

With all their defects the sultans and nobles who erected the khans were inspired by a better spirit than prevailed in Europe while feudal castles were erected. The latter were, no doubt, sometimes used for the defence of retainers, but for many years the castles served only as a shelter for those who lived by committing depredations on traders. At one time CHARLES LE CHAUVÉ issued an order that the castles in France should be demolished because the people in the localities suffered so much from the depredations of the owners, but the

nobles were too powerful and resisted his decrees. For a time the history of civilisation appears to be nothing more than a contest between traders and the owners of castles. Eventually freedom was secured, but it was only by the payment of immense sums and the loss of many human lives.

THE PERSONAL EQUATION IN ARCHITECTURE.

THE phrase "personal equation" first arose, we believe, from a comparison between the observations of ordinary eyes, and those made by eyes which were aided by elaborate instruments. The latter are, no doubt, likely to be more exact as they are more minute. But it is doubtful whether they offer equal interest when compared with the former. The astronomy of the Chaldean shepherds could be expressed by very simple mathematics, and it related only to a limited number of stars and phenomena. But it served the purposes of the watchers, and excited their wonder and admiration more than would be possible with returns from an observatory of the modern class.

Not only astronomy but most varieties of modern science require aids and appliances of a kind which was unattainable in an early age. It is not possible, for instance, to determine "the proportions in which isodynamic compounds are in equilibrium in solution," or "the state of solution of proteids," or the hundreds of modern puzzles in physics, without apparatus which men were incompetent to make during many centuries. In fact, the difference between science and the fine arts, including literature, may be said to consist in the absolute necessity of appliances, or, let us say, machinery, to help the human faculties for work in any of the sciences and the uselessness of such help in the arts. If, for instance, the world were endowed with a genuine epic-poet in our times he would set about his mission in the same simple way that HOMER did. If unable to write he could dictate. Chemistry, with all its marvellous progress, has not afforded much aid to painting, nor geology to sculpture. The modern studio does not differ from those of old in Athens or Florence. We have, no doubt, a great many artificial but valuable materials which can be used in building, and we can obtain marbles and other beautiful stones more readily than the ancients. Thanks to science, an ordinary building can now be more healthy and more comfortable than one built in Classic or Mediæval times.

But with all these improvements can it be supposed that the designs for an important building like the new offices for the London County Council will present any extraordinary features? We do not mean, of course, that there will be no novelties introduced for facilitating the transaction of business, for we know a great many devices are in the market which claim to achieve that end. We may expect to see in it the latest constructional, sanitary and illuminating improvements. It may be possible by the planning aided by machinery and varied apparatus to avoid the complaints which are every year heard in connection with BARRY'S building on the opposite side of the Thames. We may, in fact, expect to see an embodiment in the structure of all that science can produce for the service of the occupants.

While so much is certain, it would be interesting to know whether the assessors anticipate a pleasing task in the examination of the designs which all parts of the world are eligible to furnish. It is no easy work to glance at a large number of architectural drawings. But the toil is increased when it is found that the greater number of the designers have supposed there are only a very limited number of forms which can be employed. That is likely to be the case with the schemes for the County Council hall. After all the aspersions on the Houses of Parliament he would be a courageous man who would submit a design in Early or Late Gothic or the "Elizabethan" of the original

committee. St. Thomas's Hospital, which will inevitably form a pendant to the new building, must further circumscribe the efforts of those who would adopt one class of Italian; and the buildings on the other side of the Thames, to the east of Westminster Bridge, will also have restrictive power.

This mode of speculation may appear to be unworthy of the occasion. If a sculptural group were proposed, or a great painting as a memorial of the prowess of the London County Council, it would be absurd to limit the powers of the artist even in theory. But it is the misfortune of architecture that under the best of circumstances it can only now be exercised within a very narrow range. The personal equation of the painter or the sculptor can be unfettered. He need not trouble himself about prior examples. But the architect's personal power must be accompanied by a real or assumed reverence for a particular manner of treatment. He is not allowed equal liberty with the painters and sculptors. For the first question put to him recalls ANCIENT PISTOL'S "Under which king, Bezonian? Speak or die." He is supposed to have sworn fealty to a style which, for the time being, is sovereign to him, and to which he is expected to be loyal regardless of all sacrifices on his part. An architectural design is, in England at least, supposed to resemble the conveyance which has been drawn up for the site. Not only phrases but large parts must correspond with approved forms which have been repeated again and again, and which could be expressed at least as satisfactorily in a less stereotyped manner.

Is it too much to expect that, in a great international competition like that which is being arranged, some architect should be found to insist on his rights to design the London County Council hall with a freedom which would in some measure correspond with that allowed to the painter or the sculptor if they were called on to compete for some public memorial in London? Surely there are foreign architects who would display greater vigour of treatment than is to be seen in some of the recent public buildings in this country. It might easily be imagined that many of them were designed by women, from the peculiar femininity which characterises not only the details but the composition as a whole. That kind of treatment is often supposed to express refinement, but with more truth it might be considered as weakness. Efforts are occasionally made to compensate for thinness in one part of a building by an excessive massiveness in another part. But such a co-existence of extremes merely marks a nearer approach to feminine peculiarities. It is to be feared that habit in designing or the contemplation of works of the kind we have described will have an effect on the English projects at least. It is therefore desirable that some of the foreigners will be true to themselves and will not seek to curry favour by preparing designs in the English manner, in which unfortunate defects are sure to be magnified.

It is a misfortune in England that whenever a style is practised or is the temporary vogue, facility of production makes one variety gain the ascendancy. Among a collection of photographs of nineteenth-century churches BURGESS'S Cork Cathedral stands out with almost as much effect as if it were printed in relief. His was a personal equation which could not fail to assert itself. But his manner was difficult to imitate, and it was not satisfactory in the eyes of the weaklings who directed the disposal of commissions for church buildings. The consequence was that a treatment was adopted which seemed to exemplify the advantages of stone-working machinery, and was therefore adapted for a land in which factories abound.

Gothic was abandoned, and, indeed, owing to the way in which it was being manufactured in its later examples, there was not much of a loss. Old examples of other styles were subsequently experimented with, and experience has shown that there is really not much

difficulty in adapting Renaissance examples to the modern system of production. But under the circumstances it is not to be supposed that the personal equation will count for much in the adaptations. When one takes a number of elements, alters them slightly, and arranges them somewhat differently from the way they are found in some admired building, individuality of any kind becomes difficult to discover. Yet it is admitted, even at the present time, that what is most sought after in painting, sculpture and literature is something or other which will give us a clue to the mind of the beings that are known as authors or artists. Impressionism is only an exaggerated yet partial manner of expressing the personal equation. Few writers have been more often condemned of late than CHARLES DICKENS. His beings are said to be not faithful to life, his pathos and humour mere efforts to please the gallery, and so on. Yet it is recognised that all the shortcomings of his books have a personal character, and are suggestive of a man who was true to himself in all he did, and preferred his own resources to the canons of the rhetoricians. If we could only have an architectural DICKENS who would resist all temptations to adopt Pecksniffian ways he might be the means of causing a revolution that would lead to the production of works which would at least be suggestive of individual designers.

UNFAIR COMPETITION.

IN these days of world-wide businesses and international trade it is always satisfactory to find that the laws of two civilised States are absolutely identical. It is convenient to traders, and it gives a welcome testimony to the fundamental fairness of the law. Such a testimony, of particular interest to all who are concerned with specialised manufactures, we get upon reading in the *Journal des Tribunaux* of May 3, 1906, the report of the case of the E. C. Powder Co., Ltd., v. La Société Coopall et Cie of Wetteren, which was decided in Belgium in April last. The plaintiff company in this case are the inventors and manufacturers of the E. C. smokeless powder. Sportsmen all over the world know the excellence of this powder. They know, too, that its quality is maintained and is constantly being improved by reason of the fact that the managing director is recognised by all chemists and by the British Government to be one of the first authorities upon explosives in this country. That being so, E. C. powder is a well-known article of commerce.

The defendants mixed their powder with the E. C. powder, and sold the mixture as E. C. powder at a reduced price. The Court held the defendants liable to pay as damages to the plaintiffs the sum of 5,000 francs, authorised the plaintiffs to publish the judgment in ten Belgian papers at the expense of the defendants, and further authorised them to spend the whole or part of the damages in giving such further publicity to the judgment as they wished. The important point to note is that the reasons underlying the decision are identical with principles which have many times been laid down in the House of Lords. The Belgian Court laid it down as a principle that "a special sign which indicates the origin of certain products can become the object of an exclusive right; that is, a name or appellation, a distinctive mark, figures or initial notations, not guaranteed by any registration, but which may be equivalent in reality to the name of the producer, are protected by the ordinary principles of civil responsibility for the profit of whoever was the first to make the prior usage for commercial or public purposes." They found also that "the identity of appearance of the powders of plaintiffs and defendants, the use of labels for deceiving purchasers, the employment of the title 'E. C. 3,' which gave to the imitation the appearance of the renowned manufactory, the methods of abuse towards the original makers which were revealed in the course of the inquiries, justify all the charges of the

Powder Company and establish the unfair conduct of the Coopall Company." Now compare this with some of the opinions of the Law Lords in *REDDAWAY v. BANHAM*, the case in which the defendant tried to appropriate the name "camel hair" for his belting, though in the trade the term "camel-hair belting" was well known to be REDDAWAY'S. "The fundamental rule is," it was said, "that one man has no right to put off his goods for sale as the goods of a rival trader, and he cannot therefore be allowed to use names, marks, letters or other indicia by which he may induce purchasers to believe that the goods which he is selling are the manufacture of another person;" and "no man is permitted to use any mark, sign or symbol, device or other means, whereby, without making a direct false representation himself to a purchaser who purchases from him, he enables such purchaser to tell a lie, or to make false representations to somebody else who is the ultimate customer."

In the Middle Ages the dealings between merchants were ruled by the Law Merchant, which was a body of customary rules observed throughout Western Europe. At the present day most European nations have Codes de Commerce. We have not yet completely codified our commercial law, but we have made movements in that direction. We have such codifying acts as the Sale of Goods Act, the Bills of Exchange Act, the Partnership Act. When more work has been done in this direction it would be not only interesting to the scientific student of the law, but also practically useful to the merchant, to collect and state the principles of commercial morality which all codes alike endeavour to enforce. The case which we have commented on would seem to show that the editor of such a work would find a large mass of principles not only essentially the same, but expressed in almost identical language. We should find that there is a modern as well as a Mediæval Law Merchant.

ST. DAVIDS CATHEDRAL.*

THE peculiar position of St. Davids Cathedral necessarily hinders it from being at all a prominent object in any distant view. Lying in a deep hollow immediately below the town, from most points of view the body of the church is hardly visible, the upper part of the tower alone indicating its existence. And, consequently, even the tower itself is not seen to the same distance, nor does it form the same central point in the landscape as is the case with those churches which possess a greater advantage of position. Yet the situation of the cathedral can hardly be esteemed a disadvantage. It seems almost essential to the general idea of the place that the church and its surrounding buildings should be hardly discernible until the spectator has approached quite close to them. This circumstance certainly tends to increase the general feeling of wonder which the whole aspect of the place excites.

The character of St. Davids is altogether unique, unless Llandaff may be allowed to approach it in an inferior degree. Both agree in being cathedral churches whose surrounding cities claim no higher rank than that of mere villages. But Llandaff, a fabric on the whole far less striking than St. Davids, and still more deficient in the vast extent of episcopal and collegiate buildings which go so far to produce the general effect of the latter, has nothing of the strangely awful character derived from the position of St. Davids. The richer character of the country round, the neighbourhood of a large and busy town, take off much from the wild majesty which is so distinctive of St. Davids. Without the utter desolation of the surrounding country, and the entire separation from all traces of man besides its own narrow world, a large portion of the stern charm of "ancient Minevia" would be completely lost. The effect of Llandaff is a mixture of that of a ruined abbey and that of an ordinary parish church. St. Davids, standing erect amid desolation, alike in its fabric and its establishment, decayed but not dead, neglected but never entirely forsaken, still remaining in a corner of the world with its services

* From the *History and Antiquities of St. Davids*. Architectural Description of the Cathedral, by W. S. Jones, M.A., and E. A. Freeman, M.A.

uninterrupted in the coldest times, its ecclesiastical establishment comparatively untouched, is more than any other spot a link between the present and the past; nowhere has the present so firm and true a hold upon the past. Ruin and desolation speak of what has been, but not ruin and desolation alone; it still lives its old life, however feebly; all is uninterrupted retention, without change or restoration; the light first kindled by its original patriarch may have often shone but feebly in the darkness, may even now glimmer in the socket, but it still remains one and unextinguished; it has never at any moment required to be rekindled from any new or extraneous source.

Perhaps there is no church of the same size which exhibits the genuine cathedral type so thoroughly developed in every respect except one, which has no influence on its external appearance. In point of complication of ground-plan it ranks with—perhaps surpasses—Winchester or St. Albans; and the profusion of chapels and surrounding buildings has the advantage of restoring that varied and picturesque effect which might otherwise have been lost by the absence of any high-pitched roof. Besides the ordinary parts of a cruciform church, a succession of three chapels of inferior height is added to the east end of the choir, and the aisles of the latter are continued along them during a great portion of their extent. To the east face of the north transept is attached a lofty building of three stages containing the chapter-house and other apartments. This erection, which is, excepting of course the tower, the highest portion of the whole pile, naturally forms the most prominent feature in the eastern view, and imparts much variety and singularity to the outline. And as this same transept, at present at least, is connected with the ruined chapel of St. Mary's College, another extensive range is added to the main fabric, from which it can hardly be considered as architecturally distinct.

On proceeding to a more detailed examination of the several portions of this church we are met at starting by a sad deficiency in what usually forms the most striking and attractive external portion of a cathedral or other great church. The west front is modern, in what would have been called the worst form of the modern antique, had not that of Hereford exhibited an example of a still lower depth. To describe and criticise minutely a structure which combines Romanesque, Decorated and Perpendicular in one mass of hopeless confusion can hardly be required of an historian of St. Davids, but it is only just to mention that this front has escaped, in appearance at least, the great vice of such erections, flimsiness; even the quasi-flying buttresses which prop the ends of the nave walls are great solid masses, and the turrets from which they spring, as well as those at the angles of the aisles, are by no means contemptible for the end of the last century. The stone also, already weather-beaten, takes off from the effect of newness, and harmonises fairly with the general appearance of the church, though ragged ashlar is a far less pleasing object than the honest rubble of which the rest of the building is chiefly composed.

The nave and aisles viewed externally do not present much that calls for minute remark. They form a long, low, regular structure, broken only on the south, which is at once the part best preserved, and withal the original show side, by the necessary addition of a porch, and on the north by the vast props which the precarious condition of the fabric has rendered necessary in later times. The general appearance of this portion of the church has certainly suffered much more than the rest from the lowering of the roofs, which has not only caused a deprivation of positive height, but has introduced a real want of proportion. The aisles in their present form are lofty and the clerestory low; a high roof to the latter is therefore especially necessary in order to preserve the general importance of the nave.

The nave and aisles consist of six bays of unusual width; the aisles are lighted by a series of large three-light windows, interrupted only by the doorways in the second bay from the west. These windows were originally Decorated, and on the north side, at least, of the intersecting pattern, but the tracery remains untouched in one window only, on the north side. In three others on that side the Decorated tracery without being entirely removed has been converted into a strange and most unsightly kind of Perpendicular. In the rest the tracery is modern Decorated, which in all but the western window on each side supplants a Perpendicular insertion in the original jambs. The western pair previously to the late repair were blocked, with debased loopholes inserted. The jambs are somewhat

richer on the south side than the north. In the south aisle the bays are divided by rather weak buttresses terminating in plain octagonal pinnacles; in the north by flat pilasters, whose breadth diminishes at about half their height, with the exception of the western one, which is of the smaller breadth throughout.

In the clerestory we are struck by the fact that the north side is faced externally with ashlar, the rest of the external walls being, as we have said, chiefly composed of rubble. This, in fact, is the case with the south side also, but here the ashlar is concealed by plaster, this being the stormy as well as the show side. There is a corbel-table on the south side, but only extends along a small portion at the east end of the north. This difference, however, may be owing to later alterations of the parapet. Here in the clerestory the bays are not marked, and, there being two windows in each bay, they present a series of twelve windows—short, broad and perfectly Romanesque specimens—with a flat pilaster between each. But, unfortunately, the effect is very much marred by two windows on the north side and the alternate ones on the south being completely blocked. Those, moreover, which remain open have a wooden mullion awkwardly thrust in, while the eastern pair on the north side have at an earlier period suffered the insertion of exceeding poor tracery.

On the north side, as has been already mentioned, the aisle wall has had to be supported by enormous masses of masonry in the form of vast flying buttresses which would ordinarily be considered a disfigurement; but here, in connection with the general ruggedness of the external architecture, and especially from their close proximity to the ruins of St. Mary's College, they serve to add considerably to the strange and imposing effect of magnificent desolation produced by the whole scene.

The two doorways at present in use are, as was implied above, opposite to each other. The northern one is Norman, one of the very few examples of anything approaching to richness in external work throughout the church, and this exhibits no very great amount of decoration. Its arch is slightly segmental, of two orders with shafts, and an inner one with a large bowtell of hardly any projection, a form which we shall find in several other portions of the building. The mouldings of the arch begin to approximate to Early English, exhibiting specimens of those forms intermediate between the chevron and the tooth ornament, of which we shall find so rich a store within. On the label is an ornament representing lilies and the keystone is marked by a head.

The southern entrance is through a porch of two storeys, one of the least attractive features of the church, partly owing to its modern gable and unsightly external staircase, but quite as much to the poverty and coarseness of its original detail. The external doorway and the window over it in the parvise (now occupied as the chapter-house of the vicars choral) are Perpendicular of a poor kind. The former has a very slightly segmental arch, and its principal moulding is an enormous shallow cavetto. The window has a depressed arch and unfoliated intersecting tracery. On the east side there is a small circular aperture, with a label which appears to be of the same date. The original entrance to the parvise was from the interior of the church by a staircase turret, attached to the adjoining buttress, which is now much disfigured by the modern flight of steps.

The inner doorway, however, though much defaced, has clearly been, as in so many other cases, one of the most magnificent displays of ornament in the whole building; and we may observe that, contrary to the common rule, the original Norman doorway has given way to a later successor. From its plinths, portions of which still remain, it would appear to have been of unusually small size, which may possibly account for the change. The present doorway is Decorated, without shafts, but with a superb display of sculptured decoration, besides crockets and the ordinary four-leaved flower. The arch is adorned with a series of sculptures which are sadly mutilated, but in which we may still trace the familiar representation of the Root of Jesse. The position, however, necessarily involves some singularities, and, as in the better-known example of the Dorchester window, the genealogy is by no means easy to follow. The western impost is occupied by what appears to be a figure of Adam with Eve issuing from his side; the other supports the recumbent figure of Jesse, from whom springs the branch along which the figures are introduced, somewhat after the manner of the Norman medallions in one of the doorways

at Ifley. Some of the figures may be still discerned reading at desks; David with his harp may also be plainly seen, as well as a representation of the Crucifixion. Over the apex is an effigy of the Holy Trinity, with angels on each side bearing censers. The doorway has pinnacles at the sides, but they are cut off by the vaulting of the porch, which is plain quadripartite springing from the corbels, among which we may observe the ornament called the mask, the only example of that form to be found in the cathedral.

That the principal internal features of the nave are entirely Romanesque may have been already inferred from the clerestory; but the external appearance of that portion of the building would never suggest either the extreme richness of the internal architecture or the fact that the style is therein exhibited in its latest form. It would, in truth, be more accurately called Transitional; for although the employment of the round form in the main constructive arches produces the general impression of the former style, yet the details are very far advanced towards Gothic—much more so, indeed, than those of many structures in which the pointed arch is extensively employed. In fact, there is but very little difference in detail between the Romanesque of the nave and the Transitional work of the choir, and we shall find that the pointed arch is by no means excluded from the former either as a constructive or a decorative form.

Its general effect is extremely striking from the remarkable richness of the architecture and especially from its great multiplicity of parts, characters sufficiently marked to have been conspicuous anywhere, but which are the more strongly forced on the eye from their utter contrast with the rugged and weather-beaten aspect of the church without. Possibly the circumstances which conduced to the lack of external ornament may have led its designers to counterbalance this deficiency by a superabundance of internal decoration. Certain it is that very few structures of the same size equal this cathedral in the richness and elaborateness of execution lavished upon this portion of the interior. In fact, much of the solemnity of a Romanesque nave is lost, an effect which is certainly far better produced by more massive proportions and a greater extent of unadorned surface.

The deficiency of height which appears without is fully as perceptible in an internal view. Several circumstances, indeed, combine to render it especially conspicuous. The positive breadth is great; the span of the pier arches is immense; there is an entire absence of any vertical lines, and the character of the upper stages, where the whole extent of wall is filled up far more completely than is usual in such cases, conduces to the same result. Notwithstanding the width of the pier arches the real bulk of the piers hinders any great effect of lightness, while much of Romanesque solidity is lost. The piers are of no great height, consisting of masses alternately round and octagonal, with shafts attached to the cardinal points, those towards the aisles, which were designed as vaulting shafts, being themselves clustered. The capitals afford an interesting study. The prevalent type is a degenerate though by no means uncommon variety of the cushion form, though some are of other kinds, several being floriated, while two of the shafts attached to the first pair of piers from the east are remarkable for the exquisite grace of their foliage, which approaches much nearer to classical models than is at all usual in this country. A single capital on the north side retains vestiges of a small figure or statue which has been broken off. It is perhaps to be regretted that so many of the attached shafts, both here and throughout the church, are without a neck moulding, which detracts much from the completeness of their appearance.

A San Francisco family named Crocker have united in a plan to devote the whole block on which their homes formerly stood as a site for the new cathedral of the diocese of California.

The Report of the Council of the Manchester Whitworth Institute for the year 1905 refers in detail to the extension of the galleries now in progress. At present, for want of room, "a very large number of works of art and other objects of various kinds are stored in the dry and well-aired basement galleries." The buildings which have been recently commenced will complete the original design of the galleries, and will provide a façade, with a frontage about 210 feet long, facing Oxford Road.

IMPERIAL INSTITUTE.

THE report to the Board of Trade on the work of the Imperial Institute by Dr. Dunstan, the director, will enlighten many people about the services which are rendered by the staff. Since it was fully established in 1896 the work of the scientific and technical department has increased. In 1905 the staff consisted of 26 members, all of whom were qualified by scientific training to assist in the conduct of researches, and to supply scientific and technical information concerning the occurrence and production of economic products, their industrial uses and commercial value. In connection with the department a sample-room has been maintained for purposes of reference. It includes samples of all the important products which have been examined in and valued through the department, as to which full information is available. The reference sample-room has proved of great value in supplying information to manufacturers and others who have inquired about new sources of raw materials, and also to agricultural and other officials in the Colonies who have visited the Institute. A very large number of minerals have been examined and their chemical composition ascertained as the first step towards determining their commercial value. The resources of many of the colonies and protectorates being little known, it is important, with a view to development, that an inventory or catalogue *raisonné* of their products should be prepared and a decision arrived at as to those materials which are likely to repay collection or cultivation. The Imperial Institute has devoted special attention to the examination of colonial timbers, and in conjunction with Professor W. C. Unwin and Mr. Herbert Stone, who have respectively undertaken the determination of the mechanical properties and working qualities of the woods, a large number of specimens have been examined. During 1905 a collection of twenty-one timbers from Southern Nigeria was received, and the investigation of these was in progress at the close of the year. Samples of timbers derived from species of *Podocarpus* and *Juniperus* in the East Africa Protectorate have been examined. The latter wood, probably obtained from *Juniperus procera*, was found to be very suitable for use as "pencil cedar," and arrangements are being made for its commercial exploitation.

Three mineral surveys of British Possessions are at present being conducted by officers specially appointed by the Colonial Office, and who work under the supervision of the director of the Imperial Institute.

Thorianite, which is found in Ceylon, contains nearly 80 per cent. of the rare earth thoria, which is the principal constituent of the mantles used for incandescent gas-lighting. The new mineral is now being largely employed both in this country and in Germany for the manufacture of thorium nitrate, the form in which the thoria is applied in the preparation of mantles, and consignments of the mineral have been sold at the rate of 22*l.* 10*s.* per unit per cent. of thoria per ton, equivalent to over 1,600*l.* per ton for the crude mineral. The discovery of thorianite is therefore a matter of commercial importance to Ceylon, and, in addition, it has enabled at least two firms in this country to commence the manufacture of thorium nitrate, a branch of industry which British firms were previously prevented from carrying on owing to the fact that the available supplies of monazite, the mineral from which thoria has been, and is still, principally obtained, were controlled by a syndicate having its headquarters in Berlin. Thorium-bearing minerals appear to be widely distributed in Ceylon, and in addition to thorianite, thorite and a number of other minerals containing various proportions of thoria, several of them worth working commercially for this oxide, have been discovered. These are still under investigation, but it may be mentioned that monazite containing as much as 10 per cent. of thoria, as against the 5 or 6 per cent. of thoria found in Brazilian and Carolina monazites, has been discovered recently among the minerals forwarded for examination to the Imperial Institute by the officers of the survey.

Recently a careful examination of the sands and gravels of the river beds in Ceylon has been made, and as a result a large collection of concentrates containing small quantities of gold have been sent to the Imperial Institute, and is at present under investigation. Other subjects which have engaged the attention of the survey have been mica, graphite, kaolin and molybdenite, and the value of all these minerals has been reported on or they are at present under investigation.

As a result of the operations of the mineral survey in

Ceylon, great interest has been stimulated in the mineral deposits of the island, and during the year over 158 samples of Ceylon minerals were submitted, at the instance of the Government, by private individuals in Ceylon and commercial firms for identification and valuation. Among these were many samples of thorianite, thorite and other minerals of economic value, and in several cases it was found possible to place Ceylon firms who had secured supplies of these minerals of commercial value into communication with firms using these products in this country.

The survey of Southern Nigeria was commenced in 1903. Since the commencement of the survey the deposits of lignite at Asaba have been systematically surveyed, and a number of typical specimens of this material have been fully examined at the Imperial Institute. The lignite proved to be of good quality, burns well, has a high calorific value and yields a good quality of illuminating gas. The discovery of these considerable deposits of good lignite is of great importance in West Africa, where the scarcity of fuel other than timber is a serious impediment to development.

The officers of the survey have also discovered that the valuable minerals, monazite and cassiterite (tinstone), are widely distributed in Southern Nigeria, and a large number of concentrates containing these minerals have been sent to the Imperial Institute and have been examined. It is not yet certain whether the crude gravels are rich enough to warrant exploitation for these minerals, and further investigations on this point are required. Recently the officers of the survey have made a systematic examination of the asphaltic or natural pitch deposits at Ijebu in Lagos, and a large number of samples of this material have been sent to the Imperial Institute and are at present undergoing investigation.

When completely reorganised the collections will, it is hoped, attract visitors in increasing numbers on a scale corresponding with those who now resort to the neighbouring Victoria and Albert Museum and the Natural History Museum. Some steps are, however, needed to make the public collections more widely known, and among these may be mentioned the provision of better and more conspicuous public entrances. The central stand, which serves as a general inquiry office in the public galleries and a means of regulating the distribution of literature relating to India and the Colonies, has proved to be a useful feature; 7,510 publications were distributed to inquirers during the year, and over 150 special inquiries, chiefly relating to emigration, settlement, planting, climate, agriculture and forestry, were dealt with by the expert staff.

GERMAN ART.

A LECTURE was delivered by Professor Hoetzsch in the University of Edinburgh on "German Literature and Art since 1871." In the course of it he said that in Germany there was not one great centre of life and culture, as in France and England, but a number of such centres. That prevented in the case of literature and art one metropolitan taste from tyrannising over others. Literary and artistic life were thus decentralised in Berlin, in Dresden, in Munich and several other towns, and was all the richer for that variety. After 1871 it was expected in Germany that a great national art would arise. This expectation was, however, only realised in the case of music, in the genius of Richard Wagner. In painting, brilliant colour was the dominant feature, then realism, at last impressionism and symbolism. Turner and Whistler both exercised influence upon German painting. At last the pre-Raphaelites, *e.g.* Burne-Jones and Dante Gabriel Rossetti, became names very familiar to German painters. The greatest painters in the last thirty years were Menzel, Böcklin and Klinger, the only one of the trio who is still living. English art industry had an ever-increasing influence on the German one. Morris and Walter Crane had found many admirers in Germany. Germany had to-day a national art industry, and visitors of the Dresden exhibition this year could not help seeing its development, and also noticing how house architecture and furniture were affected by English models. For proof of that, he said, one might also refer to the fact that John Ruskin's works were widely read in Germany. Ruskin's ideals were exactly the same as Wagner's; both regarded the productions of art as one form in which the entire life of a nation manifested itself. Both could not regard a work of art as a mere object of enjoyment, but

said that art had a moral task and a moral significance. Like Ruskin the German painters enunciate that painting was not an intellectual art or an abstraction, but one of observation, which depended upon the impressions received by the soul and not alone by the senses.

THE CITY OF GUAYAQUIL.

A REPORT by the British Consul on the trade of Ecuador and the progress of Guayaquil between 1899 and 1905 has been issued. It says that the general progress of Guayaquil during six years has been considerable. The fires of 1896 had destroyed the northern part of the city, including the four banks, the artillery barracks, the Customs House, the Girls' Conventual College, five of the principal churches, and in value more than two-thirds of the whole city. Of these buildings the churches of San Francisco, the Merced, San Augustine, Concepcion and Parroquia have been rebuilt. The four banks have erected buildings for their own service on their own lands. The Customs House has been reconstructed, although only in the commonest and cheapest form of cane buildings, yet sufficient for the storage of all the imports to Guayaquil. About one-half to two-thirds of the house property destroyed in these and subsequent fires has been rebuilt, with wide streets and better precautions against fire risk, and the city has resumed its ordinary business-like appearance.

During the last two years a very complete and well-planned system of protection against fire has been adopted throughout all the most valuable portions of the city, extending even to the less valuable outskirts. It consists of a system of pipes for the supply of water, the principal line being of 16 inches in diameter, the medium of 12 inches and the smallest of 8 inches. These pipes are supplied—first, by tanks with a capacity of 880,000 gallons, erected on a hill at a height of 275 feet, kept constantly full; second, by three Worthington pumps (one always ready for service, the two others in a condition to be at work within one hour or less after the first alarm of fire), capable of supplying each 1,500,000 gallons per minute. In consequence of this the conflagration risk has entirely disappeared from Guayaquil, and none of the recent fires, even though threatening severe consequences, has extended (when met by the water system) beyond the original district in which it started. The adoption of this system has caused a reduction in Guayaquil of 25 per cent. in the tariff of fire insurance companies; but it is generally considered, and personally the Consul is of the same view, that this reduction is entirely inadequate, and that if the present rates are insisted upon, we shall see fire insurance business with the United Kingdom, which to-day presents an annual premium of nearly 400,000 sucres (40,000*l.*), diminishing or even disappearing through the discontinuance of the insurances. A national insurance company has been started, with 300,000 sucres (30,000*l.*) capital, which does business at about 20 per cent. below the foreign companies. The competition is, however, so far not a serious one, as the total amount of insurance effected by the new company has been only 300,000 sucres, or say 30,000*l.* in eight months, which equals 45,000*l.* per annum, as against a total of 6,000,000 sucres (600,000*l.*) per year insured by the foreign companies. The fire of 1902 destroyed the Guayaquil hospital, which had till then been situated almost in the centre of the town.

During the period many charitable establishments have been built. Apart from the two fine hospitals there have been established the Asilo Galecio for children, the Providencia residence school for orphans, &c.; an infant asylum for children in the western suburbs of the city and the Instituto Ayulardo at the Terrasana, on the outskirts of the city. All of these establishments are self-supporting, from bequests of philanthropic persons or otherwise. The Beneficencia Municipal (Municipal Beneficence Council) has improved and extended the cemetery. The Board of Health has built a small but airy and isolated lazaretto for yellow fever patients and a floating quarantine station for incoming passengers—small, but so far adequate for nearly all arrivals; and has also obtained, through subscriptions received from the commercial community, a floating Clayton apparatus for fumigating suspected or infected ships arriving at the port, thus avoiding all necessity of refusing admittance to vessels calling at Guayaquil from infected ports or with sickness on board. The Government has rebuilt, at a heavy cost, the San Vicente College (now styled the Colegio San Vicente).

NOTES AND COMMENTS.

THE County Council of Wiltshire have evidently resolved to take advantage of the number of candidates in the market when making arrangements for the appointment of a county surveyor. The county is an important one and offers a variety of work to an official engineer. But the salary to be given is only 500*l.* a year. The usual custom of allowing the county surveyor to add to his salary by the fees of pupils will not be tolerated. Nor must the official look forward to any superannuation or compensation when his employment ceases. For the small salary of 500*l.* a man who is to be competent to undertake engineering, surveying and architectural duties will be expected to give his whole time. The extent of the responsibility may be judged from an amendment which proposed that for roadwork there should be four surveyors each with a salary of 300*l.* a year, and that for buildings a county architect with a salary of 400*l.* a year should be appointed. The amendment was, however, lost, and the original report adopted. Last year, it appears, the county surveyor had to carry out work to the extent of 63,000*l.* It is therefore expected that the new officer will supervise what will probably cost a much larger sum for a salary which does not amount to 1 per cent. on the outlay.

THE cathedral church of St. Stephen in Vienna has been so thoroughly examined from time to time it might be supposed that every part of it was well known to archæologists. Quite recently, however, four oil-paintings have been discovered in what is known as the Upper Sacristy. They were covered with dust, but it shows great carelessness that they should have been allowed to fall into a state in which they appear to be characterless. They have at length been carefully cleaned, and it is found that one represents St. STEPHEN preaching and the other his stoning. The other pair likewise deal with the preaching and death of an apostle; but at present the subject cannot be identified. The discovery caused further searches to be made, and in the Under Sacristy a large painting was found representing ELIAS. The pictures are believed to have been executed in the early part of the eighteenth century by the Brothers ALTOMONTE, whose other works are forgotten. It is not unlikely they are the works of STEPHEN and JOSEPH DANEDI, who were sometimes called MONTALTI.

ACCORDING to the *Architects and Builders' Journal* of Baltimore, the committee having in charge the laws which will govern the erection of new buildings in San Francisco have decided that the height of skyscrapers, class A, steel-brick buildings, will be limited to two and one-half times the width of the street on which they may be located. This will permit the erection of buildings more than 200 feet high on Market Street and limit them to 155 feet on Montgomery Street. The heights of other than class A buildings have been fixed as follows:—Class B, fireproof buildings, 102 feet; class C building, with metal lath, 70 feet, and with wooden lath, 55 feet; frame buildings, 45 feet. Class A and class B buildings are to be built of incombustible materials and allowed in any part of the city. Class A buildings are to have steel frames carrying all wall and floor loads. Class B buildings are to be built either with steel or reinforced concrete walls supporting a part of the floor loads, or with walls self-supporting only, the floor being carried on the steel frame; all floors to be fireproof, and, except the frame, to be equal in all respects to class A. Class C buildings are to be built with brick or concrete walls and timber interior, to be in effect the same as class B. Class C buildings of this sort will be allowed in all parts of the city. It is evident that the hesitation, which was natural after the bewilderment caused by the fire, is now at an end.

During the month of July no less than 470 building permits were issued, the value of which amounted to 702,800*l.* One hundred and thirty-two building contracts were also arranged, and it was estimated that about 25,000 men were engaged in the reconstruction of the city. Another sign of business is found in the fact that more than fifty applications for certificates to practise architecture have been lodged with the State Board.

BEDDINGHAM Church is close to the town of Lewes. It is an old building with a tower which is considered so unsafe that the bells have had to be silent for many years. It is known that three of the bells were cast in 1639, while the fourth belongs to a still earlier period. It is anomalous to have bells which cannot be heard, and the parishioners and residents of the district have lately met to consider the subject. Mr. L. W. RIDGE, the diocesan surveyor, after an examination, said he found cracks in the tower which required immediate attention. As to the old bells, he advised that a founder should be consulted. That course was adopted, and it was estimated that the bells could be repaired for 152*l.* The cost of the reparation of the tower will have to be added to that sum. A previous effort to make the work a Jubilee memorial was not supported.

ALL visitors to Antwerp are acquainted with the exterior, at least, of RUBENS's house in the Place de Meir. It is at present private property, but the mansion will shortly be purchased by a committee who will restore it, and then it will be presented to Antwerp in order, if possible, to convert it into a Musée Rubens. The plans for restoration will be prepared by M. BLOMME. Enough drawings and documents exist to enable an architect to realise the original condition of the building. RUBENS was not only a painter, but an ambassador, and he lived in princely state. He erected a studio which was adorned with sculpture, but the greater part of it has disappeared. He had no admiration for the Gothic style, of which several examples survive in Antwerp, nor of the adaptations of it. He wished to set an example to the rich citizens by demonstrating what could be done in the Italian style. But it cannot be said that the façade of the building to the Place de Meir recalls the mansions to be found in Italy. It gives the impression of a very free adaptation of Italian work by a Fleming. The present owner of the building, the Baron PIERRE DE CATERS, is favourably disposed towards the project.

LECTURES and demonstrations in sanitary science as applied to buildings and public works will begin at the Royal Sanitary Institute on September 10, and will continue until November 9. In addition to demonstrations with the aid of objects in the Parkes Museum, there will be visits to several buildings in which sanitary works have been undertaken. The lectures and demonstrations will be preparatory to the examinations of the Institute held in December next. The fee for attending the twenty-five lectures and twenty inspections and demonstrations is 2*l.* 12*s.* 6*d.* But students who enter for examination can have 10*s.* 6*d.* carried towards their fees.

ARCHITECTURE IN MELBOURNE.

THE presidential address for 1906 of the Royal Victorian Institute of Architects was delivered by Mr. C. A. D'Ebro, A.M.I.C.E. He said:—

I cannot help thinking that there is a brighter outlook for architects than there has been for many years. The general progress of the Commonwealth in natural development must of necessity show in accumulation of capital. It is to be hoped that our political leaders will, by a more settled policy, encourage the expenditure of this accumulation by the erection of buildings for remunerative purposes, or what is one of the best evidences of the prosperity of any country—well-cared-for homes.

Our profession is, unfortunately, not sufficiently recognised in the State to bring its members under a scheme of registration, but I hope that in time this will come. I am pleased to say that there is far more enthusiasm among the young men who are entering into it, and it is only by exhibiting a high sense of honour that we shall gain the respect of the public. Unfortunately, there have been several cases which have been brought prominently into public notice, where this sense of honour has been lacking, and these have not done our profession any credit.

During the past session we have had many very good papers brought before the notice of the members at the meetings, but I frankly admit that there is very little encouragement given to the authors, as the meetings are not as well attended as they should be. It is to be hoped that, ere long, an amalgamation of kindred institutions will be obtained by meetings being held in more attractive surroundings, and if the scheme which is under consideration for the joint occupancy of some central building can be arranged, it may help in the right direction. The consideration of the federation of the various State Architectural Institutes has, unfortunately, been postponed, but I trust later on a move will be made to bring about this union, as the federation of interests and aims must be to the advantage of all concerned.

As has been reported by the Council, a readjustment of many of the clauses in our articles of association has been under consideration, and I hope that our efforts will ultimately—when approved by the members—give us power to deal with cases of unprofessional conduct which at present we do not possess. It must not be assumed that we are banded together only for our own benefit, but if we raise the standard of the Institute it will be to the advantage of the public, our employers, and through us the quality of work carried out by the builders, to whom we stand in the position of unprejudiced arbitrators, as well as the originators of the various schemes entrusted to us.

The success which has attended the recent exhibition of Australian manufactures proves the interest taken by the public in these matters, and apart from those features of natural productions of the soil, some of the exhibits possessed real interest to us, as being closely allied to architecture. There were many specimens of the cabinet-maker's art, which were very creditable both in design and execution, and it was a great advantage to inspect them whilst concentrated under one roof. There is no doubt that with encouragement our artisans can produce work which will favourably compare with the imported article, and the specimens of timber from Queensland were of great interest, as well as those from our own State. With regard to the possibility of getting these timbers in marketable quantities, I have no doubt that with the increased demand a regular supply will ensue, and here again a code of business morality will have to be maintained to enable us when specifying a class of material to anticipate getting what we order. This can only be obtained by the expenditure of capital and postponement of profit. There are immense stores of timber suitable for building requirements, but the natural characteristics of these necessitate their being cut at suitable times and proper seasoning.

I cannot help thinking that more encouragement should be given to the discovery and working of various deposits of stone and marble in the various States, but owing to their inaccessibility this must be a matter of time, depending on the opening up of, at present, unsettled country. I hope that even when our buildings are constructed as Edison stated, by pouring them out—i.e. by "concrete in moulds"—it will be found that the natural material will still have attractions to persons who have not lost all artistic feeling.

The report of the Council stated that the invitation to submit competitive designs for the Melbourne hospital (the conditions of which were generally approved by the

Council in 1904) was well responded to by the profession throughout Australia, a large number of designs being received. The hospital committee asked the Institute to nominate two assessors to advise the committee. Messrs. D'Ebro and Askew were nominated, and the nominations were accepted by the hospital committee. The assessors performed their duty and handed in their report. For reasons of its own, the hospital committee rejected the recommendations of the sub-committee, which included the assessors. When your late Council agreed to the nomination of assessors it was believed that the custom of adopting the views of such assessors would be followed. In this case the joint committee of architectural assessors and medical experts submitted a unanimous report, which the committee as a whole rejected. Although nominally within its rights, the result of the competition is a great disappointment.

Your Council are drafting various amendments in the articles of association. The first will permit a candidate to be elected as Associate after seven years practice, without passing the qualifying examination. The second will make it obligatory that before nomination as a Fellow the candidate shall have practised for ten years (in lieu of seven, as at present). A third amendment deals with the unprofessional conduct of any member, simplifying the procedure to be adopted in the first stages of the inquiry, and rendering it impossible for any member to resign after "misconduct" has been brought under the notice of the Council, or until the ultimate decision has been arrived at.

YORK MINSTER.

THE Dean of York, in his ninth "Occasional Paper," observes that the progress of the work at York Minster during the past twelve months has not been so apparent as heretofore, and therefore some have fancied that little or nothing has been done and others are disappointed that the great scaffolding is not yet entirely removed from the Minster. Nevertheless the large staff of masons, carvers and labourers has been kept in full occupation, and none of them relegated to the ranks of the "unemployed."

Two great works have rendered them very busy, one being the restoration of the great west window, the other the completion of two of the flying buttresses. As regards the former it has been not only a considerable work, but a work of great interest. As usual, it is difficult to estimate the size of anything which has to be done in the Minster, and few would imagine at first sight the vast proportions of the great west window, a grand specimen of the "Flamboyant" or latest development of the Decorated order of Gothic architecture, consisting of eight lights, together with a considerable amount of tracery, altogether measuring 54 feet 4 inches in height, 25 feet 4 inches in breadth, and containing 958 superficial feet of glass. At the beginning of the nineteenth century the whole of the west front had been practically refaced by Mr. Shout, the master mason, assisted by Mr. Taylor, a local sculptor. The external work seems to have been very carefully done, and is no doubt in some respects a fair restoration, but as the revival of the spirit of Gothic architecture was then only in its infancy the work lacks the spirit and tone of the Mediæval craftsmen, and is tame in comparison with the vigour of their productions. The internal and substantial part of the restoration was, however, not so successful, and the bonding of the stones had been so carelessly and imperfectly carried out that many had fallen, many were insecure, and nothing short of the thorough restoration of the whole, which is not yet completed, would be sufficient for the safety and beauty of the building.

In the west window large plates of "Hartley's rough-patent glass" had been inserted in order to protect the Mediæval painted glass, but these plates had been fastened into their position with iron bars, which had contracted and expanded according to the varying temperature to which they were exposed, breaking the rough plates of glass and splitting the stone mullions. These latter have now been thoroughly repaired, the rough glass removed and replaced by a complete skin of clear "crown glass" in diamond quarries, similar to the work done at the chapter-house. It will be impossible to fully judge of the effect produced until the scaffolding is finally removed, but it is possible already to see that the brilliancy and beauty of the window will be thoroughly restored. And it certainly deserves all the work and trouble that have been expended upon it, not only from

the intrinsic merit of the Mediæval art therein, but from its historical associations with one of the last, and certainly not the least, of the builders of the nave. For it is almost the only window in the Minster which can be authoritatively identified with its donor.

In Archbishop Melton's Register the following entry occurs:—"2a Non. Feb. 1338, Magistro Thomæ Sampson vel Thomæ de Ludham custodi fabricæ eccl. B. Petri, Ebor, 100 marcas pro opere vitreo fenestræ ex capite occidentali eccl. ejusdem de novo constructæ," which implies that the stonework of the window was carried out under his directions, and distinctly states that he gave the glass. The subject of the window, however, is not very clear. At the base there are eight full-length mitred figures, and above them a row of eight similar figures, one a woman, probably St. Catherine, each head surmounted with a coloured nimbus. The row above contains smaller figures, single and in groups, and above is a female figure, probably the Virgin Mary, with an angel saluting.

The value of the window has, however, been materially affected by the treatment of it which took place, Mr. Brown tells us, in 1757, when the stonework was "extensively repaired and the ornamental glass was at the same time repaired not very skilfully indeed by the glaziers of the church. The most important part of the work was performed by a young and ingenious artist, Mr. William Peckitt, of York, who was employed in restoring the heads of the bishops and other eminent persons represented in the window, which appear to have been wantonly injured and generally destroyed." The present window is therefore but a wreck of the original work; most of the faces of the figures are modern and there is a terrible admixture of eighteenth-century glass with the Mediæval glass throughout. Nevertheless, the general effect is very striking, and it is not unworthy of the position which it holds in the Minster. Archbishop Melton, under whose auspices it was erected and by whose munificence it was completed, filled the office of Archbishop of York from 1317-40. He was a native of a little hamlet called Melton, in the parish of Welton, near Howden, in this county, which was then a residence of the Bishops of Durham.

During his term of office Archbishop Melton devoted himself to accomplish if possible the great work which his four predecessors had striven so hard to carry on, the completion of the nave and west front of York Minster. It is impossible to say that he actually achieved this, and Brown assigns that honour to Archbishop Thoresby some six years after, but we are certainly indebted to him for the beautiful west window and possibly for the elaborate double doorway beneath, and his antecedents show that he was well qualified for such a task, for "he was, doubtless," says Chancellor Raine, "the builder of the noble church of Patrington, in Holderness. He helped to raise the glorious Minster of which Beverley may still be proud, and at Ripon and at Southwell he is not yet forgotten. He built also and endowed a chapel in the village of Melton, in which father, mother and son were to be commemorated." In 1329 he consecrated the parish church of Wakefield, rebuilt after the fall of its predecessor some years before, and now become a cathedral.

The following reports are appended:—

7 Gray's Inn Square, London, W.C.: May 1906.

Dear Mr. Dean,—I beg to report that I have inspected the works of repair that have been going on at the Minster. As was but too evident, the decay of the stone was such that important and beautiful features would have been irreparably lost. We were but in time to stay them. Much remains to be done. It should be carried out in a spirit as conservative as is possible. The work done has been well done. The new stone is of a durable nature. The improvement to the look of the north side of the nave and its aisle, by recalling the flying buttresses, is surprising. This was indeed but to be expected. The aisle wall as it was had a stunted and an altogether incomplete appearance, wholly out of proportion with the surrounding beautiful architecture. The clerestory wall was bare. The more distant view that one gets on the north side enables us to see the admirable design of the original fabric. For these flying buttresses are altogether part, an integral part, of the fourteenth-century intention. How much the design suffered from their destruction will, I hope, soon only be seen by the evidence of old prints. The artistic effect is to again lift that side of the Minster to its due proportion, and the constructional gain is the added strength for its longer continuance. I hope this good work may go on.—Faithfully yours, G. F. BODLEY, R.A.

Clerk of Works Office, York Minster: May 22, 1906.

Very Rev. Sir,—Since your last "Occasional Paper" was issued 6,396 cubic feet of stone have passed through the hands of the masons and carvers. This represents in weight about 490 tons.

The pinnacle over the west gable is completed. The east and north sides of the south-west tower are completed and the scaffold removed. On the west side the buttress gables on the fourth stage have been partly renewed and new pinnacles and finials fixed. On the south side the work on the fifth and sixth stages completed and these stages of scaffold removed.

The west window mullions and tracery have been restored and the outer glazing entirely renewed, lead glazing being substituted for the old plate glass, which was in a very bad state, only one panel of which remained whole. This window measures 54 feet wide. The glazing amounts to 958 superficial feet.

The Becket window in the south choir aisle was found to be in a very bad state. A scaffold was erected, the tracery taken out and almost renewed and reglazed.

On the north side of the nave two pinnacles and flying buttresses have been erected, the scaffold removed from these and erected to the next two buttresses. On these buttresses pinnacles are now in course of erection. All the stonework for these is worked and ready for fixing.

On the south side of the nave one flying buttress is completed, one in course of erection, and the whole of the stonework prepared for a third buttress.—I am, Very Rev. Sir, yours respectfully, R. GREEN, Clerk of the Works.

FYVIE CASTLE.

FYVIE Castle, the residence of Lord Leith, which is being visited by the King and Queen of Spain, occupies a pleasant seat in the fair and fertile district of Buchan, in Aberdeenshire. Situated on the left bank of the Ythan, says the *Scotsman*, it rises, a noble pile, with its mass of towers and turrets, its sharp gables, pointed roofs and canopied dormer windows, from an extensive natural plateau, encircled on two sides by the river and surrounded by beautiful woodlands. Dating from the fourteenth century, it has been added to and improved by its respective owners during these five hundred odd years, and its outstanding architectural features are the five towers, all in harmony with the original design, that mark the different periods. These towers are named respectively Preston (1390), Meldrum (1460), Seton (circa 1596), Gordon (1777) and Leith-Forbes (1890). The more ancient of these structures have both their historical memories and legendary lore. The Preston tower was enlarged and heightened by the Sir Henry to whom Robert III. assigned Fyvie for the redemption of Sir Robert Percy, brother of Hotspur, taken prisoner by him at Otterburne. The Seton tower, which forms the centre of the castle's south front, was the work of the first Lord Fyvie, who, a trusted friend of the sixth James, played a great part in the important politics of his time. He continued Chancellor of Scotland till his death, which occurred at Pinkie House, near Musselburgh, in 1622. The castle was to a large extent remodelled in his time, and to him also was due the artistic embellishment of the grand staircase, by the insertion of the heraldic devices. This great stair, by the way, is described by Billings, in his "Baronial Antiquities of Scotland," as an architectural triumph. It is arranged in corkscrew fashion round a massive pillar; and the ascent is so easy that it has been said that the laird's horse might walk up the steps without a stumble. Prior to the time of the present edifice there existed a castle or keep which is said to have been visited by Edward I. of England, and which was subsequently one of the hunting seats of Robert the Bruce. The ancient stronghold was once the scene of a siege, in which it was defended, and that successfully, by the Lady Lindsay against her nephew, Robert de Keith; and, coming to later times, an engagement lasting three days took place near it between the forces of Montrose and Argyll. Some legends cluster round the place, and that touching tale of the love of the trumpeter of Fyvie for Tifty's Annie has a national reputation. Behind the Preston tower is a stone figure representing Andrew Lammie blowing his horn towards the home of the beloved one, whose parents, deeming a miller's daughter a match much too good for a humble instrumentalist like the individual in question, ruthlessly withheld their consent to a marriage.

There cling also about the old place traditions of a picturesque curse by that master of magic and spells, Thomas the Rhymer, and of the presence of a "green ladie," who appears only when calamity is impending, so that Fyvie is furnished with the orthodox supernatural appurtenances without which no ancient castle of the first rank can be considered complete. Since he purchased the property in 1889, Lord Leith has effected several improvements which have added greatly to the beauty of both the exterior and interior of the noble building.

STOKE POGES.*

WE have just visited the church which has been immortalised, as no other church in England has been immortalised, by the supreme effort of the genius of one poet. Gray's *Elegy* is famous wherever the English language is spoken and English literature loved, and here flock hundreds of our brethren from across the seas to see the country churchyard where that *Elegy* was written. Perhaps it is unnecessary to state that other churches have laid claim to the honour of being the church of the *Elegy*. The only serious rival to Stoke Poges is Upton. But the circumstances of the poet's life, his connection with this village, the different points in the description, the "ivy-mantled tower," "the rugged elms," "the yew tree's shade," "yon wood," "the heath," all seem to unite to indicate that it was here Gray mused and wrote, and to-day we cannot allow any rival claims to disturb our reflections. About this place there lingers the personal note of undisturbed calm, of the peace found "far from the madding crowd's ignoble strife." Gray was a man whom melancholy marked for her own. He told the keynote of his life in these words:—"Low spirits are my true and faithful companions; they get up with me, go to bed with me, make journeys and return as I do, nay, and pay visits, but most commonly we sit alone altogether." He was a man of many friendships, who, as Johnson said of him, "was likely to love much when he loved at all," and who proved this true by his deep absorbing attachment to his mother. You have to-day that touching epitaph to "the careful tender mother of many children, of whom one alone had his misfortune to survive her." Gray's mother did not come to live at Stoke Poges until he was twenty-five years old, but before the place became his home he was in the habit of often spending his college vacations at his aunt's house. This lady was Mrs. Rogers, who lived in a house then called West End Cottage—now Stoke Court—which he described as a "compact box of red brick with sash windows." It has since his day been much enlarged and beautified. The poet's room is still preserved. His memorial, too, stands in the park, erected in the execrable taste of the late years of the eighteenth century. It is a sort of sarcophagus, more nearly resembling an enlarged tea-caddy, with some lines of the poet inscribed on each face.

The old manor-house in which we are assembled is also connected with Gray, as it was described by him in his poem called "The Long Story." They would recognise the place by the following verse in the poem:—

In Britain's isle, no matter where,
An ancient pile of building stands,
The Huntingdons and Hattons there
Employed the power of fairy hands
To raise the ceiling's fretted height,
Each panel in achievements clothing,
Rich windows that exclude the light,
And passages that lead to nothing.

The present building is only a fragment, a dilapidated fragment, of the great house that once stood here. In 1789 the house needed some repairs, and in the usual barbarous fashion of those days the difficulty of repairing it was solved by pulling it down. Only one wing was spared, the beautiful and picturesque building in which we are now assembled. The manor is mentioned in Domesday, and was formerly held by a family which took its name from the place. At length Amicia de Stoke (I am quoting from the latest edition of Murray's "Bucks" which I revised a few years ago, and it is allowed, I think, for an author to quote from his own work) married Robert Poges, and thus

Stoke became Stoke Poges. Their granddaughter Egidia married Sir John Moleyns, who became lord of the manor in 1340. He was at one time rather unfortunate, as he had all his lands, goods and chattels seized by the king. However, five years later he was restored to royal favour, and obtained restitution of all his lands. He was Treasurer of the Chamber to Edward III., and obtained the grant "by charter of a fair yearly on the eve-day and morrow of the Feast of St. Barnabas." From this Sir John the manor descended through heiresses to Hastings, Earl of Huntingdon, who rebuilt the house in the reign of Elizabeth, the wing of which they now saw. And now came the queen herself, as was her wont to visit the houses of her chief subjects, and to half ruin them by the extent of the hospitality she demanded. She was the guest here in 1601 of a remarkable man, Sir Edward Coke, who entertained her with great magnificence. In this hall Queen Elizabeth was entertained. Over the fireplace are the arms of Hastings, Earl of Huntingdon, who must have married into the family of the Earls of Warwick, as their badge, the bear and ragged staff, appears. There are also the arms of the Montagues and the Moleyns impaling Hungerford. The fireplace has been altered. There are figures of Queen Elizabeth and Sir Walter Raleigh, and the initials E.L. These stand for Edwin Landseer, who in that room painted most of his famous pictures. The hall is now double the size of what it was in Elizabeth's time. In this house Sir Edward Coke, the author of the great legal work, "Commentary on Littleton," the entertainer of Queen Elizabeth, passed many sad days. He was very unfortunate in his second marriage, and had terrible experiences of matrimonial martyrdom. His wife was the daughter of Lord Burleigh, and widow of Sir William Newport, who was a nephew of Sir Christopher Hatton. These walls have heard many angry quarrels, and the lady hated her old husband, deserted him and went off to London. One day she heard he was dead, and hurried here to take possession of the house and property. The report of her husband's death was false, and when she arrived at Colnbrook on her way here and discovered that her husband had wronged her so much as to be still alive, she returned, most indignant at his base conduct, to London. Other troubles befell the old man. He was accused of favouring the Parliament in 1629 against King Charles I., and Sir Francis Windebank with a posse of troopers came here and ransacked the house and seized all his papers. This was too much for the old man—"alone on earth, suspected by his king, deserted by his wife," he ended his miserable life. His daughter, Lady Villiers, the wife of John Villiers, brother of the Duke of Buckingham, came to him on his death-bed. This Villiers was created Baron Villiers of Stoke Poges and Viscount Purbeck. The lady was not remarkable for her virtue, and was condemned to do public penance for her crimes.

A few words must be said about Gray's "Long Story" connected with that house. The story concerns Sir Christopher Hatton, Lord Chancellor in the time of Elizabeth. He is said to have lived there, and Gray tells—

Full oft within these spacious walls
When he had fifty winters o'er him,
The grave Lord Keeper led the brawls,
The seals and maces danced before him.

It is extremely doubtful whether Sir Christopher ever lived there, because the unhappy Sir Edward Coke resided here. The only connection between the Hattons and this place is that Sir Edward Coke's second wife, who treated him so badly, was the widow of Sir William Newport, who was nephew and heir of Sir Christopher, and took the name of Hatton. In this house Charles I. was confined a prisoner of the Parliament in 1647. In a small room they would see some paintings on the wall said to have been made by the Royalist prisoners who were with him. There is a figure of an ostrich, the arms of Warwick (bear and ragged staff), and some excellent mottoes—"Fear the Lord—Obey thy prince—Love thy neighbour—Beware of pride—Speak the truth—Bear no mallis." The spelling of some of the words would commend itself to Mr. Carnegie and others who were trying to reform the spelling of our English words.

When Baron Villiers, or Lord Purbeck, died, the husband of the daughter of Sir Edward Coke, his heirs sold this house and property to Sir John Gayer, Lord Mayor of London, some two centuries and a half ago. He founded the "Lion sermon," which is still preached every year on October 16 at St. Catherine Cree Church in Leadenhall Street. This Sir John was a merchant venturer, and

* A paper read by the Rev. P. H. Ditchfield after the visit of the Berks County Archaeological Society, and reprinted from the *Reading Mercury*.

accompanied an expedition to the East. On the evening of October 16 he was separated from his caravan and confronted by lions, and then prayed the prayer of Daniel for deliverance, and his life was saved. In thankfulness for his escape he left money for the maintenance of "his Lion sermon," which records his memory and his wonderful deliverance. During the Commonwealth period, in 1647, he was Lord Mayor, and with four Aldermen was committed as a prisoner to the Tower for refusing to comply with a demand for a subsidy for the Parliamentary troops. That incarceration hastened his death. His brother Robert George succeeded him, and was a stout supporter of the House of Stuart, refusing to allow William III. to enter this dwelling. The estate was purchased by the Halseys, and then by Thomas Penn, second son of William Penn, the founder of Pennsylvania. Across the park might be seen a large mansion, built in 1789 by John Penn, the son of Thomas. The architect of the house was Wyatt, the arch-destroyer of our cathedrals, whose handiwork could be traced in many a noble building, and whose vandalism all antiquarians and architects had continually to mourn.

Two other literary characters were connected with this historic village. Lord Chesterfield lived at Baylis House, built by Dr. Godolphin, provost of Eton in 1695. It is now a Roman Catholic school. There Lord Chesterfield wrote some of his famous "Letters to his Son," which display such studied relaxation of all principle, although marked by scholarship and style. Happily the son did not live long enough to carry out the instructions of his unworthy sire, and his death embittered the few remaining years of Lord Chesterfield's life with an ever-enduring despondency. George Grote, the historian, once lived at Stoke Place.

Then we have in this small parish some literary associations which are indeed remarkable. But our chief thoughts to-day will be concerned with the memory of Thomas Gray. You have seen the vault in which his body lies, the inscription placed by him on his mother's tomb, and the few lines that record his name; but his real memorial is that sad and touching poem wherein he describes his reflections on the short and simple annals of the poor and on this quiet and remote God's acre:—

Where heaves the turf in many a mould'ring heap
Each in his narrow cell for ever laid
The rude forefathers of the hamlet sleep.

And he sleeps with them

Who gave to Mis'ry all he had, a tear
And gained from Heaven ('twas all he wish'd) a friend.

FRESCOES IN HOUSES OF PARLIAMENT.

A MEMORANDUM on frescoes in the Houses of Parliament has appeared. The First Commissioner of Works has prefixed to it the following note:—

After an interval of eight years Professor Church has favoured me with a further memorandum, the eighth of the series, and in continuation of Paper C. 8893 (1898), giving details of the progress of his work in connection with the care of various works of art in the Houses of Parliament, and copies of the document are herewith laid before Parliament.

The gravity of the danger mentioned in the concluding paragraph of the memorandum has not escaped the attention of the Board, and among other steps taken to deal with the evils arising from the products of combustion, a memorandum, Paper C. 2930 (1906) has been brought to the notice of Parliament.

During the present year arrangements have been made for the examination and treatment of the frescoes under glass in the Peers' and the Commons' corridors.

I am glad to take the present opportunity of endorsing all that has been said by my predecessors as to the skill and ability which Professor Church has bestowed upon the work of preserving these paintings from decay. He has ungrudgingly devoted much time and labour quite gratuitously to the task, and His Majesty's Government is under great obligations to him in the matter.—L. HARCOURT.

July 26, 1906.

Professor Church has sent the following explanatory note:—

Shelsley, Kew Gardens: December 1905.

Sir,—Eight years had passed since any of the wall-paintings in the Palace of Westminster had been cleaned and repaired when, in October last, the work was resumed under my direction. The five true frescoes by the late W. Dyce, R.A., in the King's Robing-Room were sub-

jected to a treatment similar to that adopted in 1897, and fully described in the annexed Memorandum (VIII.), which continues the series to be found in the Parliamentary papers, C. 7651 (1895); C. 805A (1896); C. 8893 (1898).

After the work in the King's Robing-Room was completed I directed Mr. Redhead to deal with one of the central features in Maclise's "Wellington," the great water-glass painting on the south wall of the Royal Gallery. The light grey patches on the charger on which the duke is mounted had again become unpleasantly conspicuous since the last cleansing of the surface in 1897. Some slight touches of colour and the application of a little diluted spirit-fresco medium have greatly improved this important part of the painting.

Although I remain of the opinion expressed in 1897 that four of the paintings in the Peers' and Commons' corridors need attention, I now confine myself to the recommendation that during the late summer of 1906 the frescoes in the House of Peers should be again cleaned and repaired under my guidance, ten years having elapsed since they were treated.

I must renew my acknowledgment of the scrupulous care and marked skill which Mr. Redhead, of the firm of Shrigley & Hunt, has again shown in carrying out my instructions.—Yours faithfully,

(Signed) A. H. CHURCH.

To the First Commissioner of Works, &c.

MEMORANDUM VIII.

CONCERNING THE WALL-PAINTINGS IN THE PALACE OF WESTMINSTER.

The King's Robing-Room.

Although the history, condition and treatment down to the close of the year 1897 have been discussed in Memorandum III. (C. 7651, 1895), and again in Memorandum VII. (C. 8893, 1898), it seems expedient to repeat in the present report the chief data previously recorded.

Of the five wall-paintings in this room—all executed by the late Mr. W. Dyce, R.A.—four were completed between the years 1851 and 1854, while the fifth picture, the largest of the series, was not finished until ten years later. The central panel of the west wall, representing "Religion, the Vision of Sir Perceval," is the earliest of the set. Like all the others it is 11 feet 2½ inches in height, but 14 feet 6 inches in breadth. In the year 1868 the late Mr. Charles West Cope, R.A., repaired this picture, cutting out the decayed parts and cleaning the surface with bread. Moreover he repainted some of the heads and hands of the figures in water-glass and the smaller defects in tempera, coated the whole with parchment-size, and finally treated it with a solution of paraffin-wax in benzol. The two side panels, "Courtesy, or Sir Tristram," which is 5 feet 10½ inches wide, and "Generosity, or King Arthur Spared," 5 feet 9¾ inches wide, were treated in exactly the same manner. The two panels of the north wall, respectively 22 feet and 10 feet 2½ inches wide, being in a much sounder condition, needed no repainting; both, however, received a coating of the paraffin solution, the smaller picture having been sized as well. So much as regards the treatment carried out by Mr. Cope in 1868.

Now I may recall the nature of the operations which I conducted in October and November 1894. All the frescoes were cleaned with bread, some with distilled water as well. Places where the paint had peeled off were touched up with tempera colours, while the weak areas of the ground or of the original paint received several applications of a solution of paraffin wax in toluol to which had been added a small proportion of copal varnish free from lead. This medium, which closely resembles that of spirit-fresco, was found to be particularly useful, not only in strengthening the rotten part of the plaster ground, but also in rendering less conspicuous the grey film which obscured many parts of the paintings and which no mechanical treatment proved competent to remove. As all the paintings now being considered had already been paraffined, the similar treatment which I adopted in 1894 was, in point of fact, the only one open to me.

It is time to consider the work carried out in October of the present year. Before doing so I should like to refer to the words of my brief Memorandum (VII.) of December 14, 1897. Three years had passed since the frescoes in question had been touched, but they had "hardly deteriorated at all. The surface was cleansed with bread, a few necessary but quite insignificant touches were given, and the same preservative solution as before was applied, the application being repeated twice or thrice on those places where

the ground or the pigment was friable. With reference to the future treatment of these paintings, I recommend that they should be cleansed, and, if necessary, paraffined at intervals of three or four years. I believe that by continual care and attention they may be maintained for a long time pretty nearly in their present condition."

My attention having been called by an officer of the Board to some conspicuous white patches in the fresco of "Courtesy," I undertook, in September 1904, to examine the condition of this picture and to effect personally all such repairs as were immediately necessary. The complete treatment of this panel was deferred until after the close of the Parliamentary session in 1905. It was soon found that the upper part of the panel, including especially the foliage of the tree and the hair of the figures, required many repairs and a good deal of repainting. A few patches due to the exposure of the white ground occurred also in the lower half of this fresco; these were similarly dealt with, the pigments which were scaling off being secured, so far as possible, by the application of diluted spirit-fresco medium, no paint except what was absolutely necessary being added. These repairs and repaints were begun on the morning of Monday, September 19, and completed on the 22nd of the same month, 1904. Rather more than twelve months afterwards Mr. Redhead, with an assistant, both employes of Messrs. Shrigley & Hunt, of Lancaster, began their treatment of the frescoes in the King's Robing-Room by dealing with this panel "Courtesy." It was found that my work of the preceding year remained firm and sound, but that the parts which I had neither cleaned nor restored required attention. Consequently the whole picture was carefully cleansed with bread-crumbs, a few slight repairs and repaints executed, and the entire surface treated with diluted spirit-fresco medium until all tender places in the ground or in the pigment had been made secure. Here it may be mentioned that the weakest places in the plaster-ground of this picture and of the other wall-paintings in this room were strengthened by the application of a mixture of which ceresin (a kind of paraffin) was the chief ingredient. Two ounces of a hard ceresin (with a melting-point of 156 deg. Fahr.) were melted and then thoroughly mixed with half an ounce of oil of spike lavender and five ounces of toluol—both of these liquids being measured, not weighed. The mixture was warmed till complete solution ensued; on cooling it forms a soft ointment-like paste which admits of being spread upon any surface by means of a brush or palette-knife. When, after the lapse of an hour or two, the toluol has evaporated, a spirit flame or smokeless gas-jet is brought near the treated surface, the residual ceresin melts and is driven into the soft or decayed plaster or paint.

Directly this is done, repainting may be commenced upon the plaster, which will be found to be hardened and to be capable of firmly retaining fresh pigment.

Besides the defects already noted in this picture it showed, as did most of the other paintings of the series, certain areas of discoloration. These occurred mainly in the lighter parts of the draperies, and being yellowish or foxy in hue were particularly conspicuous and disfiguring on the blue and cool colours of some of the robes. On a previous occasion I contented myself with the temporary expedient of concealing the discordant patches by means of a few touches of pastel or coloured chalk. But during the recent operations, after bread-crumbs, spirits of wine and peroxide of hydrogen had been tried with very partial success, the discoloured patches were covered up by the application of the smallest possible amount of fresh colour mingled with spirit-fresco medium.

Next to the panel "Courtesy" comes the large picture "Religion." The upper part of this work, especially on the (spectator's) left, was found to need much attention, the ground and pigments in several places being in a friable state. The robe of the female figure on the right exhibited the yellowish discoloration previously mentioned. In all respects this fresco received the same treatment as the "Courtesy."

The small panel "Generosity" next to the door of the room had shown a few conspicuous weak places when examined by me in September 1904. At that time I had touched with colour some white spots in the figure of King Arthur, but the picture required further repairs and a thorough cleansing with bread during the recent operations. It was treated in the same way as the other panels on this west wall.

The defects in the large fresco on the north wall occurred mainly in that part of the painting which extends from the

spectator's left to the centre, while the upper and the lower birds of the panel were fairly sound. Much dirt, however, had to be removed from the whole surface. The robe of the central female figure afforded another instance of the partial yellowish discoloration before mentioned; it consequently received some delicate touches of fresh colour, as did also the lower part of the jerkin of the standing figure on the extreme left of the foreground.

One more panel, "Mercy," remains for discussion. This picture showed weak places on either side of the two window openings represented near the top, in the lowest part of the figure on the extreme right, in the lowest central area and in the upper parts of the two figures near the extreme right. The skirt of the stooping figure which occupies the most prominent position in the left centre of the picture, although quite sound and firm, needed in some parts slight additions of colour to conceal patches of discoloration.

The operations on these wall-paintings in the King's Robing-Room were begun on Monday, October 2, and were completed on Saturday, October 28. Between these dates I paid seventeen visits to the room to control and watch the progress of the work.

The three small photographs* ("Courtesy," "Hospitality" and "Mercy") annexed to the present memorandum were taken before the recent operations; they have been so marked as to show the chief defective areas of each picture. Large photographs on a scale varying from 1-14 to 1-24 of the dimensions of the original paintings were taken on November 7, 1905. They comprise the whole series of five, and constitute a record of the condition of these frescoes just after their recent restoration.

The advisability of cleaning and repairing these and the other wall-paintings in the Palace of Westminster at intervals of three or four years has become more evident to me than ever before after my recent experience. The increased and increasing consumption of coal in London and the greater license allowed to the gas companies in the matter of freeing their gas from sulphur compounds, must result in a serious augmentation of the amount of sulphuric acid in the air of the Metropolis. This acid it is which constitutes the chief destructive agency at work on pictorial and other artistic productions.

Shelsley, Kew Gardens: December 11, 1905.

CONCERNING BRICKS AND BRICKWORK.

THE material commonly employed for building throughout Eastern countries is mud brick. In rainless Egypt this is a perfect substance for walls, and the great defences of towns and sanctuaries were immensely massive walls of dried mud up to 80 feet in thickness. In Babylonia as wide a use of mud brick is found, walls, ramparts, &c., being entirely made of it. In Palestine mud brick was largely used in Amorite times and it was employed for thick fortifications. The form was more like the Babylonian, being a square tile, whereas the Egyptians used a brick of our present shape. Throughout the Jewish period mud brick was generally used, faced with stone jambs and lintels at the doorways and plastered white all over. Such was the Egyptian method.

Brick-making in Egypt was a common occupation for captives. The black Nile soil of the country was dug down into a hole near water, mixed with sufficient sand and chopped straw. It was trampled into a paste, which was placed into a wooden mould and pressed down, the mould lifted and the brick left to dry, the frame placed close to it, another brick moulded, and so on, until the ground was covered with bricks in regular rows.

Straw was not by any means universally used; often plain mud and sand, or mud and pebbles. It was far more important to get the tale of bricks than to be too particular about the straw. Straw was valuable cattle food, and the main support of animals during the inundations, as it is more sweet and grassy than English straw; hence stubble was quite customary, and many more bricks are to be seen made with waste than those containing good food.

Bricks of Nineveh.

Botta, in the narrative of his researches at Nineveh, states "that all that exists of the ruins of the ancient city, boundary walls and mounds, is formed of bricks which were merely baked in the sun; these bricks have been re-

* These photographs have not been reproduced.

duced by age into an earthy state, and consequently cannot be used again." There can be no doubt but that in the construction of buildings kiln-burnt bricks were sometimes employed, but the mass of the walls was composed of unburnt bricks.

The inhabitants, on learning that Botta was in quest of stones bearing inscriptions, in 1842, at Khorsabad, two large bricks with cuneiform inscriptions were brought to him which had been found near the village. The man offered to procure him as many more as he wished. This man was a dyer, and built his oven of the bricks obtained from the mound on which the village was built; this led to the discovery of an immense monument. Excavations showed a mass of bricks baked in the sun and placed in regular layers. These bricks, unlike those baked in kilns, bear no inscriptions, nor are there any signs of chopped straw visible in their composition; the layers are nowhere separated, nor are they united by any cement, either bituminous or calcareous; the bricks seem to be united merely with the same clay which was used to make them.

Painted Bricks.

In Ezekiel xxiii. 14, 15, we read:—"She saw men portrayed upon the wall, the images of the Chaldeans portrayed with vermillion, girded with girdles upon their loins, exceeding in dyed attire upon their heads, all of them princes to look to, after the manner of the Babylonians of Chaldea, the land of their nativity." This remarkable piece of evidence, added to the traces of colour still subsisting, proves without doubt that the Assyrians were accustomed to paint their bas-reliefs. On the sculptures of Khorsabad the colours found were red, blue and black, but on the bricks there are other tints than red, blue and black, such as yellow, white, green, &c., and there is no reason why the Assyrians should have used these later colours on their bricks, and not have employed them to paint their sculptures. In noticing the mode of building pursued at Khorsabad, Bonomi says it was evident that above the coating of gypsum slabs there had been several rows of kiln-burnt bricks, the united surface of which must have represented subjects analogous to those which were sculptured on the lower part of the wall.

Prehistoric Brickwork.

The Seille is a little river at Metz in Germany, which swiftly rushes round some of the stupendous walls and gates of that town. It springs from a small lake not far from the little town of Dieuze, which lies a short distance to the north of Avricourt, and it flows on through a valley oftentimes marshy but fertile. Five Roman villas have been discovered there in a distance of 12 miles, but what appeared no less remarkable were the immense masses of brickwork thrown into the marshes to create a solid foundation. These bricks or tiles, to which the name of "briquetage" has been given, are of various forms, size and colour. The different degrees of baking have given to some colours varying from clayey brown to bright red, while time and the marshy soil have imparted to others a green or black coating. Some bear the impress of the hands of their maker—the marks of the fingers—and upon some are even the markings of the skin. Others have a rough surface, as though from the straw upon which they were probably laid before baking.

These curious bricks differ in size, form and colour; the largest vary from 10 to 30 centimetres long and 3 to 7 centimetres thick. The smallest may be compared to the bones of the finger, and many are extremely small. All these morsels, great and small, have been kneaded and moulded by the hand, baked, and then thrown pell-mell into the marsh, without order or arrangement, exactly as we now throw stones to form foundations for breakwaters. The bricks thus thrown together, without any cement, now form a substance so hard that it is difficult to separate the parts with a pick-axe.

At Marsal this kind of substructure covers the whole of the site of the town and nearly the whole of the fortifications; towards the west it stretches beyond them for nearly a thousand feet. The question arises, Who laid down this foundation and at what period in the world's history? The fact that beneath the "briquetage" no traces of Celtic or Roman remains have been discovered, whilst above it numerous relics of both races are frequent, goes to support the theory that this brickwork is to be ascribed to the primitive inhabitants of the district, and that it was executed for two purposes, viz. foundations, and for the formation of salines for the manufacture of salt. Works are about to be carried out in the valley of the Upper Seille which may yield proofs of the antiquity and uses of this strange work.

Stock Bricks and Place Bricks.

In a paper read before the Architectural Association of Ireland on "Architectural Customs Two Hundred Years Ago," by Mr. T. E. Hudman, the author gives the following explanation of the origin of the terms "stock brick" and "place brick":—"You will notice that I have mentioned stock bricks and place bricks were by law to be kept distinctly separate in the kiln. This seemed to me peculiar, because nowadays we understand place bricks to be a soft and defective stock brick. After searching I discovered the meaning of it. Stock bricks and place bricks were in the days of King George I. two distinct classes of brick made in different ways and of different clays. The stock bricks were made of a stiff marly clay and on a board called a stock, which gave it its name; the place brick was made of a softer clay, and being much more delicate to handle and dry, it was necessary to prepare a place close to the moulding-board to place the bricks upon to dry and prevent their being damaged by too long carriage or much handling, and for this reason they were called place bricks."

Taxes on Bricks.

The *Spectator*, in a recent article by Sir William Laird Clowes on a manuscript diary kept at one time by a secretary of the East India Company, remarks with regard to an evasion of taxation on certain articles, that "there was a tax on bricks, but the size of the brick was not specified. The result was that the builders used bricks of huge proportions, and the lower walls of the cellars of some of the houses on the south side of Brunswick Square are constructed of these larger bricks. The upper walls, built after the tax had been taken off, are of the ordinary dimensions." This is inaccurate; it was not till the close of the eighteenth century that bricks were subject to taxation.

By the Act 24 George III. c. 21, a duty of 2s. 6d. a thousand was imposed upon bricks. By 43 George III. c. 29 bricks were divided for fiscal purposes into common and dressed bricks, and separate rates of duty were imposed on each kind. These duties were as follows:—"For every thousand bricks which shall be made in Great Britain, not exceeding any of the following dimensions, that is to say, 10 inches long, 3 inches thick and 5 inches wide, 5s.; for every thousand bricks which shall be made in Great Britain exceeding any of the foregoing dimensions, 10s." The duty on the larger brick was double that imposed upon the ordinary kind. By 3 William IV. c. 11, the duty on tiles was wholly repealed, and the duty on common bricks was raised to 5s. 10d. per thousand. The duty on bricks was removed in 1850.

Dated Brick.

In March, 1896, the White Hart Hotel, Romford, was pulled down for the purpose of rebuilding; a brick was found with the date 1602 upon it. This had not been cut upon a burnt brick, as is frequently done when bricks are laid as memorials, but it had evidently been inscribed when the clay was in a moist state and had afterwards been burnt.

According to Mr. St. John Tyrwhitt, Roman bricks are often historical documents, on which dates and questions and other issues may depend. Every tetradoron or pentadoron had its date and the mark of its maker down to the time of Justinian. The monogram of Our Lord is often found on bricks used in church building. For secular architecture the names of the consuls or emperors were used. We have seen how this settles a really interesting question of date in the Catacombs. A German scholar, Mr. P. G. Weiner, has traced the Twenty-second Legion in its movements through a great part of Germany by the bricks which bear its name; and Roman bricks have been found among the Silures, our friends of Shropshire and the Welsh Marches, with the inscription "Leg. II. A.V.G." stamped upon them.

The first matter on which letters were received was stone and bricks, whence Josephus tells us of the pillars of stone and brick. Pliny remarks that the Babylonians preserved their customs, laws and institutes on bricks; the Phœnicians on stone.

Size of Bricks.

By 27 George III. c. 27 the size of bricks was not to be less than 8½ inches by 2½ by 4 inches. The preamble to this Act recites "that the laws heretofore made for regulating the dimensions of brick for sale have expired." The Order of Charles I. first fixed the size of bricks.

The following entry occurs in the churchwardens' accounts of St. Giles, Reading, under the date of 1519:—"Paid for brykes, breke batts, lyme ed sand for a reredosse

ed a Oryn, for workmanship of the same vij'." A brick-bat strictly is a portion of a brick with one end entire, and less than half the length of a brick; but in popular language, and most particularly when a brick-bat is used as a missile, the term seems to be employed for almost any fragment of one.

Brickwork in Bond.

In Manchester in the last century, as may be seen by examination of dates attached to old buildings in Marsden Square, St. James's Square, Cannon Street, &c., the buildings were formed by laying the first course with whole bricks; the next course the bricks are cut across for the outside brick, and the remainder filled with bricks laid at random. The third course as first, and so on. The walls are generally three to four bricks in breadth thick.

Sussex Brickmaking Terms.

Breeze.—French brasier, coarse ashes or cinders.

Clamp.—A collection of dried bricks, arranged for burning.

Crowd.—To place bricks in a clamp.

Frog.—The raised part of a brick mould, which forms the hollow of the brick.

Hack.—A flat bank or ridge of earth on which bricks are placed for drying.

Lew.—A species of wattle formed of faggots and straw, and placed at the sides of the hacks to shelter unburnt bricks.

Lew Rods.—Those used in making lews.

Off-bearing.—Carrying bricks from the moulder to the hacks.

Pug.—Soft clay mixed with soil, from which the bricks are moulded.

Pug Mill.—A mill for grinding and mixing clay and soil.

Skinlle.—To shift bricks edgewise when in the clamp to complete drying.

Soil.—The finer ashes sifted out from the breeze and mixed with clay for making bricks.

Bricks and Sand.

Bricks, when shaped, are wheeled away to the drying ground, and are piled on one another in long rows about 3 feet high, so arranged that the air may pass freely among them, and protected from the rain by a roofing of tarred wood—tarred because black attracts the heat. During the drying process many bricks crack and so are rendered useless, a strong wind being as destructive to them as excessive and unequal heat. With regard to cracking, very much depends upon the nature of the material. In some parts of the country the bricks can be carried almost straight to the kiln, while in others they require to be dried for a long time, and even then are not to be relied on.

In order to counteract this destructive tendency a fine yellow sand is often mixed with the clay, always, we believe, in the case of hand-made bricks. This not only imparts firmness and strength, but also gives the bright red colour which builders are so fond of. A story is told of the owner of a large brickfield who was fortunate enough to have both sand and clay on his property, and so turned out excellent wares. Anxious to become rich in a hurry he sold all the sand and devoted himself to making bricks with clay alone, but found to his mortification that they were so rotten as to be unsaleable.

MYSTERIOUS LAW CASES.

ON Saturday last Mr. Justice Walton, in the King's Bench Division, gave judgment in two cases which had been tried before him at the last Leicester Assizes.

His Lordship said in one case Mr. James Chapman sued Mr. John Henry Burley for 465*l.* 13*s.* 9*d.*, the balance due under a contract for certain building work. The plaintiff was a contractor and the defendant the building owner. The main defence was that plaintiff had been paid for the work, and had given receipts for various sums so received. The case was a very remarkable one. The owner's architect was a Mr. Goodacre, and he acted for Mr. Burley in and about the negotiations for the execution of the contract, and also in carrying out the work. The contract was signed on March 27, 1903, and by it the contractor agreed to build on land belonging to Mr. Burley in High Street and Carts Lane, Leicester, five shops for 3,990*l.* The plaintiff was a bricklayer, and the only part of the work he was going to execute was the bricklaying work, which came to a little less than 800*l.* The other work was to be done by sub-contractors. The plaintiff signed the contract, and with regard to the other tradesmen, as far as his Lordship could

make out, Mr. Chapman left the arrangements to be made with them by Mr. Goodacre, in whom he had considerable confidence, as had Mr. Burley also. According to the contract, unless the architect decided otherwise, the contractor was not entitled to call upon the building owner for any payment on account until the value of the work executed amounted to 650*l.* The work began at once, and very strange things happened. On May 8 the architect, without any request from Mr. Chapman or anybody, certified that the sum of 500*l.* was due to Mr. Chapman on account of work executed and materials supplied in the construction of the shops. This was submitted to Mr. Burley, not by Mr. Chapman—he knew nothing whatever about it—but one must presume by the architect, Mr. Goodacre. Mr. Burley, upon that certificate, drew a cheque for 500*l.* in favour of and payable to James Chapman on order. That cheque was never handed to Mr. Chapman, and was never endorsed by him. It was endorsed with his name, but such endorsement was a forgery. Moreover, the name of Mr. Chapman was forged to the receipt on the lower part of the certificate. The same thing happened again on June 11, when another certificate for 500*l.* signed by Mr. Goodacre was presented, and another cheque drawn by Mr. Burley payable to Mr. James Chapman on order. The name of Mr. Chapman was again forged. The same thing happened on July 25, the amount of the certificate in that case being 750*l.*, and the cheque drawn for the amount. So that up to July 25 Mr. Burley had paid 1,750*l.* by cheques drawn in favour of Mr. Chapman, and upon certificates signed by Mr. Goodacre. Of these payments, certificates and cheques plaintiff knew nothing at all. Indeed, up to that time the value of the work executed had not amounted to 650*l.* On August 15 the value of the work executed was about 600*l.*, and on that date Mr. Chapman applied for payment and asked for a certificate. Mr. Goodacre gave him a cheque for 200*l.* Mr. Chapman said that would not go very far among all the people engaged on the work, and Mr. Goodacre replied that was for him, he (Mr. Goodacre) would pay the others. Mr. Chapman received the 200*l.*, and was willing that the payments to the sub-contractors should be made direct to them by Mr. Goodacre, and he assumed that was being done. Meantime the forgeries continued. While Mr. Goodacre was, in fact, paying comparatively small sums to Mr. Chapman and some of the other tradesmen, he was certifying for large amounts, and receiving the cheques just in the same way. Up to August 9 he had obtained in that way from Mr. Burley 2,300*l.*, and a further sum of 320*l.* 3*s.* 4*d.* Of these forgeries Mr. Chapman knew nothing at any time material for the purposes of the present action. The result was that the defendant, Mr. Burley, had in fact paid his architect, Mr. Goodacre, for the whole of the work upon certificates given by him by cheques that never reached Mr. Chapman, although intended for him, and on receipts never signed by Mr. Chapman, though purporting to be so signed. Mr. Chapman and the other tradesmen had received various sums amounting altogether to 2,691*l.* 7*s.* 1*d.*, and according to plaintiff's account the total amount payable in respect of the work was 3,167*l.* 4*s.* 10*d.*, leaving the balance now sued for. The question which he (the learned Judge) had to decide was whether Mr. Chapman was bound by the payments which had been made by Mr. Burley to Mr. Goodacre. In other words, it came to this, Was Mr. Goodacre Mr. Chapman's agent to receive payment, or had Mr. Chapman acted in such a way that he was estopped from denying that the payments to Mr. Goodacre were payments to him? Upon the contract itself Mr. Goodacre undoubtedly was not the agent of Mr. Chapman to receive payment. It was clear that Mr. Burley intended the payments to Mr. Goodacre, not as the agent for Mr. Chapman, but to Chapman direct, the cheques being made payable to Mr. Chapman's order. This was one of those unfortunate cases in which a loss owing to the fraudulent conduct of a third person must fall on one of two innocent parties, and it was no doubt a hard case which ever way it was decided. But he thought the only conclusion he could arrive at was that there was no reason for throwing the loss on Mr. Chapman. The money had not been paid to Mr. Chapman, and he was entitled to sue for whatever was properly due for the work done.

The question of how judgment should be entered, the matter of costs and other points stood over for further consideration on October 24.

Mr. Justice Walton said the case *Pretty v. Worthington* was in a sense somewhat connected with the one he had just decided. It was a claim by Mr. Pretty, who was a painter, of Leicester, against Messrs. Worthington & Co.,

Ltd., to recover 103*l.* 12*s.* 9*d.*, which he said was due to him for certain painting work done on premises belonging to the defendants, the Albert Hotel, by their order. The order was given by Mr. Goodacre, the architect. What happened might be stated quite shortly. Mr. Goodacre applied to Mr. Pretty to send in a tender for painting the hotel which was about to be rebuilt. He sent in his tender for 82*l.* 5*s.* 8*d.* This was accepted by Mr. Goodacre, and the work was done. There was extra work amounting to 21*l.* 7*s.* 1*d.*, which, together, made up the claim. The defence was that Messrs. Worthington never ordered the work at all, that there had been no contract between them, and Mr. Pretty was introduced by Mr. Chapman. Mr. Chapman contracted for rebuilding the hotel, the total amount of the contract being 4,239*l.* Of this sum Mr. Chapman contracted for 1,175*l.* for bricklaying and 800*l.* for joiner's work. As to the remaining work, amounting to 2,150*l.*, to use the peculiar language of the quantities, "the work and materials were to be selected by the architect." That was not an uncommon form of arrangement in the Leicester district. He found that Messrs. Worthington accepted that. They must be taken to know all about the contract, and by it the painting work was to be selected by the architect. He was quite satisfied that the terms of the contract and the quantities gave ample authority to the architect to give the order which was given in this case. Therefore plaintiff was entitled to recover, and he gave judgment for him for the amount claimed, with costs.

The New County Hall, London.

SIR,—Should the present decision of the London County Council stand, a great wrong will be done to the overtaxed professional ratepayers of this great city. Why should the London County Council authorities go beyond London architects? Surely the members of the profession in London are capable of designing a worthy home for this important body. The pages of your Journal from week to week serve to show the feeling in other cities and towns, when we read "only architects practising in — (town or county) will be eligible to compete." Why, therefore, should the London County Council authorities go outside their own area? I would suggest that, in common justice to the architect ratepayers of the Metropolis, their present decision as announced should be reconsidered.—I am, yours truly,
F.R.I.B.A.

Nothing Like Free Trade.

SIR,—Hooray for Free Trade! nothing like it. The London County Council, bless them all, won't have Protection; certainly not. Hooray! Our German, French and Italian, to say nothing of dear Cousin Jonathan, architects are quite as good at architecture as we are, so let them all have a go for our new Council House. (Dear me, I nearly put Asylum.) Why not? Here you are, this is a brilliant suggestion. Why not give it to them entirely and leave out, yours truly,
A BRITISH ARCHITECT.

P.S.—A further brilliant idea. Why not employ a German architect, a French decorator, an Italian sculptor, and let Cousin Jonathan erect it and invite the President of the R.I.B.A. to open it?

The Motor-Car and Dust.

SIR,—To those residing on a main road the era of motor traction has become an intolerable nuisance. The noise, the smell, but, what is far more obnoxious, not to say dangerous, the dust, is beyond comprehension except by those who have to put up with it. There are many systems for dust-laying, I am informed, and surely one of these can be found to be successful; if not, then for health's sake alone the Government should be forced to take the matter up. I was talking to a prominent local doctor during the strawberry season, who informed me that he had never known so much illness from diarrhoea; this he put down to the fact of the dust and small particles of refuse which were blown about and caused by motor-cars passing the fruit fields. On the grounds of public health the matter should be promptly dealt with. Excuse my taking up your valuable space, but I know *The Architect* is taken by local authorities, and possibly my small effort might have some effect. Thanking you for publishing this letter, I am, yours truly,
BRIGHTON MAIN ROAD.

Street Noise Abatement.—Petition to the Home Secretary.

SIR,—The petition to the Home Secretary, requesting far more stringent regulations and restrictions concerning motor omnibuses and traction engines in the streets of the Metropolis, has been well started and bids fair to be one of the most influential petitions of modern times. The names of the principal signatories having been forwarded to the Home Secretary, I have pleasure in herewith enclosing a copy of the same. It is proposed to keep the petition open until the commencement of the autumn session.—I am, Sir, yours obediently,

THOS. BOWDEN GREEN,

Hon. Sec. Petition Committee.

2 Harrington Gardens, South Kensington, S.W. :

August 8, 1906.

GENERAL.

Mr. George Clausen, A.R.A., Mr. Frank Brangwyn, A.R.A., Mr. Walter Crane, R.W.S., and Mr. F. Derwent Wood will act as adjudicators in the competition for prizes that will be held this autumn by the members of the South Kensington Sketching Club (the Royal College of Art). Among the numerous extra prizes is one offered by Mr. T. G. Jackson, R.A., for the best design for a brass cased rim lock with finger plates, another by Professor W. R. Lethaby for the best piece of workmanship, designed and wrought by the same student, in any one of the artistic crafts, and one by Professor Beresford Pite.

The Sheldonian Theatre, Oxford, is being improved internally with a view to minimising the fire dangers. All the doors will be made to open outwards, and the wooden floors of the corridors running along the outside of the large hall are being taken away. They will be replaced by fireproof floors supported by iron girders. The four old approaches to the galleries have been pulled down, and staircases of modern design will be substituted for them.

The Société Artistique de Normandie have acquired for the permanent art collection in the Rouen Municipal Gallery an oil painting, *Winter*, by Mr. James Kay, R.S.W., Glasgow. The picture, which gives a glimpse of the Clyde on a bleak wintry day, was on exhibition at Rouen.

Mr. David Benzie, recently assistant resident engineer with the Aberdeen Corporation, has, after a stay of two months in Canada, been appointed city engineer in St. Catherine's, Ontario.

Mr. John Wills, architect, Derby, who died on June 20 last, left estate of the gross value of 15,975*l.*, of which the net personalty has been sworn at 6,355*l.*

The Section of Anthropology of the British Association at the final meeting of the general committee proposed that the Council of the Association be asked to impress upon the Government the desirability of appointing an inspector of ancient monuments fully qualified to perform the duties of his office, and with full powers under the Act for the preservation of ancient monuments, and with instructions to report periodically on his work with a view to publication.

Georges Haquette, the painter, died last week at Dieppe. His works, which were popularised by photography, were mostly marine subjects.

The Congress of the History of Art, which was to be held this year in Stockholm, has been postponed until next year.

The London County Council have introduced an explanatory brass plate in the restored room of Cardinal Wolsey's palace, 17 Fleet Street, which is now open free to the public. It bears the inscription:—"This house, of which this room forms a part, was built in the year 1610, and is, with the exception of Crosby Hall, probably the oldest house in the City of London. It is an almost unique specimen, of its kind, of the architecture of the period. Internally the chief interest in the building is centred in this room, the most noteworthy features of which are the moulded plaster ceiling and the oak panelling on the west side. The device in the centre of the ceiling refers to Henry, eldest son of James I., created Prince of Wales in the year in which the house was built. It seems probable that for some time the room was used as the council-chamber of the Duchy of Cornwall. In view of the interest attaching to the house, the London County Council, with the co-operation and assistance of the Corporation, purchased the building in the year 1900, when it was on the point of demolition, and restored the premises."

The Architect.

THE WEEK.

THERE is no difficulty in understanding why the information respecting the earthquake at Valparaiso and the loss of life and property which followed should be differently estimated. There can be no question, however, that both were on an astounding scale. Earthquakes so frequently occurred in recent times, both in Valparaiso and in neighbouring towns, the inhabitants could not have ignored the possibility of another catastrophe. The advantages offered by the situation were so profitable, the risks were accepted as if they resembled those of a commercial kind. ALEXANDER VON HUMBOLDT, who had lived for some years in that region studying earthquakes and other physical phenomena, found that the shocks followed the course of the shore and did not extend inland. He concluded that there was an intimate connection between the causes of earthquakes and volcanic eruptions. He considered that everything in earthquakes seems to indicate the action of elastic fluids seeking an outlet to diffuse themselves in the atmosphere. Often on the coasts of the Pacific the action, he found, was almost instantaneously communicated from Chili to the Gulf of Guayaquil, a distance of 600 leagues, and what was very remarkable, the shocks appeared to be the stronger in proportion as the country is distant from burning volcanoes. Whatever the cause, it is impossible for men to alter it. HUMBOLDT believed that if Chimborazo could be converted into a volcano there would be fewer disturbances in the region where it is found. He approved, therefore, of the Greek tradition that the shocks in the island of Eubœa totally ceased on the opening of a crevice in the Lelanon Plain. But nature alone can perform the works necessary for the relief of the Pacific coast.

THERE is no town in Ireland of equal size which possesses a larger number of ecclesiastical remains than Drogheda, co. Louth. A lofty tower, known as the Magdalen Tower, has survived. It is part of the Dominican abbey which was founded as far back as 1224 by LUCAS DE NETTERVILLE, Archbishop of Armagh. It was in that abbey that four Irish princes submitted to RICHARD II. in 1394. It was feared that the tower was likely to be destroyed and subscriptions were therefore obtained for enclosing the site with an iron railing. The work having been completed the tower was handed over to the Mayor and Corporation, who will, no doubt, secure its preservation. There is also the tower of the abbey of St. Mary, generally known as the Old Abbey, for it is believed that St. PATRICK founded it in the fifth century. The tower, although not so lofty as the Magdalen Tower, surmounts an archway which is used as a gateway.

THE costliness of arbitration and the risks incurred by contractors adopting it in preference to the ordinary proceedings in the Courts was exemplified in a bankruptcy case heard at Manchester. The bankrupt was a mining engineer and colliery manager. With his savings he was able to set up as an asphalter. He took a contract from Messrs. NAYLOR BROS. to lay asphalte and tar paving on eight bridges of the North-Eastern Railway. The contract amount was 900l. When about two-thirds of the work was executed one of the engineers varied the terms of the contract. At that time the bankrupt stated 470l. was due to him. He declined to complete the contract unless the original conditions were adhered to, and Messrs. NAYLOR had to carry out the work. The bankrupt's claim for 470l. was referred to arbitration, and after five days' hearing the arbitrator found that nothing was due from Messrs. NAYLOR. The bankrupt was ordered to pay 150l. to them,

with costs amounting to 420l. His own costs were 340l. In other words, there was a direct loss on his first contract of 1,350l. The Judge expressed his sympathy with the bankrupt, and granted his discharge, suspending it for the minimum period.

CHESTER at one time gained some renown by the performance of mystery plays, examples of which still exist. There is of late a desire to present scenes and pageants which will recall Mediæval life. It is therefore proposed to revive the performances of several of the Chester plays. The Archdeacon in supporting the project says:—"We are in a better position in this respect than those towns which have been reviving the memories of their past history by the production of pageants, for we have not to decide what scenes shall be represented, nor to supply words for the actors. We have the old plays themselves, which, with the needful revision, will furnish all the material that is necessary. The secretary of the English Drama Society promises that in treatment of costume and detail the Mediæval character of the plays will be preserved with the greatest care." The English Drama Society made the experiment of attempting three of the plays, and they met with a favourable reception. It is proposed to revive the whole series, which could be done in three days. The Chester Archæological Society consider the attempt as desirable. The necessary subscriptions would, no doubt, be forthcoming. So large a part of Chester has not been modernised, the performances would have an environment which could not be so well obtained in other places.

An inquiry which has been held by an inspector of the Local Government Board at Kinsale, co. Cork, throws some light on the question of labourers' cottages in Ireland. Many of the so-called labourers in that locality are fishermen who are rather brave, for they constantly venture their lives in very frail boats. The Council had already erected some cottages at the small sum of from 80l. to 90l. each. But the price of materials and labour having increased the average cost became 140l. It is now proposed to erect 105 cottages, each having an acre of ground attached. The estimated cost is nearly 240l. each, or about 70l. per house beyond the average stated by the Irish Secretary when introducing the new Labourers Act. It is proposed to borrow 25,000l., being at the rate of 235l. per cottage, at 3½ per cent. It is not to be supposed that superior materials and workmanship will be employed in the Kinsale cottages, yet the cost of erecting them is largely beyond the sum which imaginative people assign for the erection of cottages in England.

THE Glasgow School of Architecture, which is connected with the Technical College and the School of Art, offers an extensive programme for the coming session. The more technical side of the subject is treated in one division and the more strictly artistic in the other. Thus, in the School of Art there are classes for architectural design, drawing and painting from the life and from the antique, ornament, modelling and decorative design. In the Technical College instruction is given in history of architecture, architectural construction, mathematics, descriptive geometry, mechanics, mechanics of structures, natural philosophy, chemistry, geology. Some of the classes open on September 6, others on September 25. The fees for a diploma course are 10 guineas per annum for day classes and 2 guineas for evening classes. This course is particularly recommended by the Glasgow Institute of Architects. In the School of Art the subjects are remarkable, and comprise practical applications of art, including metalwork, enamels, printing in colours, lithography, house decoration, stained glass, stone-carving, &c. During the last session there were 136 architectural students attending the school.

THE ARC DE L'ETOILE: A CENTENARY.

AT the beginning of the year 1806 NAPOLEON could be considered as having attained the foremost position in Europe. He was not only Emperor of the French, but in the preceding year he was crowned King of Italy at Milan. In December 1805 he gained the great battle of Austerlitz. He had arranged for one brother to be King of the two Sicilies, another to be King of Holland, a third was to be King of Westphalia, and a fourth of Spain. He therefore was justified in assuming that he was the king of kings, and that the dynasty he founded would endure. As his arch-enemy, WILLIAM PITT, died on January 23, the year 1806 appeared destined to advance his triumphs.

Great as were his faults or crimes, it must be admitted that the son of the Corsican advocate was able to value architecture as if he belonged to one of the families of the CÆSARS. He was not satisfied with trusting to historians to record his victories. He desired to have also memorials in marble and bronze. It had been already arranged that a triumphal arch was to be raised on the Place du Carrousel in order to perpetuate the glory of the French armies. The platform was to have a quadriga by a French sculptor, to which were to be attached the four horses which originally adorned the Temple of the Sun at Corinth, but which afterwards were transported to Constantinople and then to Venice, from which city they were taken as spoils of war. NAPOLEON was, however, eager to have a still more imposing triumphal arch. He obtained designs from CHALGRIN for one which was to be set up on the boundary of Italy. Afterwards NAPOLEON contemplated its erection on the site whereon the Bastille stood before the Revolution, and to have it known as the Arc de Marengo. On February 18, 1806, it was decided to place the great work at the western extremity of the Champs Elysées, where the junction of different roads had made a *rond point* or *étoile*. It is needless to say that once the project assumed definiteness a great many architects sent in designs, and in consequence there was unusual delay in commencing operations, owing to the difficulty of discovering which of them was the best. Finally CHALGRIN was directed to prepare new designs in co-operation with RAYMOND. After a couple of years the latter retired, and the whole credit of the work is therefore accorded to CHALGRIN. He, however, died in 1811, and the carrying out of his designs devolved on other architects.

Work at the foundations was commenced in May 1806, although it is believed the plans were not at the time completed. The foundations extend to a depth of 25 feet beneath the soil and over an area of 56 metres by 28 metres. By another decree the Emperor had ordered that his birthday, August 15, which, according to the calendar, was the feast of the Assumption of the Blessed Virgin, was henceforth to be celebrated as the Feast of St. NAPOLEON and as the anniversary of the conclusion of the Concordat. It is right to say there was a martyr of the name of NAPOLEON who suffered under DIOCLETIAN. But his name did not reappear until 1803, when it supplanted that of St. ROCH in the almanacks. It may have been thought at the time that the Concordat would outlast the triumphal arch. But while the arch remains unaffected by time the Concordat has ceased to be recognised. It was anticipated that at the first celebration of the Feast the Emperor would have laid the foundation-stone of the great memorial. The Emperor and JOSEPHINE showed themselves in the Champs Elysées on that day, but it is not recorded that they made any stoppage at the site of the arch. The workmen, however, had cut a stone in the form of an hexagon, which they placed in the middle of the masonry already laid, with an inscription stating that it was the first stone which had been placed in the foundation of the monument.

The works proceeded slowly. This was partly owing

to a difference of opinion between the architects about the form which the superstructure should assume. CHALGRIN wished to introduce plain piers which would allow of sculptural decoration on a large scale. RAYMOND desired to have a columnar arrangement instead, and he was able to obtain the support of several architects. RAYMOND at length resigned, and CHALGRIN therefore obtained the whole control of the design. In 1810, four years after the works were undertaken, he was able to publish a series of engravings of the arch as it was to appear when completed. When the Emperor brought his new wife, MARIE LOUISE, to Paris, they passed beneath a full-sized imitation of the structure, which was formed of canvas and timber. CHALGRIN did not long continue the direction of the works, for he died, as we have already said, in 1811.

The Arc de Triomphe in the Place du Carrousel was advanced far more expeditiously than the larger work. The architects, FONTAINE and PERCIER, took the Arch of SEPTIMIUS SEVERUS as their model, and no time was therefore lost in debates over the design. Probably the war in Spain and other enterprises prevented sufficient funds from being assigned for the Arc de l'Etoile. GOUTY conducted the works for two or three years, and then in 1814 they had to be suspended. France was at bay, and every franc was required for the final struggle. After Waterloo many Englishmen visited Paris, but in the numerous accounts which were published no attention was given to the incomplete structure in the Champs Elysées. Sir WALTER SCOTT described the watch fires of the English camp and the effect at night among the alleys and parterres of the Champs Elysées. Naturally he was elated, for, as he said, in the sound of the bugles and drums there was pride and victory and honour, a part of which at least descended to the most retired and humblest fellow-subject of WELLINGTON. But, as he remarked, there was much around him to temper that elation. There were monuments on every hand to demonstrate the victories of NAPOLEON, yet the great man himself was an exile in the most solitary spot of the civilised world. Now, although SCOTT refers at some length to the arch of the Place du Carrousel, the column of the Place Vendôme, and other memorials, there is not one word about the Arc de l'Etoile.

The arch remained neglected until 1825. In 1823 France intervened in favour of an absolute monarchy in Spain. On the other side were undisciplined troops, and in the end French discipline prevailed. Trocadero was taken by assault and Cadiz capitulated. The victories were insignificant if compared with those of the Republic and the Empire. But the astute advisers of the moribund LOUIS XVIII. considered it would be politic to make capital out of them. It was therefore decided to complete the Arc de l'Etoile as a memorial of the Spanish triumphs. The works were entrusted to HUYOT. He proposed to adopt some of RAYMOND's ideas, whereupon the Minister dismissed him. A commission of four architects—MM. DE GISORS, FONTAINE, LABARRE and DEBRET—were appointed in his place; but in a short time HUYOT was restored and continued in office until 1833, when he was again dismissed. It was reserved for BLOUET to finish the structure on which so many architects had been engaged.

It cannot be said that the arch is complete so long as the platform is deprived of sculpture. The original idea appears to have been the ordinary one of having NAPOLEON or some representative figure in a quadriga drawn by several horses. A few years ago M. FALGUIÈRE, at his own expense, prepared a model of large size, which he was allowed to place on the summit. Although it was vigorous in design, it did not satisfy Parisian eyes, and it had to be removed. Huyot proposed to set up a series of single figures which would represent the principal cities of France. RUDE, whose *Departure of the Conscripts* is the noblest of all the decorative works connected with the memorial, suggested that the arch should be surmounted by a colossal figure

of France seated on a lion, holding the torch of civilisation in one hand, while the other rested on a sword. At the four angles were to be groups of kneeling figures representative of Russia, Prussia, Austria, and, notwithstanding Trafalgar and Waterloo and many other defeats which France had to endure, Great Britain was to appear as one of the tributary nations that owed its existence to the generosity of France. The scheme was only another instance of the insanity of genius.

BARYE proposed that a small hill should be constructed on which would stand a great eagle with its wings outspread. But French savants calculated that the force of the wind would be too strong for bronze feathers. The result is that the platform now only serves to enable visitors who have the courage to ascend about three hundred steps to enjoy one of the best views of Paris. It is worth noting that VICTOR HUGO in his long poem on the arch adopted BARYE'S idea; for, addressing the structure, he said:—

Toi qui lèves si haut ton front large et serein,
Fait pour changer sous lui la campagne en abîme,
Et pour servir de base à quelque aigle sublime
Qui viendra s'y poser et qui sera d'airain.

The poet, it may be mentioned, became an enemy to the Government of LOUIS PHILIPPE because, when the names of the generals were engraved on the masonry, his father's was omitted:—

Je ne regrette rien devant ton mur sublime
Que Phidias absent et mon père oublié!

It is now difficult to say whether the arch would not have been a memorial of the Spanish war if greater expedition had been used. There was dissatisfaction, but for some years the Monarchists could do as they pleased in France. Fortunately the structure was not completed in 1830, when LOUIS PHILIPPE was elected as king. From the character of the sculpture the arch became a memorial of the Republic and the Empire. For such a purpose it is admirably adapted. The Arc du Carrousel, although an adaptation of an ancient Roman work, has not the simplicity desirable in a national war memorial. As SIR WALTER SCOTT said, "The effect of this monument seems diminutive when compared to the buildings around; the columns, made of a mixed red and white marble, are rather gaudy." No such dispraise can be spoken when judging of the Arc de l'Etoile. The great groups suggest the Rising of France, the Triumph of NAPOLEON, the Invasion of 1814 and the Peace of 1815. The first, which is RUDE'S masterpiece, receives far greater attention than all the others. But the remainder, if considered merely as decorative groups, possess much interest. The bas-reliefs of the funeral of MARCEAU, the battle of Aboukir, the passage of the bridge of Arcole, the taking of Alexandria and other battle-scenes, and the frieze with its numerous figures representing the departure and return of the French armies, are too high to be adequately analysed. But, whatever may be the character of the detail, decorative effect is attained. The bucklers on the attic are engraved with the names of several of the battlefields.

If we may judge from engravings the triumphal arch soon after its completion must have appeared less satisfactory than at present. Some fifty years ago it was decided that the avenues in the neighbourhood of the structure should be treated with sufficient uniformity in order to suggest that there was a relation between them and the central ornament. The result is that in no part of Paris are the streets laid out in a more satisfactory manner. Whatever line is followed the arch is seen under favourable conditions, and it may be said without exaggeration that grandeur is gained by the arrangement of the avenues at small cost to the possessors of property. The principal view is from the Louvre to the triumphal arch, and it is unrivalled. It is difficult to say whether the existence of the Arc de l'Etoile obliges people to give a more favourable judgment of NAPOLEON and of the condition of affairs of which he was the

result. But it is at least undoubted that when he decided on the erection of the arch he was doing much towards the enhancement of the beauty of Paris and was giving a lesson to other cities on the disposal of open spaces.

MODERN FRESCO PAINTING.

ALL who care to see fresco painting employed in English buildings must consider the reports of Professor CHURCH with serious attention. He is the specialist who is now consulted by the Office of Works respecting the condition of the paintings in the Houses of Parliament. As professor of chemistry in the Royal Academy, the duty must have peculiar interest for him. If he could only discover some method to prevent the deterioration of the works, he would be rendering a service to art and the country which is not easily estimated. We know that one discovery in chemistry often leads to another of more importance, and by watching the effects of time and the London atmosphere upon the paintings in the Houses of Parliament the Professor might also hit upon some material which, added to the colours or plaster ground, would allow fresco paintings in this country to endure at least as long as ordinary oil paintings.

When it was proposed to employ fresco for the decoration of the Houses of Parliament reliance was placed on the fact that some relics of the paintings executed in the reign of HENRY III. on the walls of St. Stephen's Chapel had survived during six centuries. What was no less interesting, seventy-four out of the seventy-six painters employed on the work were Englishmen. There was consequently over-confidence as to the success of the great experiment. The artists accepted the commissions with alacrity and few preparatory experiments were made. Information respecting the methods employed by Italian artists when village churches were adorned with fresco was forthcoming; the process appeared to be very simple, especially to artists who could lay on their colours with decision. Unfortunately sufficient allowance was not made for the composite and artificial atmosphere which prevailed in London and which was unlike the clear and pure air of Italy.

It was not long before it was discovered that fresco painting was not enduring under all circumstances. If paintings by great masters on the exterior of Venetian buildings have vanished under the influence of the local air, what hope was there for paintings in the ill-ventilated Houses of Parliament? The colours fell off in flakes, exposing the plastering beneath, and thus making works appear as if they had been painted several centuries ago and were subjected to repeated acts of vandalism.

Science, which had been disregarded, was then invoked to save the pictures, and as a matter of course the authorities turned to German artists and German chemists for advice. The result was that when MACLISE began his immense *Meeting of Wellington and Blücher* in the Royal Gallery, he was crammed with a knowledge of chemical processes. There is no doubt his colours did not give immediate signs of decay, for they remained attached to the walls; but he had not completed the work when there was evidence that the figures were becoming more and more dull. Efforts were made to resist the transformation which threatened to make a brilliant picture little more than a monochrome. But none of them were as successful as the process suggested by GEORGE RICHMOND, R.A., which simply consisted of dabbing the surface with leather pads and silk handkerchiefs—a process which certainly was not scientific. MACLISE was not the kind of man to throw blame for his failure on others. When he said that the wall exhibited every variety of bad plastering and that owing to the unequal distribution of sand with the lime discoloration was too evident over the entire surface, we may be sure there was just ground for his allegations.

MACLISE had studied the water-glass or stereo-chrome process in Germany, and artists and chemists had given him the most ample details. Vitreous glass was not, however, able to withstand the air of London. Dr. PERCY recommended that the frescoes should be covered with a coating of paraffin dissolved in benzole. He believed that fresco proper as well as water-glass treated fresco would of necessity be injured by the atmosphere of London. Another chemist considered that besides the atmosphere, the colours employed, and especially the yellow ochre, were factors in the decay. It is difficult for science to atone for defects in the materials employed by artists. Some of the paintings in the Houses of Parliament had reached a state which was hopeless. But Professor CHURCH's report shows that the systematic efforts of the last thirty years have been advantageous, for some of the more important of the paintings continue to retain decorative value, although in a diminished degree if compared with their original condition.

"Slight touches of colour and the application of a little diluted spirit fresco" have improved MACLISE's *Wellington*. DYCE's *Sir Perceval*, from which decayed portions were cut out and others repainted in 1868, was again operated on in 1894. The report says that "places where the paint had peeled off were touched up with tempera colours, while the weak areas of the ground or of the original paint received several applications of a solution of paraffin wax in toluol, to which had been added a small proportion of copal varnish free from lead." Recently it was found that other parts of the same fresco required patching, and it was treated with ceresin, spike lavender and toluol, a mixture which Professor CHURCH has found to be enduring. But he considers that the wall-paintings should be cleaned and repaired at intervals of three or four years, owing to the increased amount of sulphuric acid in the atmosphere of London.

The paintings should be carefully preserved, not so much for their intrinsic merits, but as evidence of a spirit which existed in England about 1841. Then a Fine Arts Commission was appointed to consider the decoration of the Houses of Parliament. It was anticipated that if the history of England could be represented on the walls much would be done towards educating the people. It was also expected that the artists who received commissions would have to employ several assistants, and in that way a school of fresco painters would be formed. The public as well as the private buildings of the country were supposed to offer unlimited opportunities for the exercise of the art. The Commission was composed entirely of amateurs, and it is therefore easily understood why the aspirations should be of almost boundless extent. If the members had condescended to admit CHARLES BARRY, the architect of the building, among them, he was likely to give a practical turn to the subjects, and many of the errors might have been avoided. On his own account he had visited Munich in order to study the frescoes which were in progress. He came to the conclusion that they were not adapted for architectural decoration, and consequently did not enhance the beauty of the building in which they were to be found. He advocated the use of wall-painting in the Houses of Parliament, but he desired to have an arrangement by which painting, sculpture and architecture would form an effective union. BARRY wished to see his building decorated in a proper manner. The Commissioners wished to use the wall spaces in the most important building in the country for the display of subjects of historic interest, which would have some connection with the history of parliaments and law-making. We need not say that neither end was attained. The building is not properly decorated in an artistic sense, and it would require not only unifying power but imagination to make out any system to explain the wall-paintings.

Architects are therefore justified if they maintain that the wall-painting of the Houses of Parliament

became a failure because it was executed independently of any advice of the architect of the building. Much depends on the character of the plaster ground. But what member of the Royal Commission was competent to decide at Westminster about the proportions of the lime and sand, or whether such a compound was preferable to marble dust? Fresco painting is still practised in Italy, and the artists find it so simple a process they cannot comprehend why there should be failure in London, especially when they hear of the costly preparations. Fresco paintings were also occasionally produced in the eighteenth century in this country by wandering artists, which are not entirely destroyed by time and the atmosphere, although little care was taken to preserve them. The experience in the Houses of Parliament is, however, supposed to be decisive of the question. Walls are not painted because it is believed that, careful as the artist may be, he can never produce anything more satisfactory than the Westminster frescoes, and without constant watchfulness and expense the results may be more deplorable.

SMALLFIELD PLACE.*

SMALLFIELD PLACE is situated in the manor of Burstow, which was the lordship of Stephen Fitz Hamon, who assumed the name of the manor and was called Stephen de Burstow, in the reign of Richard I. He was a descendant of a younger brother of Robert Fitz Hamon, whose daughter and heir married Robert, a natural son of King Henry I., and was created Earl of Gloucester. It is certain that a family of De Burstow existed here at the latter end of the reign of Edward III., and that during this reign the stone mansion was erected. It was called Crullings, and was given to John de Burstow by Bartholomew, Lord Burgherst, as an acknowledgment for assistance received from him when thrown from his horse in a battle during the wars with France in the reign of Edward III.

Malden says:—"This John de Burstow was member of Parliament for the county of Surrey in 1301, and was paid four shillings a day as member of Parliament, together with his expenses in going and coming to and from Parliament; and in 1315 the two members for Surrey received 19*l.* 4*s.* for attendance from the octave of St. Hilary to the Sunday after Pope Gregory, that is, January 20 to March 9 in that year."

It afterwards came into the possession of the family of Byshe, who appear to have altered the name to Smallfield Place, and the embattled house which is yet standing was built by Edward Byshe in the reign of James I., 1603-25.

He was a bencher at Lincoln's Inn and a great practitioner in the Court of Wards, and in allusion to his practice and its successful results, as well as to the folly of his clients, he used jokingly to remark that he had built his house with woodcocks' heads, the woodcocks being his foolish clients. He had much property in the neighbourhood, and his name is still preserved in Byshe Court, a farmhouse near.

His son Edward was in 1640 M.P. for Bletchingley; in 1643 he was made Garter King at Arms; in 1646 the House of Commons passed a vote for making him Garter and Clarencieux. In 1654 he was M.P. for Reigate, and in 1658 M.P. for Gatton. After the Restoration he was obliged to quit the office of Garter in favour of Sir Edward Walker, but obtained a patent, dated March 10, in the thirteenth year of Charles II., as Clarencieux, which was given him in consideration of his having during the usurpation preserved the library of the College of Arms. In 1661 he was knighted and again sat for Bletchingley, and he was reported to have been a pensioner at 100*l.* a session. His reputation declined during the latter part of his life, for, after the Restoration, being much in debt, he abused his office of Herald by several unwarrantable grants of arms to supply his necessities, insomuch that Mr. Dugdale Norroy, who had been his greatest friend, and by whose interest he was brought into office, joined with Garter and other officers in a petition to the king against him. He died in the parish of St. Paul, Covent Garden, December 15, 1679, and was obscurely buried in the church of St. Olave, Jewry.

* A paper read at a meeting of the Upper Norwood Athenæum by Mr. Henry Virgoe on July 7.

Smallfield Place is the remaining part of a mansion which presents much of the appearance of a Tudor manor-house, and is acknowledged to be the most perfect and most interesting example of Domestic architecture in Surrey. A considerable part of the house was taken down some years ago, and the restoration of the remainder has been very carefully carried out by the present owner, Mr. W. Leslie Moore. Only a small part of the moat has been left. The chief part of the alterations which have been made are the building of a billiard-room with rooms above made of the old stones of the original house, so they do not seem out of place, and the making the top floor a trifle loftier, the panelling being used to repair the lower rooms. The old fireplaces that were bricked up have been reopened. Some are made from a single piece of stone. Plaster ceilings have been removed to show the oak beams. Arches found built into the walls have been restored to the doorways. Mullions and sills of the windows have been cleared of their whitewash and paint, and old inscriptions in the stone have been discovered. One is dated 1631.

SMALLFIELD PLACE.

There is much oak panelling in different parts of the house—the Elizabethan staircase of great beauty has carved oak panelling instead of balusters, and some elaborately carved chests. In the square hall the great object of interest is the richly-carved Tudor screen and the large fireplace, 16 feet across, with access to a "priest's hole" or hiding-place in the floor above.

In Aubrey's time there were various armorial bearings in the windows, and the date of 1661 is on the knocker of the door; on one of the leaden pipes the arms of Byshe still remain, viz. a chevron between three roses with the initials M
EB.

The old gardens, which had been destroyed to a great extent during the tenancy of the Hookers, have been relaid in the old-world manner, and the ancient box hedge on the terrace wall is now being coaxed back into something of its former grandeur.

A few old coins, notably a groat of Queen Mary, have been found during the restoration, but nothing of very great value.

Edward Byshe was the owner of Smallfield Place and estate in 1658. His son, Sir Edward Byshe, sold it in 1675 to Thomas Turgis, who gave it by will to Turgis Newland, a kinsman, from whom it descended on the death of his brother, Sir George Newland, in 1749, to the daughters of another brother, whose representatives in 1769 sold the property to Robert Bulkeley. In 1788 it was resold by the trustees under his will to John Ewart; in 1808 the estate belonged to his grandson, John Manship Ewart. Subsequently it was purchased of the Ewarts under the authority of the Court of Chancery for Willett Willett, afterwards came into the possession of Thomas Hudson, and after him it was the property of Isaac Martin Rebow, of Colchester.

The house was let as a farm for three generations to farmers of the name of Hooker, the elder Hooker being the first master and founder of the Burstow foxhounds. On the expiry of their lease the property was purchased by Mr. and Mrs. Leslie Moore, the present owners, to whom we are indebted to-day for permission to go over their historic mansion.

TROTTON AND COWDRAY.

THE members of the Hampshire Field Club and Archæological Society foregathered in goodly numbers at Petersfield, says the *Hampshire Advertiser*, for an excursion to Trotton and Cowdray in Sussex, just over the Hampshire border. The directors for the day were the Rev. G. W. Minns, F.S.A., Mr. Norman Nisbett, A.R.I.B.A., of Winchester, and Mr. W. Dale, F.S.A., of Southampton, hon. secretary. Assembling at Petersfield railway station about eleven o'clock, they proceeded in brakes and on cycles to Trotton, fine views being obtained en route of the western end of the great Wealden area. Arrived at Trotton Church they were met by the vicar, the Rev. F. Ashton, and entered the sacred edifice.

Mr. Nisbett read a paper in which, before noticing the architectural features or the particularly fine series of wall-paintings recently uncovered, he called attention to the remarkable "brasses" which had for such a long period made the church famous. Taking these in chronological order, he said that commemorating Margaret de Camoys, who died in 1310, was the earliest brass to the memory of a lady in England, the next being that of Lady Cobham, at the old church of Cobham, near Rochester, which has perhaps the finest collection of brasses in England. He pointed out the principal features of the brass, particularly noticing that outside the figure the background was "powdered" with daisies in allusion to the lady's name, which reminds us of the decoration on the gateways of Lady Margaret Beaufort's Cambridge colleges. Another feature was the canopy with its two pinnacles. This is of particular interest when compared with the canopies of the larger brass, representing Thomas, Baron Camoys, and his lady. The date is 1419, or about a century later than the other brass. Lord Camoys commanded the English left at the battle of Agincourt, and for the bravery displayed on that occasion was created a Knight of the Garter, and he was shown with this decoration below the left knee. The armour was described in detail, as well as the heraldry on the monuments.

Dealing then with the church itself, Mr. Nisbett said that for his notes upon the building he was indebted to a pamphlet written by Mr. Philip Johnston, secretary of the Sussex Archæological Society, and the architect who carried out recent repairs there. There was a church here at the time of Domesday survey, when Earl Roger held Traitone. The present tower was added to the older church about 1260. The church was later replaced by the present one, probably about 1300. It is most probable that this rebuilding was undertaken by Sir Ralph Camoys or his son, Sir John, husband of Lady Margaret. The details of the window tracery are worth notice, as, although they are excellent examples of Geometrical work, the quatrefoils are somewhat free. One of the doors is the original oak one, with its contemporary wrought-iron hinges. The old ironwork also is preserved on the priest's door in the chancel. At the side of the latter is a square-headed opening of the kind usually known as a "low side window." The altar tomb on north side of the chancel is believed to belong to another Margaret Camoys, whose will was dated 1386. She left money for the repairs of the church of Tradington (Trotton).

Mr. Dale followed Mr. Nisbett, and said that the fact of powdered glass being used in the enamels for the shields of the brass of Margaret de Camoys was discovered by Mr. W. H. St. John Hope. In the very fine Hastings brass in Elsing Church, in Norfolk, the same material is used. One of the supporting figures of this brass was identified in the Fitzwilliam Museum at Cambridge, and has been restored to its original place. It was in the refixing of this portion of the brass that the discovery was made. Looking about for any other example, Mr. Hope thought of this brass, and sent for a small portion of the material still adhering to the matrices of the shields. This was carefully examined and found to be powdered glass. These are the only two brasses known that have this peculiarity. If any other is discovered Mr. Hope would be glad to hear of it. Mr. Dale added that he would like to see this unique brass always covered. A special mat to lay over it would not cost much, and could easily be removed for inspection of the brass.

After thanking the vicar the visitors left the church, and passing over a fine fifteenth-century bridge they went on to Midhurst, halting at the Angel Hotel for about an hour for luncheon, and then proceeded to Cowdray Park, a few minutes' walk away, to visit the ruins of a fine sixteenth-century mansion which was burned down in 1793. Here a paper on "Cowdray, its History and Associations," was read by the Rev. G. W. Minns. He said:—

That the Hampshire Field Club and Archæological Society should visit Cowdray has been long a cherished wish of some of its members. A close connection existed between the Hampshire family of Wriothesley and the Sussex families of Fitzwilliam and Brown, who for 300 years made their home at Cowdray, which was built by Fitzwilliam, who bore the title of Earl of Southampton. A daughter of the house was married to Henry Wriothesley, second Earl of Southampton, of Place House, Titchfield. The similarity of the architecture of that house with Cowdray will at once be recognised, although Cowdray far exceeded Titchfield in grandeur. The magnificent monument of the Wriothesleys at Titchfield has its replica in the mutilated memorial of Sir Antony Brown, first Viscount Montagu, and his wives erected in Midhurst Church and removed to Easebourne, where it will be seen to-day. These and other circumstances in the course of history attest to a sympathy between Cowdray and Titchfield, in which Hampshire antiquaries will share. Dr. Johnson, who visited Cowdray in 1782, exclaimed, "Sir, I should like to stay here for four-and-twenty hours. We see here how our ancestors lived." In early times (Henry I.) the lordship of Midhurst and Cowdray was a possession of the De Bohuns, who had their castle on a neighbouring hill and removed somewhere near this site in the time of Edward III. In 1489 John de Bohun dying without issue male his heiress brought it by marriage to Sir John Owen, whose probable effigy is in Easebourne Church. From the Owens the Cowdray property was purchased in 1582 by Sir William Fitzwilliam. He rose to great eminence under Henry VIII., being attached to the king's person, became Lord High Admiral, was made Knight of the Garter and created Earl of Southampton (1527). To him we must assign the building of Cowdray, although some portions may belong to an earlier period. Sir William Fitzwilliam was the son of a Yorkshire knight, his mother being Lucy, daughter of John Nevill, Marquis of Montacute. This lady on the death of her husband married Sir Antony Brown, of Betchworth Castle, Surrey, Standard Bearer of England. William Fitzwilliam, Earl of Southampton, died in 1543, without issue, and bequeathed Cowdray to his half brother, a second Sir Antony Brown, and the first of the Browns of Cowdray. He also was much in favour with Henry VIII., and with Fitzwilliam had been engaged in matrimonial negotiations about Anne of Cleves, having been sent in 1540 to the Court of John of Cleves to act as proxy at the marriage of the king, while Fitzwilliam met the new queen at Calais to conduct her to her future country. In the same year Sir Thomas Wriothesley, the Lord Chancellor, proved useful in the repudiation of the marriage.

For their co-operation in the king's matrimonial iniquities each of the trio was rewarded. Although rigid Roman Catholics, they were not averse from sharing in the spoils of the monasteries. Wriothesley acquired a large share of the religious houses in Hampshire; Fitzwilliam received a grant of Easebourne Priory; the famous abbey of Battle fell to his half-brother, Sir Antony Brown. His son, Sir Antony Brown III., was created (1554) Baron and Viscount Montagu, the title being chosen on account of his descent, on the female side, from the Marquis Montacute. Viscount Montagu died in 1592, and was buried in the family vault in Midhurst Church. Nine viscounts bore the title in succession. On the death of the eighth viscount (whose tragic story remains to be told) the title devolved upon the next heir male, a friar, who received the Papal dispensation in order to marry and carry on the line, but dying without issue the title became extinct, and Cowdray was inherited by the sister of the eighth viscount, the wife of Mr. W. S. Poyntz, by whom she had two sons and three daughters. The sons came to an untimely end. Mrs. Poyntz continued to reside until her death upon the estate, which was sold in 1845 for 330,000*l.* by her daughter to the Earl of Egmont, and is now possessed by the eighth earl, who succeeded to the title in 1897.

Spelman, in his "History and Fate of Sacrilege," records the disasters which have befallen persons and families who acquired property devoted to the Church or purposes of religion. Similar calamities may possibly be traced in other cases, but certain it is that in the history of the Wriothesleys, Earls of Southampton, the four who bore the title had a large share of misfortune, and the experiences of the heirs of Cowdray afford instances in support of the theory which Spelman maintains. William Fitzwilliam, the possessor of Easebourne Nunnery, died without issue. Sir Antony Brown, the father of the first Viscount Montagu, acquired Battle Abbey, and while he was holding a feast in

the great hall, according to tradition, there came to him a monk, who foretold the doom of his family, "By fire and water thy line shall come to an end and it shall perish out of the land." The imprecation was apparently fulfilled by the burning of Cowdray House on September 24, 1793, leaving only bare walls and vacant windows to attest to its former magnificence. During the following month of the same year the eighth Viscount Montagu perished in attempting to pass in a boat the falls of the Rhine near Schaffhausen. His heir, the *ci-devant* friar, died without issue, and the estates came to Mrs. Poyntz. A further calamity befel the possessors of Cowdray, as the two little sons of that lady were drowned at Bognor, in 1815, by the upsetting of a boat. There are those who regard the story of the monk and his curse as a fiction, but the calamities which befel the family are solemn truth, and the destruction of their home is evidenced by what we see around.

Cowdray has witnessed many persons and events of national importance. Hither in 1538 the ill-fated Margaret, Countess of Salisbury, was brought as a prisoner from Warblington Castle by William Fitzwilliam, and after a few days transferred to the Tower, where, after execution, her body lies, instead of resting within the beautiful chapel she had erected for her burial in Christchurch Priory. In 1552 King Edward VI. was here on a visit, and in a letter described Cowdray as a "goodlie house, where we were marvellously, yea rather excessively, banketed." Here in 1591 Queen Elizabeth was sumptuously entertained: "three oxen and 140 geese were served at breakfast." Guy Fawkes was received here, which circumstance led to the arrest of his host, Viscount Montagu, in 1606, suspected of complicity in the Gunpowder Plot, his imprisonment in the Tower, and the payment of a fine of 4,000*l.* The Parliament troops, under Waller, were quartered at Midhurst, December 1643, "where my Lord Montagu's house is, a known and professed Papist." Francis, the third Viscount, was a sufferer in the cause of Charles I., and Cowdray sustained great damage during its occupation by the soldiers of the Parliament.

Dealing then with the architectural features of the mansion, Mr. Minns said it was entered by a porch surmounted by the Royal Arms—France and England quarterly with a lion and griffin as supporters—and Lord Southampton's motto, "Loyaute saprowera." The doorway contains the cognisances of Lord Southampton, an anchor and a trefoil, with the initials W.S. and L.P. These probably represent the initials of his name with the first and last words of his motto.

Quitting the interesting ruins, the visitors went on to Easebourne Church. Mr. Minns said that Esborn, as it is known locally, in accordance with ancient spelling, was the seat of a little Benedictine nunnery and the mother church of Midhurst. The church was rebuilt in 1876. The font remains of the thirteenth century, and it is similar to that of Barton Stacy. The chief interest attaches to the mortuary chapel, where is the tomb of the first Viscount Montagu, which originally stood in Midhurst Church, and was removed here in 1851. In general design, ornament and execution, especially the "pomp of heraldry" there displayed, one is forcibly reminded of the beautiful tomb at Titchfield, which has recently been judiciously repaired. Its replica has suffered badly. It was originally of considerable height, so that the head of Lord Montagu, the kneeling figure at a *prie-dieu*, was on a level with the gallery in Midhurst Church, and it was the weekly amusement of boys to put a piece of paper into Lord Montagu's mouth. Two recumbent figures of ladies rest on the slab, one that of Lady Jane Ratcliffe, first wife of Antony, Viscount Montagu, who died at Cowdray, 1552, at the age of twenty, the other, his second wife, Magdalene, one of the daughters of Lord Dacre. Four marble obelisks stood at the corners of the tomb as at Titchfield, and the figures on the panels have been sadly broken. In the same chapel is a monument by Chantrey to commemorate Mrs. Poyntz and "her two only sons, unhappily drowned in the flower of their youth under the eyes of their parents." She died December 1830. Another monument by Monti is to the memory of Mr. Poyntz, who died April 1840 and lies buried here. His end was occasioned by a fall from his horse, which produced injury to the spinal column, from which he suffered for some years before his death.

A Committee has been formed under the presidency of Cardinal Richelmy to make arrangements for the erection of a memorial of Christopher Columbus in the Vatican gardens.

CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.

THE sixteenth annual meeting of the Cambrian Archæological Association was held last week at Carmarthen.

The Mayor, when receiving the members, said that if there was one thing in which the inhabitants took pride it was the historical associations and status of the town. He had come across a notice of Carmarthen in the year 1548. "The same towne of Karmarthen ys a fayre merkett towne having a fare haven and the flarest towne in all South Wales and of most scevillytie." He did not consider the statement was exaggerated. There was not in the Principality a single town of its size which contained so many objects of antiquarian interest. It had been said that if the old oak in Priory Street ever fell down Carmarthen would be swallowed up by the encroachments of the sea. The belief in that legend was proved by the efforts which had been made to keep the tree up, and those who visited it would notice that all that stood between Carmarthen and destruction now were the stones and mortar and iron bands which held the remains of the tree.

Archdeacon Thomas said that those who were at the meeting in the town in 1875 would well remember the address delivered by Bishop Basil Jones. There were two objects in which he felt great interest in Carmarthen—the parish church and the castle. The former was well kept, but he could not say so much of the castle. It would be a great credit to the town if the visit of the Association would lead to a movement for removing the unsightly buildings in front of it and displaying the fine gateway. He had much pleasure in vacating the chair in favour of Sir John Williams, who had shown by his ability and skill what a Welshman could do by his merits.

Sir John Williams then delivered an address, dealing with the history of Llanstephan Castle.

A paper by Professor Lloyd, of Bangor, on "Carmarthen in Norman Times" was read by the secretary, the Rev. T. Chidlow. The paper dealt with that obscure portion of the history of Carmarthen between the Roman occupation and the revolt of Owen and Cadwalladr, the sons of Owen Gwynedd in 1177. The author of the paper identified Carmarthen with "Llanteilyddog," one of the bishops' houses mentioned in the laws of Howel Da and other early records. "Teilyddog" was one of the disciples of St. Teilo, and "Llanteilyddog" a monastery of the primitive Welsh type gradually changing into a group of secular clergy. Rhydygorse was a castle of the "mote and bailey" type as early as the reign of William Rufus (1094). During the rising shortly afterwards Rhydygorse was captured by the Welsh, and Fitzbaldwin, the governor, had to return to Devonshire. In 1109 Robert of Gloucester founded at Carmarthen a stronghold of a later type, and no more is heard of Rhydygorse. After this date there was plenty of evidence that Carmarthen was a centre of royal administration for South Wales. At this time arose the distinction between old and new Carmarthen which existed until quite recently. New Carmarthen was a royal borough with a charter from King John, whilst old Carmarthen remained an ecclesiastical preserve under the protection of the venerable and mysterious Teilyddog. St. Peter's Church was built about 1120. In 1115 Bernard, the first Norman bishop of St. Davids, was appointed as a step towards subjecting the Welsh Church to the Norman power. Some records were quoted of Carmarthen in the twelfth century, showing that a knight was owing 20s. for having killed a Fleming, and another Carmarthen had to pay 7 marks for carrying off another's daughter by force. Carmarthen had in the twelfth century become a religious, military and administrative centre for South Wales.

Mr. Llewellyn Thomas said that the paper was a valuable contribution to an obscure period of the history of Carmarthen.

Rev. Griffith Thomas raised a discussion on the point whether the burgesses of Carmarthen had sworn fealty to William the Conqueror.

Professor Anwyl said that the borough was not then constituted, and there were no burgesses as such.

Mr. T. E. Brigstocke commented on the fact that the Roman remains were mostly found in the "old town"—the eastern portion of the borough.

Archdeacon Thomas quoted a passage from "Giraldus Cambrensis" which he translated "The ancient city is enclosed with walls of brick." This showed that even in the time of Giraldus there were remains of the Roman occupation.

Mr. Donne Bushell delivered a lecture on the astro-

nomical method of determining the age of stone circles. Certain lines clearly pointed to the points where the sun rose on Midsummer Day and at the equinoxes, and sometimes on the first day of May or thereabouts, the beginning of the farmer's year. Other lines, he believed, were laid down to mark the points where certain prominent stars arose—these being used probably as "warning stars," as they rose a short time before the sun, and thus gave warning to prepare for the sacrifice. However the points at which the stars rose varied slightly from year to year, but perceptibly from generation to generation, so that the grandson of the man who laid down the stones would not find these stellar lines answer their purpose. This fact, which annoyed the megalithic builders, assisted us. It was now a matter of calculation to find out when these lines had pointed to conspicuous stars. The speaker gave particulars of this method, which he had applied to a stone circle on the Precelly mountain, near Crymmych Arms. He found some lines pointing to the rising of the sun on certain days, but the other lines had no meaning now. One line he found to mark the rising of prominent stars about the time of the beginning of the Christian era, also in the ninth century B.C., and about 1040 B.C. At the latter date the line marked the rising of two important stars—Arcturus and Capella. Another line he found to mark the rising of the most prominent star in Andromeda also in the eleventh century before the birth of Christ. From this coincidence he concluded that that represented the date at which the stones were erected.

There were several excursions.

MAGDALEN TOWER.

IT is traditionally reported that the tower of Magdalen College, Oxford, finished in 1498, was planned by Cardinal Wolsey, and was his first essay in a science which he well understood and practised with extraordinary magnificence at his palace at Hampton Court, but of this circumstance the records of the college afford no positive proof. Fiddes, in his life of the Cardinal, would have us consider the tower of Magdalen College as an early essay of Wolsey's great mind, and it is called by his biographer Wolsey's Tower, and is cited as an instance of his good taste in architecture. But in 1492, when it was begun, Wolsey was only twenty-one years of age, and it is not likely that in so large a society, and under so grave and prudent a master as Dr. Mayhew, and at that era of college discipline (when the chief management of all weighty business was in the hands of the president and thirteen seniors) that young Wolsey at his time of life, and but recently a Master of Arts, should have had any power for the planning, or even influence for the promotion of such a structure. When the first stone was laid the founder had only been dead six years; we may therefore reasonably conclude that the edifice had its origin from instructions given him by the president and society, nor is it improbable that he had both seen and approved of the plan. Richard Gosmore, one of the lecturers on philosophy and middle bursar when the tower was begun, was made superior or supervisor of the work, with a stipend for his trouble, and to him payments were entrusted with the money beforehand for that purpose jointly with the president or some other person. In 1500-1 Pratt, the junior bursar, is named as having the care of the edifice, &c. The trust, however, was distinct from the bursarship, and we have no reason to conclude that there was any interval of superintendency between Gosmore and Pratt; or supposing one, that it was filled by Wolsey, to whom the honour of erecting the structure has been transferred from Waynfleet, the president and society, as far as we have been able to discover, without any foundation.

The Tower of Holy Trinity Church, Hull, is in danger through the loosening of the foundations. The structure is built upon oak trees interlaced with each other, and these have rotted and caused a subsidence. Mr. F. S. Brodrick, of Hull, architect to the trustees, has had the tower under observation for two years, and recently reported that immediate action must be taken. The cost is estimated at 5,000l. Mr. Francis Fox made an inspection of the foundations, and he finds that it will be necessary to underpin them and substitute brickwork and concrete for the timber.

NOTES AND COMMENTS.

WE believe that injunctions were formerly applied for to prevent the erection of post offices on account of interference with the light and air to neighbouring premises. In order to avoid repetition of the delay which usually follows such proceedings, the Bill which was introduced in Parliament last session on behalf of the Postmaster-General was treated as a private Bill. The notices required with those Bills were printed in the newspapers, and there was service on the persons interested in the properties which were to be purchased. Powers were sought to enable the Postmaster-General to acquire certain sites for the extension of post offices, two of those sites being in London and the other sites being in Birmingham, Blackburn, Bromley, Torquay, Carnforth and Walton-on-Thames. The Postmaster-General could build on the sites without reference to any questions of light which there might be connected with the adjoining properties, all those questions being left to compensation. He could also build on two or three sites which he had already acquired, compensating in the same way any easements of light in money, instead of allowing those easements to interfere with the character of the buildings. It would often be advantageous if the promoters of other private Bills relating to buildings in towns could secure similar privileges.

THERE is much similarity between the manner in which American judges deal with cases relating to materials in contracts and that employed in English courts. It is no easy matter to convince courts on both sides of the Atlantic how different is the cost of excavating and removal of one kind of material and another, and that, generally speaking, rock is far more difficult to deal with than ordinary earth. A case that came before the Supreme Court of Pennsylvania is an instance. The authorities of the town of Coatsville advertised for tenders for sewer excavation, and announced that for rock 3 dollars per cubic yard would be paid. As none of the tenders were considered satisfactory a new arrangement was proposed by which the town would supply the materials, so that the contractors were to provide labour only. One tender was accepted. But the contractors refused to sign the contract-deed on the ground that there was no mention of a price for rock. But they were assured by the borough engineer that it would be paid for at the established rate. The Court held that the borough engineer was only an agent, and was not a contracting party. There was nothing to show that rock excavation was contemplated, or that the borough engineer had any authority to enter into a contract respecting it. The Court therefore refused to recognise the claim, and the contractors will in consequence have to bear the loss. From a contractor's point of view the decision is absurd. But can any one say that such a judgment would be impossible in England?

AN inquiry which was held in Dublin on Tuesday indicates that in Ireland at least the Local Government Board intend to uphold sanitary officials. Complaints were made against a sub-officer of the sanitary department of the Corporation of neglect of duty and incivility. The public health committee accordingly dismissed him. The executive sanitary officer duly informed the Local Government Board, and asked for confirmation of the dismissal. The Board then asked that the sub-officer should furnish an explanation as to the charges made against him, and the explanation, which was duly furnished, contained a denial of the charges, and an allegation of prejudice on the part of the superintendent. An inquiry was ordered. The Local Government Board inspector stated that the Corporation committee had no right to dismiss the official without obtaining the consent of the Board. Judgment had been given in the Irish Courts in a similar case, but by the Public Health Act of 1878, Section 11, that judgment was erroneous. The decision of the Local Government Board will be given in due

course, but apparently the authorities have resolved to uphold officials whose duties are onerous and perplexing.

THE royal palace at Laeken is in a suburban park on the north side of Brussels. The building dates from the end of the eighteenth century, when it was erected by the Austrian Stadtholder of the Netherlands. NAPOLEON resided for some time in it. After the Belgian revolution it became the residence of LEOPOLD I. Although it was restored after the fire of 1890, it had on that occasion lost much of its original character. King LEOPOLD II. having resolved to alter and enlarge the building gave the commission, not to one of his own subjects, but to M. CHARLES GIRAULT, the French architect. As he was allowed a free hand and funds were abundant, M. GIRAULT has been able to transform the palace. He has added two great wings, one of which is arranged for residences and the other for receptions, fêtes and other occasions of State ceremony.

COMPETITION DESIGN FOR COUNCIL HOUSE EXTENSION, BIRMINGHAM.

IN preparing this plan the following motives have been kept in view, viz.:—Simplicity of arrangement; convenience of access to all parts by ample corridors, stairways and lifts; economy of construction; separation of the various departments, so far as the public are concerned, and easy intercommunication for the officials; the best and most profitable treatment of the site, with due regard to the grouping of departments; good approaches for public and staff and easy administration, and perfect capability of extension without injury or disturbance to the existing building. The plans and sections are very fully figured, so as to save unnecessary trouble to the assessors. Ventilation would be effected by means of a well-regulated system of inlets and outlets, assisted by natural or artificial helps in flues, fans or otherwise, at proper intervals, delivering fresh air at a height of, say, 6 feet above floor level, the vitiated air being carried away by ducts, the egress being as near the ceiling as possible; this, however, is not shown on the drawings, it being impossible to do so on so small a scale. The heating would be by water boilers of the Trentham Cornish type. One of these would heat the building and the other supply hot water to the lavatories, and both be coupled together in such a way as to be interchangeable. Accommodation is provided in a sub-basement for some thirty tons of coal or mixed fuel, equal to fifteen days' consumption for the two boilers. Cloak-room, w.c. and lavatory accommodation is provided on every floor. The work would be entirely fireproof as far as the term fireproofing is usually accepted. The floors are formed of rolled steel joists, with coke breeze, lime or cement concrete as circumstances require. The ceilings of strong rooms to be of Portland cement concrete interlaced with steel bars, crossing each other at regular intervals, forming a 6-inch by 6-inch mesh. Each strong room to be ventilated into corridors. Fire-hydrants will be fitted throughout the building.

Although "very little cooking" was asked for in the particulars given, an open range is provided for roasting, gas or electric potato or fish-oven, hot-plate, grille, &c.

The cost was estimated at 150,000/. The design is by Mr. BUTLER WILSON, of Leeds.

ST. DAVIDS CATHEDRAL.*

(Continued from page 114.)

THE bases of the piers are excellent, and decidedly Early English in section with the characteristic hollow. The plinths exhibit some variety; they are rectangular, adapted to the form of the pier, except that the cluster towards the aisle rests on a single semioctagonal member. In a single case on the south side we find a tongue of foliage on a small scale. The arches are very rich and elaborately moulded on the face towards the nave, in such a manner and to so great an extent as to retain as little Romanesque effect as is consistent with the continued use of the round arch and other distinctive features of the style. The outer order has sectional mouldings rapidly advancing towards Early English; the inner has surface mouldings partaking a good deal of a sectional character, and which, together with those in the clerestory, afford a valuable study of the process by which the projecting tooth-moulding of the Early English style was developed out of the surface-carved chevron of its predecessor. The western pair of arches, being narrower than the rest, are kept at the same height by being pointed, though not very well turned. Their responds are of somewhat different character from the piers, the bases being of another section and without the strongly-marked hollow, while the subordinate shafts on the eastern face were detached, and have consequently been destroyed. In estimating the merit of these arcades it must be remembered that no small portion of their effect is derived from the rich and deep tints of the ashlar employed, brought from the neighbouring quarries of Caerfai. The whole has been rescued from the white or dingy yellow wash with which it was formerly disfigured; part has been carefully scraped, and part washed the colour of the stone. Neither process has been as yet applied to the upper portions of the wall.

The arrangement of the upper portion of the elevation is singular, if not unique. It may be considered as one architectural member, being recessed within a single rear-arch, with its cill coming down to the string above the arcade. This, or something similar, is found in the choir of Southwell and elsewhere, but the manner in which it is effected seems to be peculiar to St. Davids. In the other instances the triforium is, architecturally speaking, entirely lost in the clerestory; at St. Davids it still remains a feature of no small importance. We may best regard the whole elevation as divided into two stages, of which the upper is again subdivided into two small ones. We have seen that two windows in the clerestory answer to each bay of the arcades; each of these has its own rear-arch, within which, below the opening of the window, is formed the triforium range, or what occupies its place. The result is one of great richness, but very confused. The amalgamation of distinct members precludes the usual appearance either of a church with, or of one without, a triforium; besides that the treatment of the triforium arches is by no means pleasing. The passage itself is merely formed in the thickness of the wall over the pier range, and only opens by an occasional round arch into what, were the aisles vaulted, would be the space between the double roofs, and which in the ceiled south aisle really is so, but on the north side is necessarily a portion of the aisle itself. The round arches just mentioned have a heavy roll, formed of a very small segment, like many others in the church, and a *quasi* capital.

This portion of the nave is almost as richly decorated as the arcades below, and, from the smaller scale of its parts, the ornament is more conspicuous. The principal arches, acting also as the rear-arches of the clerestory windows, are without shafts, but are lavishly enriched with the chevron and other Late Norman decorations. In some the Early English toothing appears in an almost perfectly developed form. The triforium itself consists of two pointed arches, also without shafts, but with the mouldings continued down the jambs and the edges rounded off so as to produce a sort of heavy coil. Whether this moulding did or did not also extend as a kind of string below the pointed openings is far from clear. In the spandril between each pair of arches is a small circle adorned alternately with a star and an interlacing moulding. There seems a certain want of harmony between these rich circles and the comparatively plain arches with which they are so closely connected.

Between the arches comprising this combined triforium

and clerestory still rise the shafts originally designed to support the contemplated vaulting—an early instance of vaulting being even contemplated over so wide a space. The vaulting was evidently designed to be sexpartite; the great width of the arches probably rendering two lateral cells in each bay imperative. The shafts are alternately single and clustered, those of the latter form being placed over the piers, as having to support the transverse arches of the vault. The arches—pointed ones—of the cells may be distinctly traced, but at present the capitals of the shafts only serve to support the still smaller clustered shafts of wood belonging to the gorgeous ceiling of the nave. This is an addition of Late Perpendicular, if not Debased date, some of its forms manifesting a clear tendency to Cinquecento, although they do not actually introduce any details that can be distinctly said to belong to that style, if we may except a peculiar ornament occurring on the pendants and representing a dragon.

This very singular, if not unique, structure is, in its construction, simply a flat ceiling of timber laid upon the walls; but by some, certainly unjustifiable, violations of the laws of architectural reality, such as are not uncommon even in the stone roofs of that period, it is made to assume a character wholly its own, and which it is very difficult to describe in an intelligible manner. By the employment of vast pendants, which at the sides take the form of immense overlapping capitals to the small shafts already mentioned, the ceiling appears to be supported by a system of segmental arches effecting a threefold longitudinal division of the roof and crossed by a similar range springing from the walls. Of course, these arches in reality support nothing, but are, in fact, borne up by what appears to rest on them. Notwithstanding this unreality and the marked inconsistency of this roof with the architecture below, notwithstanding that its general character would have been much more adapted to some magnificent state apartment in a royal palace, still the richness and singularity of such an interminable series of fretted lines renders this, on the whole, one of the most attractive features of the cathedral. Both the arches themselves and the straight lines which divide the principal panels drip with minute foliations like lacework in a style of almost Arabian gorgeousness. It is much to be regretted that this ceiling cuts off the top of the western arch of the lantern, which at once spoils the effect of the latter and gives an unpleasant appearance to the unfinished pendants of the ceiling when seen from behind, out of the choir. Still, this very view of the roof, in which hardly any other part of the nave is visible, is wonderful in the extreme.

The great width of the bays is nowhere so conspicuously shown as in the enormous span of the untoward arches marked out for vaulting on the north side. In three bays of the north aisle we discern the first precursors of the vast props which appear externally, in the form of bold and slender flying buttresses of Perpendicular date, abutting against the clerestory wall, and just visible without above the roof of the aisle. The greater part of their length is within the church, where they rest on the vaulting shafts, which were shortened and furnished with new angel capitals to receive them. The north wall of the nave has an almost fearful outward leaning, to counteract which this ingenious expedient was doubtless devised.

The roofing of the aisles is at present very poor. Below the external roof of the south aisle is the skeleton of a flat timber ceiling of infinitely plainer character than that of the nave; but the panelling either has never been added, or has been destroyed. It has a very extraordinary and by no means pleasing effect, occasioned by many of the hammerbeams hanging down in front of the windows. Some of their terminations are disguised by shields.

The reconstruction of the west front has not so entirely removed all ancient character from that portion of the church within as without. The fact is that the wall was only rebuilt from the level of the cill of the great west window upwards; below that point it merely received an external casing. Hence the difference in thickness, most conspicuous within. Consequently the original rear-arch of the western or bishop's doorway remains—a Norman arch with sectional mouldings and jamb-shafts. The west window also has a rear-arch of the same character, but rich with mouldings similar to those in the arcades and clerestory; this would appear to have been worked up again from its predecessor.

The central tower is naturally one of the most striking features of the cathedral in an external view, and although it has but little claim to commendation as an architectural

* From the *History and Antiquities of St. Davids*. Architectural Description of the Cathedral, by W. S. Jones, M.A., and E. A. Freeman, M.A.

design, and may perhaps be considered as in some degree directly opposed to the general tone of the edifice, it is nevertheless one of the parts which most prominently tends to influence the character of the whole. It is a tall yet massive structure of three stages without buttresses, and as the three belong to as many different dates and are built with very little endeavour to fuse them into one architectural composition, the whole is in truth little better than a piece of patchwork. The lowest stage rises very little above the original roof-line; it retains a small portion of Norman ashlar, with angle shafts at the north-east and south-east, but the rest is of rubble and exhibits no architectural features. An arch of construction in the west wall should, however, be noticed, as being, as we shall hereafter see, of importance in the history of the building. Above this stage, divided from it by a string adorned with the ball-flower, is a rather tall Decorated storey, with a long two-light window in each face; these are now blocked and otherwise disfigured. It may, however, be doubted whether this circumstance is not a gain in the general appearance of the tower, for if these windows instead of being almost concealed stood out in their full prominence as the natural belfry windows, the superadded stage would have still more the appearance of a mere excrescence than it has at present. In subordination to the central mullion is a transom and also a secondary mullion in each light, but as these do not run into the tracery, which is complete without them, they must be concluded to be later insertions, though it is difficult to conceive their object. Each window has a small niche on each side of it and two diminutive lights, hardly more than loopholes, above. On the west face the windows and niches are comprised beneath a large arch of construction. This stage also has angle shafts, but naturally much smaller than the Norman ones below. The highest stage of all is Perpendicular, and though certainly not beautiful may be remarked as at least an attempt to adapt a certain degree of enrichment to the position and character of the building. An open parapet and pinnacles are at least rendered a less incongruous finish to the steeple of St. Davids Cathedral than might have been expected. The chief fault is that the polygonal clustered shafts at the angles—evidently an adaptation from the earlier ones beneath—actually overlap, and consequently render this stage top-heavy—an effect not always avoided to the eye even when the stage is only of the same size as those below. A single flat octagonal shaft runs up the middle of each face, and the windows, mere lancets, with depressed heads, are placed close to it on each side. The open parapet is but poor and the eight pinnacles odd, hexagonal with small shafts at the angles, and finished at present with small domical terminations, some of which have been mutilated; while from the appearance of one at least of their number it would seem exceedingly doubtful whether this was their original finish.

In the interior of the tower the four grand arches which form the lantern are of very noble proportions and richer than is usual in large churches, but they have been more marred than almost any other equally conspicuous part of the cathedral by the maltreatment of later times, and are not enhanced in beauty, though greatly so in singularity, by the fact that one, the western, is round while the rest are pointed. They are, however, of very much the same general Late Norman character, though certain differences may be observed in their capitals and mouldings. The result of this difference of shape is that though the western arch rises from a higher point, its apex is lower than those of the other three and the string above it is consequently carried along at a lower level than the other, which is later and is connected with it in the usual manner. The eastern and western arches are as usual more richly decorated on their western than their eastern faces. The western arch especially is one of the most magnificent pieces of enrichment in the whole church. It has been already mentioned as being partially concealed by the ceiling of the nave. Till lately it was completely blocked, as its southern fellow still remains. The shafts supporting the inner member of the eastern arch appear to have been mutilated, and probably such is the case. Yet they must always have been corbelled off, at however small a height, as the base-moulding is continued along the square face. This is doubtless connected with certain peculiarities of ritual arrangement, to be hereafter mentioned. Over each arch is a decorative arcade forming a triforium. Over the western one it consists of eight quite plain pointed arches resting on Norman shafts. This arcade has always been blocked; smaller arches (now also blocked) having opened

in the centre into the passage behind. The way in which the two are combined is very elegant. The string over this arcade is enriched with the billet. Those over the other three arches are decidedly Early English, though they retain a very slight trace of Romanesque character in their capitals. They are worth notice as presenting a combination of shafts, corbels, and large bowtells furnished with bases like shafts. There is also a passage in the stage above, by the old belfry windows, with an arch on each side opening into it.

How much of this tower should be open to the church is to a great extent a question of taste, and the position of the roof has doubtless varied at the different periods when the tower itself was raised or altered. At present the arrangement as to this point is eminently unsatisfactory, as the middle or original belfry stage is cut in two by a wooden vault rising from stone perpendicular springers resting on earlier shafts. There is no appearance at any point of the tower to lead to the conclusion that a stone spire was ever designed.

The transepts present the appearance of a tolerably uniform original design both within and without, but they have undergone more alterations at once striking the eye than perhaps any other portion of the church. The roofs have lost their high pitch by a curious process—not having the whole fabric lowered, but only the upper part cut off square, or rather, as the original high pitch, though parallel with the commencement of that which has thus been prematurely cut short, is positively lower than it, they must have been entirely reconstructed in this curious form. Meanwhile the gables have been lowered in the ordinary manner so that they do not agree with the roofs. The fronts, north and south, have undergone many changes, and the original Romanesque design survives only in the flat turrets with angle-shafts which flank both and in a slight vestige of a string in the south front. And even these turrets have been tampered with and carried on in an octagonal form, and finally these later additions have lost their original finish. Large windows had been inserted in both, that in the north recessed between two broad pilasters within the turrets; this was bad Perpendicular, for which a large Decorated window, chiefly copied from one of those at Sleaford, has been substituted. The great south window must have been Decorated or very early Perpendicular, and had its arch round or very nearly so; it is now blocked (though it may be traced throughout), and four Perpendicular windows arranged in two stages have been inserted, besides a segmental-headed opening above them which is now blocked. When the gable of the south front was lowered it was made to rise from a higher point, and as the apex of the great window rose higher than the masonry of the walls, the horizontal string has been curiously raised to make room for it. In the gables of both transepts are Perpendicular openings; that in the south, pointed with a large cavetto, appears to have contained tracery, while its northern fellow is much smaller and square-headed of a single light. The west end of each transept retains an original pilaster; the north has a blocked Norman doorway and window above it; instead of the latter we have on the south side a Decorated insertion lately renewed.

The south-east and north-west angles of the transepts have received, like the north aisle, the addition of vast props of masonry, and in the south this seems to have been connected with the addition of an eastern aisle, since modernised.

The internal architecture of the transepts is almost entirely Transitional Romanesque, the pointed arch now appearing on a large scale. It is the form exclusively employed in arches of construction, though a few round ones still occur in the decorative members. This, the usual course of the development, differs, as must have been observed, from what we have seen in the nave. These transepts form, perhaps, the best exhibition in the church of a peculiar form of incipient Gothic found in this church and several others in South Wales and the West of England. There is general resemblance in detail between the Transitional and Early English architecture of St. Davids and Llandaff cathedrals, Cheriton Church in Gower and Slymbridge in Gloucestershire; and there is a similar resemblance in foliage between the South Wales cathedrals and the great churches of nearly the same date in Somersetshire. This seems to show that the influence of Bristol and Somersetshire models, which has been often pointed out as having so great an effect upon the architecture of South Wales during the Perpendicular age, had commenced even

at this early period. And it is the more remarkable, both as being spread over a long space of time, and as being almost entirely confined to detail affecting buildings which differ widely from each other in the character of their principal constructive features. We shall have, as we proceed, to point out some other instances of this connection with Somersetshire at a later age, though in the latest period, when it is elsewhere the most common, we find but little trace of it at St. Davids. In these transepts the peculiar character of the more slender shafts has freer scope than in the nave and choir, where a more massive pier is employed; we may observe the general omission of the neck-moulding and the use of the ogee keel, as at Llandaff. The latter is here applied very curiously, being in several of the members doubled and set laterally, the effect of which is by no means pleasing, though it may have had some influence on the architecture of a later period.

The transepts are approached from the nave aisles, not, as usual, by arches, but by original Norman doorways with their inner sides to the transepts. They are rather plain, and exhibit in the inner order and in the rear-arch the same shallow bowtell as some other portions of the building; the northern one has the inner arch of a trefoil form, and one of its capitals has carving of a character unusual in this church. At the east end of each transept are three pointed arches, including those which open into the choir aisles. The remainder were designed as recesses for altars, with the exception of the extreme one on the north side, which opened into St. Thomas's Chapel (the present chapter-house), and that such was its original purpose is shown by its being furnished with mouldings on both sides. These arches form a continuous range, but those leading into the choir aisles are somewhat lower than the rest. The arches themselves are plain, compared with those in the nave and choir, having no ornamental mouldings. There is a considerable diversity in the piers and responds, which may be remarked as somewhat low in proportion to the arches which they support. The neck-moulding is entirely absent except from a single member of the southernmost arch, where we also find a round abacus. This last feature occurs nowhere else in work of this date except in the eastern triplet; the octagonal form, however, is freely used. In the corresponding arch in the north transept we find a continuous bowtell, which has an odd effect. The responds adjoining the lantern piers present another remarkable feature, namely, a detached column of dimensions very unusual for such a position, and rather resembling in size and proportion those which often serve as piers in small Norman churches. They rise, moreover, in a singular manner out of masses of masonry like the set-offs of a buttress.

The western windows of the transepts are far more perfect within than on the outside. In the south transept the rear-arch and shafts of the original round-headed window are preserved, the pointed insertion, which alone appears outside, not having interfered with them. In the north transept we shall perceive, what we should hardly have guessed externally, though on attentive examination some traces may be recognised even there, that the window still remaining was a member of a couplet, the other light being to the north of it. The latter is completely blocked, flush with the surface of the wall, but it is easy to perceive that the northern shaft of its fellow is not a mere jamb-shaft, but a whole shaft partially blocked. The spring of the label also remains, and the whole of the arch can just be traced out. Some corbels remain in this corner of the transept; it is not easy to divine their use, but whatever rested upon them would necessarily have interfered with this window, and may therefore account for its being so completely blocked. Of the large doorway in the north transept no internal traces remain.

Both transepts have at present mean modern roofs of wood, but in the north may be discerned the design of an intended vault, sexpartite, like that in the nave, rising from small shafts, rising from corbels, many of them beautifully floriated; the alternate ones are clustered for the same cause as in the nave and some are shortened by reason of the windows. The want of an upper range of windows on both sides produces an effect of bareness both within and without, and the blind passages in the walls might easily have been made in the ordinary manner in the windows.

Mr. William Imrie, who died recently, has, it is stated, bequeathed 100,000*l.* to the Liverpool Cathedral Fund. The money will not be received until after the decease of his youngest daughter.

CONCERNING BRICKS AND BRICKWORK.—II

AN effort was made by Sir Thomas Browne in the sixteenth century to explain how bricks and tiles contract verticity. If we erect a red-hot wire, he wrote, until it cool, then hang it up with wax and untwisted silk, where the lower end and that which cooled next the earth doth rest—that is, the northern point; and this, we affirm, will still be true, whether it be cooled in the air or extinguished in water, oil of vitriol, *aqua fortis*, or quicksilver. And this is also evidenced in culinary utensils and irons that often feel the force of fire, as tongs, fire-shovels, prongs and andirons, all of which acquire a magnetical and polary condition, and, being suspended, convert their lower extremes unto the north, with the same attracting the southern point of the needle. For easier experiment, if we place a needle touched at the foot of tongs or andirons, it will obvert or turn aside its lily or north point, and conform its cuspis or south extremity unto the andiron. The like verticity, though more obscurely, is also contracted by bricks and tiles, as we have made trial in some taken out of the backs of chimneys.

In the south of Spain, Italy and Portugal it is customary to build walls, &c., brick on edge, and it is very customary to make partitions in rooms by a wall so built. The bricks are 1 inch thick, and being plastered on both sides with good mortar, make a very firm and substantial partition. If two bricks are used it becomes a solid wall.

Early Bricks.

Some early bricks of peculiar size will be noticed in the churchyard wall of Horton, the village associated with the earlier poems of Milton. Those used for the construction of the college buildings of Eton were made in Slough in 1442; then bricks came from Holland. The great monopolist during the reign of Charles I., Sir Nicholas Crisp, is credited with their reintroduction into this country and with having perfected their manufacture after many experiments. Their size was regulated by an Act passed in 1625.

A tablet in Iver Church is worth mentioning in connection with brickmaking:—"Beneath this place lyes interred the body of Venturus Mandey, of the Parish of St. Giles in the Fields, in the County of Middlesex, Bricklayer, son of Michael Mandey, Bricklayer, and grandson of Venturus Mandey, of this Parish, Bricklayer, who had the honor of being Bricklayer to the Honorable Society of Lincoln's Inn, from the year of Our Lord 1667 to the day of his death. He was studious in the Mathematics, and wrote and published three books for Public Good; one entitled 'Mellificium Mensionis, or the Marrow of Measuring,' another of 'Mechanical Powers, or the Mystery of Nature and Art Unvayled.' The third, 'An Universal Mathematical Synopsis.' He also translated into English 'Directorum Generale Uranometricum' and 'Trigonometria,' and some other Tracts which he designed to have printed, if Death had not prevented him. He died the 26th day of July A.D. 1701, aged 56 years and upwards. He also gave Five pound to the Poor of the Parish."

Virginian Bricks.

In the *Century Magazine* for Dec. 1904 Mr. John William Palmer, in his article "Old Maryland Homes and Ways," says that "here stood the sturdy domicile, broad and square, built of bricks brought over from England in the ships that came for tobacco." In spite of the tradition there is not a case to be found in the annals of Virginia of bricks imported from England. It stands to reason that it was easier to import brickmakers than bricks. It seems that brick was made use of almost contemporaneously with the first settlement. The Rev. Alexander Whitaker, who wrote in 1612 of Virginia, said:—"The higher ground is much like the moulds of France, clay and sand being proportionately mixed together at the top, but if we dig any depth (as we have done for our bricks) we find it to be of red clay, full of glistening spangles." In the "New Life of Virginia," published in London 1612, we read:—"You shall know that our Colonie consisteth of 700 men at least of sundrie arts and professions. Being thus invited, here they pitch: the spademen fell to digging, the brickmen burnt their bricks, the Company cut down wood, the carpenters fell to squaring out, the sawyers to sawing, the souldiers to fortifying, and every man to somewhat."

The first brick houses in America made by Englishmen were built at Jamestown, and in August 1637 Alexander Stonor, who calls himself "brickmaker," took out a patent for an acre of land in Jamestown Island, "near the brick-kiln." That the soil on the island was adapted for making bricks is shown by the letter of the Council in 1667, who,

when the king required the fort at Old Point to be repaired, argued in favour of that at Jamestown, "which hath great commodity of Brick Turfe or mudd to fortifye with all."

In 1649 there was printed a little tract called "The Description of Virginia," wherein it is stated that "the people in Virginia have lime in abundance made for their houses, store of brick made, and house and chimnies build of brick and some wood high and fair, covered with skingell for tyles, yet they have none that make tyles, wanting workmen in that trade; the brickmakers have not the art to do it, it shrinketh." Cypress shingles are still preferred in Virginia to clay tile for roofs of dwellings. In the Act of 1662 providing for brick houses in Jamestown, not only are brickmakers mentioned, but the price for "moulding and burning brick." And in the York County Records in 1692 John Kingston, "brickmaker," is allowed 7*l.* against the estate of Robert Booth "for making and burning bricks." In the inventories of dead men's personal property there are several mentions of "brick moulds" necessary in making the brick. There is one record of 100,000 bricks from New England, which came doubtless in response to some pressing demand. The statute for building up Jamestown in 1662 called for "statute brick," which meant brick made according to the English statute.

The Old London Brickfields.

According to the "Annals of Agriculture," by Thomas Baird, 1793, "there is one mode of making use of earth which is probably carried to a greater extent in Middlesex than in any part of the kingdom, namely, in the manufacture of bricks. Some years ago the sum usually paid for an acre of brick-earth was 100*l.*, but the price of this, like that of other commodities, has been rapidly increasing, and, indeed, has gone as high as 350*l.* per acre. The common way now is for the proprietor to get 1*s.* per 1,000, and to receive the ground in a level state, within a foot of the height of the adjoining road, when the brick-earth is completely manufactured.

"The common calculation is that there is one million of bricks per acre in every foot depth of brick-earth (at least, with the addition of the ashes that is mixed with the earth), and, one field with another, that the brick-earth is 4 feet deep. The bricks called 'grey stocks,' for the outside of houses, sell at from 2*s.* to 28*s.* per 1,000, carriage included; common brick for inside work at a guinea.

"Unless the earth with which the ground is filled up is of very good quality, or unless great quantities of manure are laid upon it, some time must elapse before the field recovers its former fertility. There are many who object to such a manufacture being suffered in the neighbourhood of the Metropolis, considering it offensive and unwholesome. On the other hand, it is contended that fire is a great purifier of the atmosphere, and that in close and hot weather a number of brick kilns all round London is of real use to the health of the inhabitants."

A Brickmaking Machine.

In 1891 a new method of brickmaking was invented by Mr. Kennedy, of the United States, and a company was formed to work the patent in this country. The brick-making machine was shown at Southall. The peculiar feature in this mechanical brickmaker is that the clay is used perfectly dry. After being reduced to powder and strained through a sieve, it falls into the hopper of the machine, the coarse particles being returned to the disintegrator to be reduced once more. From the hopper the powdered clay is fed into moulds, and a pressure of 160 tons is then brought to bear upon each. This is equal to about one ton per square inch, and this great pressure is secured by compound levers of the first order. When the bricks so made leave the mould, they are very hard and compact, and they are at once taken away to the kiln to be fired. The machine is automatic, self-feeding and self-discharging, and the work being done under shelter, can go on all the year round without interruption. The machine has an output of 20,000 bricks per day of ten hours.

Is Clay a Mineral?

All metals are minerals, but all minerals are not metals. Although mineral, in the restrained sense of the word, would infer fossil bodies that may be melted, &c., still in the general and accepted sense in present use minerals may be defined as inorganic masses, of which the crust of the earth is composed. Coals are minerals, gypsum is a mineral. There are mineral resins; in fact, earths, stones, metals, fossils of all kinds, come under this general denomination. Clay is an argillaceous earth found in beds

or veins, and although in digging for the same it is perhaps unusual to call the delf a mine, that would not invalidate the classing it as a mineral, more especially as, by a peculiar process, from it is derived that beautiful and now universally known metal called aluminium. To the lord of the soil in feudal times belonged all mines, minerals, diggings, quarries, &c., of what kind or nature soever, and this right is still sedulously kept up by the customs (as recorded upon the Court Rolls) of various copyhold manors wherein this restriction has been perpetually made. Clay, therefore, may be correctly defined a mineral.

Tiles.

After the fire of 1212 in London the roofs of reed or rush, which were then general in the City, were declared unlawful, and were to be replaced with tiles and other materials. In 1245 an order was published by the Mayor that all houses in the principal thoroughfares should be covered in future with slates or tiles. In 1302 Thomas Bat indemnified the City from peril in respect of his property in St. Laurence, Cannon Street, by agreeing to tile the roofs of the premises by the ensuing Pentecost.

In St. John's Street, Bridgnorth, in Shropshire, is an ancient mansion called Diamond Hall, formerly inhabited by Mr. William Hardwicke, the Shropshire antiquary, and built by Roger Pope, an equerry to King Charles II., out of the proceeds of the stakes won by a celebrated horse called Diamond belonging to him. A figure of a horse and rider was placed upon the roof of the house by its builder, and remained there till quite recently.

The public librarian of Plymouth writes March 17, 1883, that he has a good specimen of a ridge tile, which was removed from the roof of a house in that town. The tile is of the corrugated pattern, roughly made, and represents a man in a costume that may have been intended for a cavalier. Both man and horse are roughly made, and somewhat the worse for their two or three centuries exposure to wind and rain. Similar tiles are to be found in Exeter, Tavistock, Totnes, Plympton, East and West Looe. At Exeter the figure is a very noticeable object on a fine old house in the main street. Tradition has it that these curious signs were placed upon the houses in which one of the Charleses was entertained during his visit to the West.

Decorated Tiles.

Two birds back to back, with their heads turned to each other, were common on ancient tiles. The seal of the borough of Chard, in the county of Somerset, has two birds in the above position, with the date 1570.

Painted tiles are set all over the guard-chamber floor in the remains of a castle of the Dukes of Normandy at Caen, and said to have been laid down during the time of William the Conqueror, having represented on them the arms of some of those who attended William in his conquest. In 1786 these were taken up and presented by the Benedictine monks of St. Stephen, at Caen, to Mr. Chas Chadwick, of Healy Hall, Lancs.

In December 1880, while carrying out some works at Fenchurch Street station, a piece of the old Roman wall was met with. The top of the wall, which was 7 feet 6 inches wide, was composed of a bed of limestone walling in concrete mortar about 6 inches thick; there was then two rows of red tiles, extending right through the wall and projecting 3 inches beyond each side of it; below were more layers of red tiles, also extending through the wall. These tiles are 17 inches long, 12 inches broad and 1½ inch thick, are well burnt, still retain their sharp edges and bright-red colour, but are slightly curved; they bear no date or inscription. Inscribed tiles are extremely rare, very few having been found among our London discoveries.

"THE WINTER'S TALE."

THE impending revival of "The Winter's Tale" at His Majesty's Theatre has given rise to speculation about the interpretation. But no less interesting is the manner in which the play will be "staged." The title in relation to the play is in itself a mystery. The winter's tale about the man who lived near the churchyard, which the boy prince of Sicilia begins to relate, stops before the first sentence is concluded. On what ground was it selected as the title of a tragic play? Dr. Ulrici maintains that it suggests the marvellous caprice by which the whole of the events were inspired. According to him, "the sovereignty of eternal contingency gives the play the character of a tale and its title. For pure contingency in its outward, objective form, which as such interrupts the order of nature, the given division of time and space, the causal connection of things,

comes in between like a foreign element." "The Winter's Tale" is therefore a combination of the serious and the fantastic. Time and place are alike disregarded. Bohemia becomes a maritime country; the Delphic oracle is supposed to be of the same age as Giulio Romano, who for the occasion ceases to be a painter and becomes a sculptor. The mirror held up to nature is a distorted one, and the tragic as well as the comic scenes are exaggerated.

With such a play it is no easy matter to decide upon the character of the costume and of the buildings in which the events arise. What was the style of Leontes's palace or the palace of Polixenes? If the architecture could be determined, then the "properties" in general would present few difficulties. But with a play which contained so many references to what existed in England at the beginning of the seventeenth century it is difficult to decide what period is to be expressed. Mr. Tree, it is understood, will make the Sicilian scenes classical, while those in Bohemia will be oriental in character. Few lovers of Shakespeare have given more attention to the subjects of the "Architecture and Costume of the Plays" than the late E. W. Godwin, F.S.A. In one of the series of articles he contributed to *The Architect* on the whole of the plays he deals with "The Winter's Tale" in a remarkable way, which at the present time has renewed interest:—

"That the Classic element in 'The Winter's Tale' is overlapped by English Mediævalism to an extent which is at times startling cannot be questioned by anyone after reading the fourth Act. That quite apart from the introduction of sixteenth-century English country life there are strange anachronisms respecting places and people must be conceded. As, for example, the introduction of the Oracle of Delphi as an integral part of the plot, the mention of the Emperor of Russia as Hermione's father, the presence of Giulio Romano in Sicily as a painter of sculpture, and the existence of a country with a sea-coast called Bohemia, and ruled over by a king called Polixenes. Nevertheless, I am not by any means prepared to say with some readers of this play that it is a comedy quite removed from the sphere of reality. The Italian painter and the Emperor of Russia slip into the text almost unobserved, and but for the picture of the English village festival, together with one or two slight references to costume, we should have a play almost wholly free from anachronism.

"The important part in the plot played by the Pythia, or priestess, of Delphos recalls a time anterior to 371 B.C., when the oracle was popular; the names of the *dramatis personæ* are Greek down to the names of the shepherdesses and pedlar, and the state of society, divided as it is between two classes—the aristocrat and the labourer—might take us back even to the heroic age. Then for 'Bohemia' I would venture to read Bœotia, and so get rid of the geographical difficulty. Finally, as to the English character of the fourth Act, we may bear in mind that a shepherd's life was very much the same in the heroic age as it was in the Elizabethan or any other age; and that the Bœotian poet Hesiod, in the 'Works and Days,' gives us pictures of a simple country life very little different from those given us by the English poet in 'The Winter's Tale.' We have, therefore, to choose some date before 371 B.C. for the period of the action. I say 371 B.C., because after this time the Delphic oracle had so far lost its hold upon the public faith, and its old towering influence had been so much reduced by the exhibition of manifest favouritism, that it would hardly have attracted a colony so far removed as Sicily. Nor, on the other hand, must we venture to go too far back, for fear we reach an art period wherein the extremely realistic painted statue as we have it suggested in the play would have been impossible—impossible to the first or Archaic period as a matter of course, impossible to the second or Ideal period (464-32 B.C.) as a matter of art, which artists at least can readily understand. It is to the beginning of the naturalistic, or third and last, period of Greek art (430-7) that I would refer the action of 'The Winter's Tale'; and thus it comes to be bracketed with 'Timon of Athens,' which is really a Greek history, Timon, the misanthrope, and Alcibiades, the general of the Athenian forces, being prominent names in Athenian history from 422-4 B.C.

"The architectural scenery in 'The Winter's Tale' is Sicilian, and includes

1. A street scene (before the palace).
2. A room in the palace of Leontes.
3. The outer room of a prison.
4. A court of justice.
5. A room in Paulina's house.

The palace of Polixenes appears once only in the short opening scene of the fourth Act, but this scene might just as well be a country road or a garden as a palace. The five scenes above enumerated may be reduced to four without doing the slightest violence to the text, and without incurring any archaeological improbability, by uniting Nos. 3 and 4, so making the court of justice serve for the second scene of the second Act. Nor would it be very difficult with careful attention to the planning and setting of the scene to reduce the list still further by uniting No. 2 with 3 and 4. Now, although the period of the action belongs to the naturalistic, or last style of Greek art, it is necessary to remember that a Classic city, as a rule, was not necessarily built in one day and in one style any more than a Gothic town was. That just as London and York, Coventry or Bristol in A.D. 1430 exhibited buildings of a variety of dates up to the purest work of the thirteenth century, and beyond that to at least the middle of the twelfth century, so in Agrigentum for a century and a half, and in Leontini and Syracuse for three centuries, the builders' hands had been busy before Polixenes came on his unfortunate visit to Leontes.

"But whatever variety existed in the proportions of column and entablature, whatever changes and refinements were developed under the indubitable art-culture of the Sicilians, Doric was the prevailing character of the architecture. On public buildings like the temples and palaces, colour, gold and varnish were lavishly used outside as well as inside when the work was of porous stone and stuccoed, but they were perhaps applied in less quantity when the work was of marble. M. Hittorff, who in 1823-4 travelled in Sicily in company with the German architects Zanth and Stier, tells us that the body of the walls was painted a pale golden yellow, the triglyphs and metules blue, the metopes and tympanum red, and on some parts were traces of green, all used in various degrees of intensity. Other antiquaries tell us that "the white marble never remained naked," and that even the portions intended to be white received a transparent coating, that the blue used was of a grey opaque character, that the red was transparent, and that the green was very delicate although bright. The streets were narrow, and were paved with irregular polygons or blocks of stone, and every building was *not* exactly a repetition of a peristylar temple. Indeed the majority of houses appear from Aristophanes to have been very deficient in their internal arrangement, and to have been built on very limited plots of ground. There seem to have been no sanitary provisions of any kind, and the poultry lived, Irish fashion, in the room where the beautiful Myrrha carded her wool or plied her distaff. The roofs of many of the houses were flat, and thither the women retired, some to indulge in wine, some to mourn for Adonis.* The Nestorian house, illustrated in Layard's 'Nineveh,' may be taken as giving a fair idea of the general appearance of the common class of Greek tenements. But, again, a Greek town was not made up wholly of the lower class of dwellings any more than it was of temples or palaces. In the 'Thesmophoriazusæ' and 'Ecclesiazusæ' we meet with residences of more than one storey where, too, the women of the house have a distinct suite of rooms to themselves, where some of the upper windows look into the street, and where bay trees and statues shade the entrances. Still, with the extension of plan and increase of means here indicated there was scarcely any addition to the walls in the shape of architectural detail. Nor did the ordinary domestic building of Greece partake of anything like what we understand by the words architectural style until a hundred years after the time now under our consideration.

"The difference between the houses of the lower and the upper classes was one depending chiefly on size, solidity and paint. The palace of Leontes towards the street might be represented as a massive stuccoed wall of two storeys covered with painted decorations and pictures, pierced above by plain square windows with folding shutters, and below by a wide and lofty doorway set in a frame of Doric antæ entablature and triple step-raised threshold. The doors themselves should be folding, with framework of plates of bronze studded with gold, two large golden rings used as knockers and numerous square panels filled with ivory bas-reliefs, painted and gilded and backed by bronze or wood. Before the antæ might be placed marble statues† of Apollo and Hermes, and before these,

* Lysistrata. See also Ezekiel, chap. 8.

† Statues in the open air had "meniskoi" or metal discs above the head to protect them from falling matter.

and by the side of them, the bay and the laurel, with marble seats beneath them, extended avenue-like to the line of the street.

"The interior or room of the palace might be either the 'aule' or peristyle, the open part covered with a linen velarium, or a hall arranged on a theatre-like plan. Such an addition to a royal palace might be unusual, although not impossible, for the half-circle was a form of ground plan by no means limited to the uses of the drama. But whichever plan may be selected, there must be no lack of imagery portrayed upon the walls round about—amber colour and ivory, bright red and gold, grey blues and silver, tender green and bronze may all be there. There too we may have curtains of the rich Tyrian purple, covered with embroidery in gold, white and red. The wall-paintings might be arranged in two or three rows, the lowermost level being some four or five feet from the floor. The subjects would be taken from the stories of gods and heroes—Aphrodite's envy of Psyche, or the labours of Hercules; how Jason won the guarded fleece of gold, or how Theseus escaped the labyrinth—whilst some rooms would be wholly given up to the story of the siege of Troy or the wanderings of Odysseus. But unfortunately such scenery as that of the kind here suggested is practically impossible in this generation. We may have artists equal to save the work from being ridiculous, but no manager would be mad enough to pay for it, while actors and actresses work from low motives, are sand-blind to art, and therefore utterly incompetent to act in the poetical drama.

"Paulina's house would of course be very inferior to the royal palace, and yet we must remember that the text indicates a place of refinement, a house where art was honoured, where sculpture was at home, and where the latest and best work was enshrined god-like within a tabernacle, tent, curtain or velum. These curtains were movable in three ways, either by being drawn aside, by being lowered to the floor, or by being raised to the ceiling. They were either of fine wool or thick linen, and some were sumptuous in wealth of lovely colour and woven figure. An open or half-open gallery or corridor, the roof resting on squared posts of timber or masses of stuccoed masonry, statues on cylindrical pedestals, a wall with a painted band or two of ornament, a recess for Hermione, and a general amberish tone of colour over all are the chief ingredients for this scene.

"And now turning to the *costume* of B.C. 430-7, I confess I am troubled, not for want of authorities but through excess of them. On marble, vase, coin and gem are the illustrations which the old Greek has left us of the written word. This last tells us of women decked out in the feminine yellow or saffron-coloured chitons over loose Cimmerian transparent chemises, or chitonians of fine linen, with girdles round the waist and sandals on the feet. An outer garment and a cloak, or himation, was worn over the chiton, the latter usually at night and in cold weather. Besides these, mention is made of Persian slippers, veils (shawl or peplos), parasols, small mirrors suspended from the girdle, rings, necklaces, gold ornaments, paints and unguents for the skin, the head-dress, the head-band, and the caul or net cap worn also at night. We are told of the hair of some women being cut bowl-fashion, of that of others being loose and flowing. As to the men, we learn that they wore a linen shirt, a chiton, girded, shoes, and in winter a cloak and boots, and that they wore the chaplet of flowers received at dinner throughout the evening, although they might be going to other houses. The colours most usually employed were the Tyrian purple, the Sardian red, soft whites, tender greens and dark blue-greys.

"It is somewhat strange that, considering the abundance of illustration in the British Museum alone, a Greek dress has yet to be made; for neither in the numerous (attempted) Classical costumes of the stage, nor in the paintings of Classical subjects publicly exhibited, has a Greek tunic or chiton been fairly represented. It is quite impossible without the help of drawings to fully explain the different shapes of and modes of wearing this the chief article in a Greek wardrobe; but it may be noted—(1) that fineness and closeness of texture in the wool is essential; (2) that fulness of material so as to secure a multitude of folds is equally necessary; (3) that the gigantic key and wave borders we have been accustomed to see on the English stage have nothing to do with Greek work of the time of Alcibiades; (4) that the decoration of the dress was effected by double lines and dots arranged vertically in the centre of the front of the chiton as well as by border lines; (5) that there were sundry kinds of girdles ranging from the

simple string tied in a large bow at the front or side to the broad metal zone tied or clasped; and (6) that there were two distinct kinds of chiton—one single bodied, and the other compound or double bodied (called 'diplois'), which consisted in the chiton being much longer than the person, the extra length being doubled over, and falling over the front and back as low as the waist or lower. Besides these common forms of the chief dress we meet with illustrations of over dresses reaching some distance below the waist, and girded. Some of these have short shaped sleeves, and some have long, loose, or bag sleeves. Another form which has the appearance of a sleeve is nothing more than the upper extensive hem of the chiton dropping over the upper arm, and looped up by one, three, four, five or six buttons. For the Greek chiton was formed of a square cut piece of wool, and was as broad or broader than it was long. When, therefore, the dress was not looped over the arm, it hung from the shoulder button in an open fold under each arm, through which might, perhaps, occasionally be seen the delicate chemise or vest beneath. The borders were usually enriched with single lines, sometimes dots set close together were added on one or both sides of the line, and in the richest examples double lines occur, the upper band thus formed enclosing embroidered figures—the marginal one decorated with conventional leafage.

"Various, too, was the arrangement of the women's hair, as also the designs of their head-dresses. Some of these were extremely beautiful, others, again, look awkward, not to say ugly, if such an objectionable word may be allowed in connection with anything Greek. The bracelets were chiefly of gold, made in the spiral form. Necklets were mostly of beads or pearls, which were also used for the head-dress, for neck-chains and even girdles. The peplos or shawl, and the chlamys or scarf, were worn out of doors. The first of these was a very capacious sort of wrap, and was often used as a cover to choice furniture. It was usually worn round the body, the end being thrown over one shoulder and falling to the bottom of the back. The scarf was sometimes made in an oblong piece, the length equal to twice its width, and sometimes with triangular goars or wings added. The chiton and chlamys were worn by both sexes. I might go on exhausting the patience of my readers with descriptions of the different methods of wearing the scarf, and of many other modes and details of dress, but if anyone is anxious to learn more they have but to devote a spare day or two to the British Museum, or if this is not within their reach, Hamilton's 'Vases' may be consulted.

"And now, after one has been wandering in museums and noting ancient Eastern authors, it is quite a refreshing change to come home once more and to turn to the notices of costume in the text of 'The Winter's Tale.' Hermione's words—

You may ride us
With one soft kiss, a thousand furlongs, ere
With spur, we heat an acre,

introduce us at once to a period wholly different from the time of Alcibiades. As we go on we hear of the day when Leontes saw himself unbreech'd in his green velvet coat, his 'dagger muzzled lest it should bite its master, and so prove, as ornaments oft do, too dangerous.' Hermione wears 'a medal,' also called 'a jewel,' hanging about her neck, a fashion we see illustrated in many of the sixteenth and seventeenth-century paintings. Paulina is persuaded of the clown's truth by recognising her husband's handkerchief and rings. And lastly, in the fourth Act, mention is made of 'three pile' (velvet) and of a host of Elizabethan millinery, 'ribands of all the colours in the rainbow,' points or tags, inkles, caddisses, cambrics, lawns, tawdry lace, tape, silk, thread, sham jewels, brooches, pomanders, shoe-ties, and

Gloves, as sweet as damask roses;
Masks for faces, and for noses;
Bugle bracelet, necklace-amber,
Perfume for a lady's chamber:
Golden quoifs, and stomachers."

The Cistercian Abbey of Hayles (Glos), where Richard Earl of Cornwall and his son Henry (murdered at Viterbo) lie buried, is being excavated for the owner by Mr. St. Clair Baddeley. The excavations, which successfully recovered the plan of the abbey church and chapter-house in 1900, promise to recover that of the frater, kitchen, dormitory and infirmary.

THE EMPLOYMENT OF COLUMNS.

THE primary and most obvious office of the column is the support of a horizontal superstructure for the purposes of shelter. Hence its use in the portico and external peristyle of the Greek temple, and frequently also in its exterior. None, therefore, will dispute the significance and decorative fitness of the column where thus applied to porticoes, colonnades or interiors as characteristic of utility and necessary support. In this manner of use we premise the employment of unbroken entablatures and regular intercolumniations. But are we to be restricted to this? Is there no significance or propriety in the use of the column under combinations less primitive and rules less severe? In the internal introduction of arches and vaulting instead of the horizontal superstructure for shelter are the column and entablature to be necessarily discarded? Certainly not, unless we would sacrifice almost all the beauties of Roman and Italian composition to that ill-supported hypothesis, popularly adopted from Vitruvius, which makes the column and entablature to be mere representations in stone of the props and roof of the primitive wooden hut. For, unimportant as the question of the origin of these members may at first sight appear to be, it is well worthy of our careful notice that the admission of this hypothesis of Vitruvius is fatal to the consistency of expression in detail of almost every ancient or modern work of importance. Even the structures of Athens will not be found faultless on this supposition; for the scheme of timber construction can never justify the conjunctive use of a complete internal and external entablature, as in the case of the peristyle and cell of the Parthenon and many other edifices. On such a supposition our imagination must be constantly haunted with the idea of the repetition of roofs on the inside of buildings, and even about their doors and windows. But reject this notion, and consider the entablature under its most obvious character, not as representing a wooden roof, but as being and representing honestly a platform of stone, raised for any specific purpose, primarily, indeed, for that of shelter, and the whole difficulty thereupon disappears, supposed incongruities vanish, and significance and fitness are, in many instances, recognised in the place of misapplication and confusion.

This point, then, being admitted, we shall be prepared to see that the use of columns and entablatures does not necessarily render a surmounting arch or vault inappropriate; that, for instance, two parallel lines of columns, with continuous entablatures, may fitly be united by a vaulted covering. But suppose, further, a somewhat similar arrangement to be that of the nave of a modern church, in which, however, the smallness of the regular intercolumniation is a matter of objection on account of the obstruction caused by numerous columns, and instead, therefore, of continuous entablatures on each side, a succession of arches is made use of from column to column, surmounted by the general vaulted ceiling; at the same time the decoration of columns or pilasters must be continued round the extremities, east and west, with a regular entablature. We then are under the necessity of employing over each column a square piece of isolated entablature, to preserve a correspondence of lines round the whole interior, a combination of which we find constant examples in the churches of Wren and subsequent architects.

This particular arrangement is, by many persons, pronounced to be a great abuse; but with such an opinion we are not prepared to coincide. For the truth is, that the introduction of the arch and vault, in this and similar instances, entirely sets aside the importance of the entablature as the member of support, superseding it in efficiency for all large intercolumniations and leaving to it only those smaller intervals which may be within the usually admitted limits. On the other hand, to avoid such a discontinuance of the entablature when arches are employed over columns, the only alternative would be to omit it altogether and to let the arches spring immediately from the capitals. To this, however, there is the greatest ground of objection, inasmuch as the inseparable connection of the column with its entablature is a point of fundamental importance to the preservation of the identity of Classical architecture, to neglect which is to wander at once into those mazes that terminate in the Moorish or in the Norman style: not to notice further the naked and unsatisfactory appearance of a column so employed, as contrasted with the same member under every other application in colonnades and porticoes; nor yet to insist on the fact that one of the Roman orders,

the Doric, is essentially incomplete without its entablature, the triglyph of which alone gives a denomination to the column.

In saying this we wish to show that the supposition of the invariable importance of a continuous entablature which has been derived from the study of Greek works is not of universal adaptation to that complex system in which the arch obtains so conspicuous a place. There are occasions in internal arrangement in which the arch, as the substitute for the entablature over large intercolumniations, greatly exceeds it in value and efficiency; occasions when the latter could not be carried out and applied to the same office without manifest inconsistency, and, indeed, false construction. Occasions, therefore, in which the expression of utility requires a broken entablature as subservient to the arch. But even in these cases the object for which a continuous entablature would be desirable, viz. the connection of horizontal lines, is not to be lost sight of; for, in the instance before supposed, of a row of columns and detached entablatures connected by arches, the whole ought to be surmounted by a larger cornice than that of the entablature, previously to its receiving the general vault, as instanced in the clerestories of some of our churches. A groined ceiling, instead of the arches and vault, would be wanting in character, since this would preclude that connection by means of a general surrounding cornice. Of course, the license for which we plead, in the occasional management of arches, applies principally to the composition of interiors; it cannot in external design be extended to the sanction of such an abuse as that of the interruption of a general entablature for the admission of an arch, where there is no superior cornice above to connect the whole, while, on the other hand, it may offer sufficient apology for the practice of using a subordinate order, with discontinued entablature, in such instances as those of Venetian windows, so common in the designs of the Palladian school.

Having so far noticed the twofold employment of columns for the purposes of shelter, on the one hand, by the support of continuous entablatures and horizontal coverings, and, on the other hand, by the support of arches and vaultings, to which the entablature then becomes subordinate, let us for a moment observe some inferior examples of such combinations for the same ostensible object. As one of these, we sometimes see a portico or colonnade made use of not to protect and designate an entrance, but as a mode of decoration to windows. How far, it may be asked, on the principle of utility, is this justifiable? When such an appendage has sufficient projection and arrangement to render it really available as a place for walking in shelter, it is undoubtedly appropriate, having the use of a verandah combined with an architectural character which that class of erections can never possess. When, however, its projection is insufficient for this object, the columns being placed, perhaps, as close as possible to the wall in which the openings occur, the only principle of utility upon which it can be admitted is that of affording protection to the windows in the same manner, though to a greater extent, as an ordinary window dressing is professedly made to do. It is only upon the same supposition, indeed, that we can recognise any practical fitness in the use of engaged semi and three-quarter columns. For it must be allowed that the employment of the column in this attached mode is defective in point of significance, countenanced as it is, nevertheless, not only by the frequent practice of modern architects, but by examples from antiquity.

The application of columns to windows and the frequent use of engaged columns are matters that often stand associated with another circumstance of practice which demands notice, viz. the employment of orders upon orders. This practice does not deserve sweeping condemnation, since there are many considerations that render it justifiable, at least occasionally. It is true, indeed, that two orders, of which one is placed upon the other, are not in the abstract equally imposing with one order of their united heights, and that such an application as the former constitutes a departure from the example of the best (though not of all) Greek remains. But neither of these circumstances is a sufficient objection, since, in the first place, the column is not in composition to be considered alone, but in connection with accompanying features, especially in reference to the apertures; and, in the second place, those apertures are with us subjects of much more importance and deserving of more concession than they were in the climate and temple architecture of Greece. If, then, in the decoration of a façade of several storeys we

would preserve to the windows that prominence of character which the expression of utility imperatively demands, we must limit in proportion the size of the columns with which they are associated, never allowing the height of the latter to include more than two tiers of ordinary apertures, or one tier of such apertures as may be large enough to require a wide intercolumniation. If this limitation be exceeded, the window not only loses its proper character, but is deprived of its internal efficiency on account of the extreme width of the intermediate piers required by larger columns. This restriction, then, in the height of an order so employed, will render it advisable for the decoration of the supposed remaining storeys to introduce sometimes a basement, sometimes a second order and sometimes both together, as in the banqueting-house at Whitehall and the exterior of St. Paul's. Nor are the character and office of the column and entablature, if rightly considered, at variance with such an application. On the Vitruvian hypothesis of their origin, this practice would, indeed, involve the absurdity of representing as many roofs as there are entablatures, or even cornices, in the height of a front; but upon the supposition that the entablature expresses simply a platform of stone, there is discerned a manifest significance rather than an abuse in thus marking the division of storeys by the use of successive orders. Of course such fantastic display as that of piling the five orders one upon another is not to be commended; but the practice of supercolumniation as resorted to by masters of the Italian school is capable of justification. Those masters acted in the true spirit of art in thus modifying and applying the systems of antiquity to their own altered wants and circumstances.

Besides the various employment of the column in such cases as those already adverted to, where the obtaining of shelter is the professed object, some other purposes for which it may be used should be noticed. Of such purposes probably the next in importance is that of the definition of boundary. Thus, wherever a screen or fence wall does not need continuous solidity we may consider a columnar screen capable of application in its stead, without any opposition from the principle of utility; a consideration which will extend to the decoration of gateways and park entrances. Closely connected with this subject is that of the embellishment of archways upon the model of the triumphal arches at Rome. Here, too, the utilitarian principle may justify the employment of the column, though upon another and a third ground, viz. that of presenting support to essentially characteristic parts of the composition. As applied to a triumphal arch, the column would have no significance as a means of obtaining shelter or of defining boundary; it has, however, sufficient import and character as a means of support to so essential a feature as statuary. Hence in the Arch of Constantine there is a reason not only for the use of columns, but even for what would under other circumstances be objectionable, an entablature broken round the columns; since the office of each column is specifically the support of its statue, and since, too, the entablature could not, with an expression of propriety, be carried unbroken across such wide intercolumniations as those caused by the arches.

Lastly, the application of columns to structures whose principal end is that of ornamental effect should be noticed. It is obvious that the application of the principles of utility is not more strictly necessary for the management of detail than for the purpose of the entire composition. This consideration, indeed, might have disposed of objections on the ground of superfluity in the decoration of the triumphal arch. It is a consideration also which will apply with much force to the composition of steeples; objects in which, after all allowance for the demands of a belfry, the chief purpose desired is that of designation to the eye. Here, then, it is idle to look for any further recognition of utility in the use of columns than that which relates to fitness of effect, subject always to the expression of constructive practicability. Members, elsewhere superfluous, are here appropriate if they promote a characteristic tendency of lines and a progressive lightness of ornament. Here also the preservation of unbroken entablatures is not to be enforced, since the effect to be attained is directly the reverse of that which is appropriate to elevations of the ordinary lengthened form, whose prevailing lines are horizontal, and wherein, therefore, the entablature must be continuous and uninterrupted by needless angles. On the other hand, it is the object in steeple composition to counteract that predominance of horizontal lines so incident to the Classical styles of architecture, and

to substitute for it a vertical and aspiring tendency of form, which, of course, can only be preserved by multiplying the perpendicular and breaking the necessary horizontal members so as to lead the eye imperceptibly upwards from storey to storey. A due consideration of this object may also lead us to view with indulgence the numerous breaks of entablature so common in the Palladian school of design, when they are found to occur in elevations of more storeys of orders than one, and in which the height may be unusually great in proportion to the length of frontage.

GENERAL.

Mr. James Dredge, C.M.E., civil engineer, died at Pinner, in his sixty-seventh year, last week. He was joint editor of *Engineering* since 1870. Mr. Dredge had been officially connected with most of the universal exhibitions, including that of Vienna in 1873, the Centennial Exhibition at Philadelphia in 1876, and those of Paris, 1878 and 1889. At the Chicago Exhibition of 1893 he was a member of the British Royal Commission, at that of Antwerp in 1894 a member of the British committee, and at the Brussels Exhibition of 1897 was Commissioner-General for Great Britain.

Mr. J. Reid Murray, a Glasgow artist, died at Prestwick last week after a long illness. Mr. Murray, who was a native of Helensburgh, studied in the schools of art of both Glasgow and Edinburgh, and afterwards worked for three years under Verlat at Antwerp.

The Clerk to the London County Council (Mr. G. L. Gomme) has addressed a letter to the metropolitan city and borough councils on the subject of the constant disturbance of London streets by companies and others having the legal power to break them up, inviting the support of the councils in bringing about a remedy.

Dr. Tristram, E.C., heard an application for a faculty for alterations and improvements in Hillingdon Church. The Chancellor, in delivering judgment, said the alterations proposed to be made in the church would be a decided improvement. The most important was the making of a better exit from the west end. At present the exit at the west end under the tower was very inconvenient, and in case of fire or any alarm it really might be dangerous. That was one reason why the court was held to hear the application for the faculty. The London County Council had reported that in very many cases there was no safe exit from many of the London churches in case of alarm.

M. Ballu, the French architect who has revealed the Roman city of Timgad to tourists in Algiers, has been fortunate in discovering treasure trove in money and jewels at the site of Lambese between Timgad and Babna.

A National Housing Conference is to take place in connection with the Trade Unions Congress in Liverpool during the first week in September. It will be held on the Saturday preceding the Congress and has been promoted by the Workmen's National Housing Council and the National Housing Reform Council. Mr. D. C. Cummings, president of the Trade Unions Congress, will be in the chair. The conference will advocate the conferment by Parliament of greater powers to local authorities and urge a more enterprising and effective use by local authorities of the powers they already possess for insuring the better housing of the people.

The Transvaal Education Department invite designs for the erection of a Johannesburg college and a high school at Jeppesstown, at a cost of 12,000*l.* for each building. Premiums of 100*l.*, 75*l.* and 50*l.* are offered for three selected designs for each building. Designs must be lodged with the chairman of the tender board not later than September 22.

The Government have not been able to accept the collection at Florence offered to the nation by the late Mr. Stibbert owing to certain conditions imposed by the terms of the legacy. Under the will the bequest will therefore pass to the Commune of Florence, and it will be open to the public on the same terms, and preserved in the same manner, as if it had been held by the British nation. Mr. Stibbert stipulated that the collections were to remain unaltered. They are estimated to be worth 250,000*l.*

Henley Bridge is showing signs of a settlement of the piers. It was erected 120 years ago, and then provision could not be made for the passage of traction engines, &c.

The Architect.

THE WEEK.

THE dinner in Dublin of the Federation of Master Builders received attention from politicians on account of the veiled utterances of the Irish Under-Secretary, which were interpreted as meaning some measure of Home Rule for Ireland. There is now a belief that an experiment of the kind will be made, and that popular favour will be acquired by the purchase of the building in Dublin, now used as the Bank of Ireland. Everyone knows the building was erected in the eighteenth century as a Parliament house. But before it had become venerable it was turned to other uses, as the Lords and Commons of Ireland ceased to have a separate existence from the time the Union Act was passed within the walls. It is a very large structure of admirable design, especially when it is remembered that the exterior is mainly a screen, for although there are doors, it is without windows. THACKERAY said of it:—"In the Bank may still be seen the room which was the House of Lords formerly, and where the Bank directors now sit under a clean marble image of GEORGE III. The House of Commons has disappeared for the accommodation of clerks and cashiers. The interior is light, splendid, airy, well-furnished, and the outside of the building not less so." The prestige of the new Council would be lost if any attempt were made to accommodate the Bank within the building. The Bank of Ireland Company will therefore have to erect new premises, and in a style which will uphold the character of their former accommodation. It is not unlikely that if the change is made as foreshadowed by the Under-Secretary a mighty impetus will be given to building in Dublin, where work of the kind is greatly needed.

THE Manchester education committee have settled the claim of Messrs. SPALDING & CROSS, architects, for work in connection with the School of Technology. It was agreed that the sum of 1,000 guineas should be paid under the direction of the town clerk "as extra remuneration and in full settlement of their claim under the agreement dated February 23, 1893, or otherwise, in connection with the school or the fixtures or fittings therein." One member objected on the ground that when architects exceeded their estimates they got extra payment, instead of being penalised for what he called their "inexact calculation." Sir JAMES HAY, the chairman, said the agreement was that the architects were to receive 5 per cent. on their own estimate of the cost, and that nothing beyond that should be paid except at the option of the committee. The architects in this case had received, with the sum now to be paid, 1,700*l.* in excess, but the gross amount of their receipts was far under 5 per cent. of the total outlay on the school. From this it will be seen that instead of receiving more than the sum to which they were entitled, Messrs. SPALDING & CROSS have gained much less than the ordinary fees.

It was lately announced that the Town Council of Birkenhead intended to adopt a scheme by Mr. G. F. DEACON and to obtain a new water-supply from a source in Wales. It would now appear that the scheme was only of a diplomatic character, and was introduced in order to induce the Liverpool water committee to supply Birkenhead on more economical terms than had been proposed. The terms originally stated were that Liverpool should take over the mains, towers, reservoirs and other property connected with the Birkenhead water-supply, and that the price paid to Liverpool for water should be 6*d.* per 1,000 gallons. It would be also necessary that Birkenhead should lay down mains from Delamere Forest, the point of connection with the

Liverpool works, to the town without any expense to Liverpool. The terms were not thought to be acceptable, and then Mr. DEACON'S project was put forth. The result was that new proposals came from Liverpool, and terms are offered which correspond with those arranged between Liverpool and Bootle. Liverpool is to construct the connecting main at a cost of about 130,000*l.* The debt of Birkenhead at present amounts to about 18*l.* 4*s.* per head of the population. But an independent water supply would increase the debt to 24*l.* 19*s.* per head. There was some hostility to the new proposals. But thirty-three members of the Corporation have voted in favour of them, while there were only ten opponents. We have always stated that the Government should interfere, and determine the area of water supply for different towns. Liverpool has an excessive supply, and the same may be said of Manchester and Birmingham. By monopolising the most productive sources in the country the claims of the Metropolis have been disregarded, and a difficulty has been created which before long will have momentous consequences.

THE late STANFORD WHITE, like many other men, was not free from frailties, but his fellow-architects made allowances for them. He evidently possessed qualities which endeared him to those who were his rivals. The following tribute has been offered to his memory by the architectural societies of New York:—"The executive committees of the New York Chapter of the American Institute of Architects, the Society of Beaux-Arts Architects, and the Architectural League of New York desire, in the name of their respective societies, to express their sense of the great loss which the profession and the art of architecture have sustained in the death of STANFORD WHITE. His quick and generous appreciation of all that is beautiful, even beyond the field of his immediate profession, was so genuine that the influence of his work will long continue to be a stimulus to the artistic development of this country. Only those of us who have been closely associated with him professionally can fully appreciate the love and enthusiasm with which he devoted himself to art. His was a commanding personality, and whatever he produced had the touch of genius."

IN 1727 LOUIS XV. ordered that the road between Paris and Fontainebleau should be altered and improved in the neighbourhood of Juvisy, where accidents occurred. According to an inscription, it was necessary to rend the rocks, to level a hill, to construct a bridge and much else in order to improve the route: "planam, rotabilem, et amoenam fieri curavit." The bridge which crosses the river Orge, one of the tributaries of the Seine, is a remarkable work. It goes by the name of Pont des Belles-Fontaines, because in removing the great masses of rock a spring was tapped which was utilised by constructing a pair of fountains on the parapets. As was to be expected in designing them, they were made to subserve as memorials of the king. One was formed as a trophy with a group of children supporting a globe which bore the arms of France. The group on the opposite parapet shows Time holding a medallion of LOUIS XV. and trampling on Envy. Both were the work of the younger COUSTOU, the sculptor. NAPOLEON observed them in his journeys from Fontainebleau to Paris and had the figures restored. In fact, it was quite close to the fountains that he first heard of the capitulation of Paris. Since his time they have been neglected. COUSTOU'S figures have lost their beauty, for it was a rustic amusement to pelt them with stones, and the inscription is illegible. But the bridge, which may be said to consist of two storeys, is as secure as ever. There is no similar work in all France, and some lovers of the past are now endeavouring to persuade the Government to spend money on the restoration of the figures.

ALFRED STEVENS.

THE esteem which artists in general and many Parisians felt for the late ALFRED STEVENS, the painter, who died on Friday last, was shown by the selection of his name to designate a short street or *impasse* in Paris. It is in the artists' quarter near the Place Pigale, and was intended mainly for the habitation of painters. The shrewd speculators owning it knew that no name was to be discovered which could be more attractive, or more likely to suggest elegance in the apartments. ALFRED STEVENS was, however, a Belgian, who was born in Brussels in 1828, but when he was eighteen or nineteen he went to Paris. He was fascinated by it, and a great many of the inhabitants were in turn fascinated by him. He was what is called "a man's man," and he could not pass along the boulevard without being stopped at almost every step by friends who were glad of even a moment's conversation with so admirable a *causeur*. To the close of his life his figure was striking, and he was easily recognised amid a crowd of *viveurs* in a restaurant. In his old days he must often have thought sadly of the joyous time he shared when the Empire was young, and when he was able to hold his own with the best talkers and wits Paris could produce. As a painter his merits were admitted without any envy by the ablest among his contemporaries. In a word, ALFRED STEVENS was treated as if he were a Frenchman, and by artists who differed from one another except in their appreciation of him.

His father was an officer in the army; but as he was fond of pictures both his sons were allowed to work at the Brussels Academy under FRANÇOIS NAVEZ. JOSEPH, the elder, became an excellent animal-painter, and one of his paintings was in the last Guildhall exhibition. While ALFRED was a student some of his works were seen by CAMILLE ROQUEPLAN, the French painter, who easily persuaded M. STEVENS to allow the youth to study in Paris at the Ecole des Beaux-Arts. In 1849 ALFRED STEVENS exhibited in Brussels his *Soldier in Trouble*. It may be remarked that originally he did not appear to be destined to become the painter in chief of feminine life, for his subjects were sometimes of a kind that would now be called sensational. It might even be supposed that his brother JOSEPH would be more successful. ALFRED obtained, however, a first-class medal in Brussels in 1851 and a third-class in Paris in 1853.

The Paris International Exhibition of 1855 afforded him a great opportunity. He was then living in that city, and he sent half a dozen paintings. Some critics were able to recognise his ability as a colourist. One painting was a figure of a Moor seated on a rock; two were costume pieces. There were two works which suggested the line he was best adapted to follow. One represented a young girl pawning her diamonds—apparently in order to oblige a friend—the other, which gained some notoriety, had for title *What is called Vagabondage*, and depicted the arrest of a poor woman with a baby on a winter's day with the snow falling, and who is being conducted to the police station by several agents. ALFRED STEVENS's pictures were so much talked about he must have obtained more than a second-class medal if such awards did not follow a regular gradation.

Soon afterwards, though he did not often make them the subject of doleful paintings, ALFRED STEVENS devoted himself to the representation of woman's life under the new conditions. Imperialism had given an impetus to luxury. The semi-Puritanism of the Orleanists had passed away. Men became celebrated as dressmakers, and artists received high prices as designers of gowns. ALFRED STEVENS's paintings expressed the spirit of the time, and may therefore be taken hereafter as supplementing or illustrating what will be recorded by historians about the influence of the Imperial Court. One proof of his success was to be seen in the award of a first-class medal at the

International Exhibition of 1867. He received a similar distinction in 1878 and in 1889 he was awarded a Grand Prix of the Universal Exhibition. He entered the Legion of Honour in 1863, was made an officer in 1867 and promoted to the rank of Commander in 1878. In distinctions he stood on a level with the most valued of his French contemporaries.

Although his works were so much admired, ALFRED STEVENS could not in his prime be considered as a very productive artist. His best pictures generally represent no more than a single figure, and often he avoided full lengths. They were carefully painted, although their treatment is not suggestive of great labour, and with all the breadth of the handling he was careful in suggesting every characteristic of the fashion of the moment. It was probably owing to their fidelity to temporary fashions that after a time the paintings of ALFRED STEVENS did not compel the attention and admiration which originally were given to them. The prices fell, and the painter, for whose smallest work amateurs and dealers contended, confessed to a friend that in the course of nine months he was compelled to produce seventy-five pictures. To a man whose thoughts for many years were concentrated on the luxurious life of worldlings the compulsory obligation to toil like a galley slave in order to meet the demands of common everyday life gives an air of tragedy to the latter years of the artist.

His works are likely to be valued hereafter not merely for their representation of the costly costumes of the nineteenth century, but for suggesting the peculiar relations between men and women in France at that time. The "Ewig-Weibliche" became to Frenchmen a problem which was solved in a manner which differed from that of the German or the Briton. It corresponded, however, with what was to be found in French poems and novels. His fashionable women might not be driven to a cell by three or four policemen, but they seemed to be all either deserted or doomed to be deserted by those who should be their protectors. One of his paintings represents the conclusion of a masked ball in the dawn of an Ash-Wednesday, when the gaiety had become vapid. That was only a more emphatic expression of the idea latent in other works. He never cared to suggest, like DA VINCI, that woman was a sphinx, but the majority of his figures hint that women are destined to be victims by fate, and that one time or another the impending tragedy is as inevitable as gravitation.

Instinctively, Englishmen and Englishwomen must have realised the mystery which brilliant colours could not conceal in his paintings. That, we suppose, is the reason why so few of his works are to be found in English collections. If we remember rightly, not one of those by ALFRED STEVENS in the last Guildhall Exhibition came from an English house. And yet it must be allowed that in technique many of his paintings merit high praise. A painter's work should always compel us by a kind of magnetism to feel the degree of power employed in its production. ALFRED STEVENS's paintings must always convince an amateur that there was no straining after some indefinite quality or expectation that by accident a lucky stroke would be accomplished. The modelling may not always be rigidly correct owing to carelessness or indifference, or his preference of colour to form. But in every part we feel the artist was at his ease and could realise all that he had in view. Indeed, he was capable of much more if he cared to exert himself.

It is to be hoped that some of his friends have BOSWELL's gift and will attempt to relate his conversations. He had a talent for narration, he mixed with many varieties of men and women, and he was as suggestive of life in his stories as in his paintings. He had known every painter and writer of any account who appeared in Paris during half a century, and his astonishing memory enabled him to recall traits in a manner which professional biographers might envy.

SERMONS IN STONE.*

FOR nearly a century the name of PETER BELL, the hawker of earthenware, has been a by-word, because

Nature ne'er could find the way
Into the heart of Peter Bell.
In vain, through every changeful year,
Did nature lead him as before;
A primrose by the river's brim
A yellow primrose was to him,
And it was nothing more.

It is hard for an honest trader to be pilloried for being unendowed with imagination, and for passing through picturesque districts without thinking of anything but his pots and pans. If he lived in our time he might be disposed, like other men, when looking on the primrose to think of the greatness of one political party and the misdeeds of another. In other words, the flower would now be to him a symbol, and expressive of many things which are not recognised in treatises on botany, or known to florists. PETER BELL in his second state would find other men who had acquired an esteem for the primrose as a political agent, and in that way he would belong to a cult, and would pride himself on his superiority over those to whom the primrose was still only a flower, a mere yellow sign of the return of spring.

We have sufficient evidence that from an early age symbols of a conventional, if not of a floral kind, were employed as marks of distinction, not merely in creeds, but among philosophers who were supposed to be superior to vanities, and indeed among men of all ranks. In a way they may indicate the difference between those belonging to the exoteric and esoteric class or degrees of rank. In course of time numerous associations were formed around the symbols, and their origin is therefore enveloped to an extent that obscures it.

It is not irreverential towards Christianity to say that its promotion was aided by symbols. Those which are to be seen in the catacombs may have been intended to suggest to the Roman police that the object of the meetings was innocent merrymaking. Amorini, grapes, flowers, a shepherd, birds, palm branches, stars, fish and the like seemed to be not more subtle in their signification than the simple representations of things that we sometimes see in distemper on the walls of shelters in English tea-gardens. The police authorities were no doubt aware that the figures had other meanings. But in no State where law has a scientific basis is there liberty to read meanings into the forms of objects. To the Christians, or at least to those among them who were fully initiated, the figures in the early places of assembly were eloquent enough. They were mute exhortations to faithfulness. We may suppose that addresses were given not only to explain them, but to prove that there was a special fitness in having such symbols already prepared. Indeed, there can be little doubt that the adoption of symbols was sometimes carried to excess. Gnostics, Easterns, Greeks and Egyptians introduced signs which originally were likely to have had less suitable meanings.

When Christianity was able to utilise basilicas as churches the desire for symbolism continued to be employed in order to make the buildings uphold the doctrine. The benches on which the pagan judges sat were appropriated by the clergy, and the power claimed of binding and loosening became more manifest than when services were held in subterranean or in humble chambers. The basilican type was therefore often adopted when churches had to be erected. But it could not be said that the Roman architects who created that type anticipated a time when the planning which was adopted for secular purposes should be utilised to

express theories of Christian doctrine. The word "basilica" signified, among other meanings, a palace, and the title was supposed to be adapted by Providence for houses of prayer and the dwelling-places of the King of kings.

This question of intention is one of extreme importance in connection with symbolism, as exemplified especially in church buildings. A modern architect, let us say, understands all the requirements of a church. He knows he has to respect certain precedents, and however much he might desire to introduce alterations he has not the necessary power. He is aware that tradition is in favour of adopting ornament and other details which are supposed to be efficacious in exciting desirable associations, or which are consistent with established principles. But the authors of the introductory essay to the translation of DURANDUS—MESSRS. NEALE and WEBB—who were potent in the early days of the Gothic Revival, would not be satisfied with such fitness in an architect as is derived from ordinary practice. Symbolism with them, and many other clergymen were found to adopt their view, signified *Sacramentality*; and as only men set apart could administer the sacraments of the Church, a peculiar body of architects should alone, it was declared, be allowed to design episcopal churches. In one place they write:—

We are not prepared to say that none but monks ought to design churches, or that it is impossible for a professional architect to build with the devotion and faith of an earlier time. But we do protest against the merely business-like spirit of the modern profession, and demand from them a more elevated and directly religious habit of mind. We surely ought to look, at least, for Church membership from one who ventures to design a church. There cannot be a more painful idea than that a separatist should be allowed to build a House of God, when he himself knows nothing of the ritual and worship of the Church from which he has strayed; to prepare both font and altar, when perchance he knows nothing of either sacrament but that he has always despised them. Or, again, to think that any churchman should allow himself to build a conventicle, and even sometimes to prostitute the speaking architecture of the Church to the service of her bitterest enemies. What idea can such a person have formed of the reality of church architecture? Conceive a churchman designing a triple window, admitted emblem of the Most Holy Trinity, for a congregation of Socinians. We wish to vindicate the dignity of this noble science against the treason of its own professors. If architecture is anything more than a mere trade; if it is, indeed, a liberal, intellectual art, a true branch of poesy, let us prize its reality and meaning and truthfulness, and, at least, not expose ourselves by giving to two contraries one and the same material expression.

It does not require a long argument to prove that such essentials could not fail to lead to hypocrisy. Skill in designing or construction became of less importance than external acts, which were calculated to impress the clergy with a belief that they were dealing with a modern BEZALEEL. We have been often puzzled in looking over the proceedings of the ecclesiological societies, of which MESSRS. NEALE and WEBB were among the inspirers, to see the number of plans by able architects which were "disapproved." Indeed, it would appear to be much easier to pass the ordeal of the works committee of a modern local board than that of the clerical judges fifty years ago. Apparently certain plans were supposed to be wanting in the desired but indefinite sacramentality, and for that mysterious quality no excellence of another kind could compensate.

It seems to us the great point to be considered in such cases is the effect which a church produces on the worshippers. If carved stones can become suggestive it surely is not necessary for attaining that effect to have acquaintance with all the religious acts of the carver or the state of his soul. That would be as unreasonable as to insist on the type, paper and ink used in printing a Bible or Book of Common Prayer being all produced by Christian hands. In all this we believe the editors

* *The Symbolism of Churches and Church Ornaments.* A translation of the first book of the "Rationale Divinorum Officiorum," written by William Durandus, sometime Bishop of Mende. With an introductory essay and notes by the Rev. John Mason Neale, B.A., and Rev. Benjamin Webb, B.A. (London: Gibbings & Co. Third edition.)

have not acted in the spirit of DURANDUS. The French bishop quotes St. AUGUSTINE as saying "so many things are varied by the different customs of divers places, that seldom or never can those causes be discovered which men followed in constituting them." In other words, let us accept forms which have been created, and if possible derive spiritual benefit from the stones without distracting our thoughts with speculations about the motives of the builders and artists. They, no doubt, like all honest men, considered the labourer was worthy of his price, for in the Middle Ages, as in our time, food and raiment had to be purchased, and their work could not be entirely spiritual or disinterested.

Unfortunately little is known about WILLIAM DURANDUS. He was born in Provence, where, he says, there was an altar of earth which MARY MAGDALEN and the three MARYS of the Gospels had set up. It might be supposed that with so simple an example DURANDUS would have been in favour of worshipping in the Temple of Immensity, but he was a true thirteenth-century bishop and loved churches and ecclesiastical ceremonies with all his heart. Evidently he was also gifted with a wonderful power of association, and could see analogies between all the parts of a church or the *instrumenta ecclesiastica* and the precepts of the Scriptures and the Fathers. Whether he was the representative of a class or was peculiar in his talent, he at least was a good example of the happily gifted men who are able to find "sermons in stones, books in the running brooks and good in everything." In our time he would have appreciated CARLYLE's words:—"It is in and through symbols that man, consciously or unconsciously, lives, works and has his being: those ages, moreover, are accounted the noblest which can the best recognise symbolical worth and prize it the highest. For is not a symbol ever, to him who has eyes for it, some dimmer or clearer revelation of the Godlike?"

In the thirteenth century few laymen were readers, and the "Rationale" was therefore intended for ecclesiastics, to enable them to understand more deeply the daily service. The ritual they followed was not always uniform, for different countries had more or less modified practices. DURANDUS, as an ecclesiastic, looked at things as he might have seen them from the pulpit. He evidently gave attention to detail. But he resembles the historians who wrote upon abbeys and churches. He tells us about the ceremonies that take place in laying the first stone and blessing the foundations, and how the church is to point due east. But he has not a word to say about the plans or directions which had to be prepared, or about the men from whom they were obtained. Certainly he does not prescribe any rules about pious architects, and, in fact, ignores the existence of all workmen. The larger stones, polished and squared, are to be placed on the outside at the corners, in order to represent men holier than others who retain weaker brethren in Holy Church. But rules about the dimensions are passed over, and the stones might have been miraculously dressed. The different sizes of the stones he compares with the different members bound together by a spirit of charity, as though united by cement. The cement of those days was ordinary mortar composed of lime, sand and water. The lime denoted fervent charity; the sand, efforts for the temporal welfare of the brethren, while the water was the Holy Spirit. The threefold division of a church he compared with the head, the hands and arms, and the trunk of the human body. The four walls symbolised the Evangelists; the roof, charity, which covereth a multitude of sins. The door signified obedience; the pavement humility. Some parts have more than one signification. The four walls also suggest the cardinal virtues. Transeptal churches signify that we are to be crucified to the world, while the circular churches suggest the universal extent of the Church itself. In that way DURANDUS considers the different parts of the building, nor does he forget its privileges, for he adds:—"In the last place, a consecrated church defendeth

murderers who take sanctuary in it from losing life or limb, provided that they have not offended in it or against it. Whence it is written that 'JOAB fled to the tabernacle, and laid hold on the horns of the altar.' The same privilege is possessed also by an unconsecrated church if the Divine offices be therein celebrated."

There is a chapter devoted to the altar. In the course of it he gives the remarkable statement that when CONSTANTINE built the Lateran Church he placed in it the Ark of the Testament which TITUS had brought from Jerusalem, and the golden candlestick with its seven branches. Speaking of pictures and ornaments, he is careful to point out the kind of respect which should be paid to them, and their excessive use was forbidden. He follows Pope GREGORY, who discriminated between pictures and descriptions; that is to say, between them and sermons:—"Paintings appear to move the mind more than descriptions; for deeds are placed before the eyes in paintings, and so appear to be actually carrying on. But in description, the deed is done as it were by hearsay: which affecteth the mind less when recalled to memory. Hence, also, is it that in churches we pay less reverence to books than to images and pictures."

In the thirteenth century hangings were used on certain occasions to conceal the mysteries; the sanctuary was divided from the clergy, and the clergy from the laity. But, in addition, curtains were used on festivals for the sake of ornament, in order that people might be induced to think of the beauty that was invisible. White curtains signified purity of living; red = charity; green = contemplation; black = mortification; livid colours = tribulation. The eggs of ostriches and other rarities were allowed to be exhibited in order to attract people to the church.

Bells also receive attention, and the chapter suggests the length to which symbolism was carried. The wooden frame signified the cross; the pegs by which the frame is joined, the oracles of the prophets; the iron clamps denote charity; the hammer is the right mind of the preacher; the rope is humility or the life of the preacher. Sometimes when composed of three strands it corresponds with the Scripture, which consists of history, allegory and morality. The pulley through which the rope passes is the crown of reward, final perseverance, or Holy Scripture.

There are other chapters by DURANDUS. We have also a supplement containing two chapters from the "Mystical Mirror of the Church" of HUGO DE SANCTO VICTOR. It is an older work than that of DURANDUS, and, of course, does not enter into the same detail. The differences between them serve to show that symbolism is not intrinsic in the form, but arises out of the peculiar vision of the expositor. Neither of them seemed to be able to discover any symbolic utility in architects or craftsmen.

When the translation appeared in 1842 it created a deep impression among the enthusiastic lovers of Gothic. But architects could not fail to realise that it was no more than the ingenious speculation of a good man. The book imparted a novel interest to churches. But as regards construction it did not serve to introduce any new feature. It was, however, essential in every architect's library as evidence of clerical thought in the thirteenth century. Now it may be taken as a companion to the Blue-book on ritual observances which lately was issued. For with such eloquent buildings as DURANDUS describes, ceremonies that would likewise be mystic and symbolic, while scriptural, would appear to be in keeping. We need not say that of late years the study of symbolism is not confined to architecture, iconography and ritual. It inspires several schools of poetry. The following extract by the editors, although written in 1842, serves to show that they also realised much more than was attempted in the "Rationale":—

Music, however, has the strongest claims to our notice. We know, for example, that each instrument symbolises

some particular colour. So, according to Haydn, the trombone is deep red; the trumpet, scarlet; the clarinet, orange; the oboe, yellow; the bassoon, deep yellow; the flute, sky blue; the diapason, deep blue; the double diapason, purple; the horn, violet; while the violin is pink; the viola, rose; the violoncello, red; and the double-bass, crimson. This by many would be called fanciful; therefore let us turn to a passage of Haydn's works and see if it will hold. Let us examine the sunrise in the "Creation." At the commencement, as it has been well observed, our attention is attracted by a soft-streaming sound from the violins, scarcely audible, till the pink rays of the second violin diverge into the chord of the second, to which is gradually imparted a greater fulness of colour, as the rose violas and red violoncellos steal in with expanding beauty, while the azure of the flute tempers the mounting rays of the violin. As the notes continue ascending to the highest point of brightness the orange of the clarinet, the scarlet of the trumpet, the purple of the double diapason unite in increasing splendour, till the sun appears at length in all the refulgence of harmony.

GRAVESEND, NORTHFLEET AND SWANSCOMBE.*

GRAVESEND has a history older than our oldest watering-place, Hastings, which dates, like Battle adjoining, from the Battle of Hastings. Gravesend can say, like Cobden to the noble lord who boasted that he came over with William the Norman, "Yes, but I was here before then." Gravesend, which has now nothing whatever antique about it but its bare name, is described in Domesday Book, as also Milton adjoining. At the time of taking the survey Gravesend manor formed part of the possessions of Odo, Bishop of Bayeux, half-brother to King William I., and is thus recorded:—"Herbert, son of Ivo, holds Gravesham of the Bishop of Baieux; it was taxed at two sulings and one yoke. The arable land is four carucates. In demesne there is one and four villeins with eight servants having two oxen. There is a church and one hythe. In the time of King Edward the Confessor it was worth ten pounds, when he received it as much, now eleven pounds. This manor was in three manors in the time of King Edward; Leoric and Ulwin and Godwin held them; now it is in one." On the disgrace of Odo, in 1083, it most probably reverted to the Crown, soon after which it became parcel of the demesnes of the Cramville family, called sometimes for shortness Cremille, who had likewise very considerable possessions in the eastern part of this county. They held this place at one knight's fee, parcel of the fourteen and a quarter which made up the barony of Peverel, being part of the lands assigned to John de Fienes and his assistants for the defence of Dover Castle, to which the tenant of Gravesend was bound to perform his ward three times in each year. Henry de Cramville possessed the manor of Gravesend, at his death in the fifty-fourth year of King Henry III. holding it of the king *in capite*, and was succeeded in it by his son Henry de Cramville, who died seized of it in the twenty-sixth year of Edward I., as did Joane, his wife, in the eighth year of King Edward II. After this it by some means came to the Crown, for Edward III. by his letters patent in his fourth year granted it in special tail to Robert de Ufford in consideration of his services, that he might the better support himself in the king's wars in Gascoigne. In the eleventh year of that reign, March 16, he was in the Parliament then held solemnly advanced to the title and dignity of Earl of Suffolk, after which he was continually employed by the king both in his wars and in the most important negotiations. In the eighteenth year of Edward III. he was made admiral of the king's fleet from the Thames mouth northward. He was present in the Battle of Poitiers. After that he was made a Knight of the Garter next in succession to those who were called the founders of it. He died in the forty-third year of the above reign, and was buried according to his will in the abbey of Campepe in Suffolk, having married Margaret, daughter of Sir Walter Norwich, of Suffolk, knight, by whom he had issue, Robert, his eldest son, who died in his lifetime without issue; William, who became his heir; and three daughters. William, who succeeded, was at the time thirty years of age, whose son afterwards conveyed it by sale to King

Edward III., who by his charter, dated October 5 in his fiftieth year, granted this manor among others to certain feoffees for the endowment of his newly-founded Cistercian abbey called St. Mary Grace, near the Tower of London. These feoffees after King Edward's death, in compliance with his last will, conveyed it to the abbot and monks there and their successors for forty years, to the intent that it might be given by King Richard II. in mortmain to them and their successors for ever. After this the abbot and convent granted their interest in this term at a certain yearly rent to Sir Simon de Burley, K.G., and Lord Warden of the Cinque Ports, who having forfeited it with his life for high treason in the tenth year of Richard II., that king by his letters patent, August 3, in his twelfth year, at the petition of the abbot and convent, granted to them and their successors the rents and profits of this manor among others, to hold to them as a sufficient endowment until he should otherwise alter or provide for them. After which this king, by letters patent, July 3, in his twenty-second year, granted it to them to hold in pure and perpetual alms for ever for the performance of certain religious purposes therein mentioned, and he also gave license to the surviving feoffees of King Edward III. to release and quit claim these manors and lands to them and their successors. The manor of Gravesend remained part of the possessions of the above monastery till the final dissolution in the thirtieth year of King Henry VIII., the next year after which it was together with the lands and revenues of it by the general words of the Act then passed given to the king, his heirs and successors for ever.

King Henry VIII., July 17, in his thirty-first year, granted among other premises to Sir Christopher Morrice (alias Morys), knight, all his manor of Gravesend with its rights, members and appurtenances in as ample a manner as it was lately let to John Laurente, and all these his lands and tenements in Pykeaxe land, and all those his lands called the "Ship," in Gravesend and Mylton, all which premises were parcel of the possessions of the late abbey of St. Mary Grace, London, to hold during the term of his natural life without any rent or account whatsoever.

He died possessed of these premises in the thirty-eighth year of that reign, soon after which, viz. on June 10 that year, the king granted to his widow, Elizabeth Morys, in consideration of the good services done to his person by his servant, Sir Christopher Morys, knight, lately deceased, this manor with all its rights, members, appurtenances, and sundry other premises in Gravesend and Mylton, late belonging to the above abbey, to hold during the term of her natural life at the yearly rent therein mentioned. King Edward VI., August 29, in his first year, granted to his uncle, Sir Thomas Seymour, knight, Lord Seymour of Sudley, &c., the office of bailiff of this manor for the term of his natural life, with the like fees, wages and emoluments that Sir Richard Long, knight, lately deceased, enjoyed with the same. On the attainder of Lord Seymour the king, January 8, in his third year, granted this office for life to Sir George Broke, K.G., Lord Cobham, and lieutenant of his town of Calais (?), with the like fees, wages and emoluments; which letters patent the Lord Brooke having surrendered in the seventh year of that reign, the king, April 10 of that year, granted other letters patent of the same to his servant, Sir Henry Sidney, knight, one of the four principal gentlemen of his privy chamber, with the like fees, wages and emoluments, to hold during the term of his natural life.

After the death of Lady Elizabeth Morys, King Edward VI., June 12, in his fifth year, demised this manor with the other premises late in her possession in ferme to his servant Thomas Asteley, Esq., for twenty-one years at the yearly rent therein mentioned.

It appears that this term was soon after resigned into the king's hands, for on June 28, in his seventh year, the king demised the manor and the above-mentioned premises to his servant John Fowler, one of the grooms of his privy chamber, and Anne, his wife, to hold during the term of their natural lives or the longest liver of them, without any rent or account whatsoever. They remained in possession of them in the eleventh year of Queen Elizabeth, soon after which Robert Dudley, Earl of Leicester, possessed the fee of this manor. He, in the twenty-third year of that reign, having obtained the queen's license for that purpose, conveyed it by sale to Thomas Gawdye and James Morice and their heirs.

In the twenty-fifth of that reign the sole right to this manor was become vested in Sir Thomas Gawdye, knight, who had then license to alienate it to William Brooke,

* Read at a meeting of the Upper Norwood Athenæum on July 21, by Mr. W. F. Potter, Architect.

Lord Cobham, and his heirs. William, Lord Cobham, was twice married, first to Dorothy, daughter of George, Lord Abergavenny, by whom he had an only daughter, Frances; and, secondly, to Frances, the daughter of Sir John Newton, knight, by whom he had three sons, Henry, William and George, and three daughters, Margaret, Frances and Elizabeth. He died April 5 anno 39 Queen Elizabeth, and was buried at Cobham, being at the time of his death Constable of Dover Castle, Warden of the Cinque Ports, Lord Chamberlain of the Queen's Household and K.G. He was succeeded by his eldest son Henry, Lord Cobham, who, being found guilty in the first year of King James I., together with his brother George and others, of conspiring to kill the king, and other acts of high treason, had judgment of death pronounced against them, upon which George, his brother, was beheaded, and both of them attainted, but the execution of the Lord Cobham and some of the others was, through the king's clemency, suspended. The manor of Gravesend coming thus to the Crown, it was afterwards granted by King James to his kinsman, Lodowick, son of the Duke of Lennox, in Scotland, whose descendant was created Duke of Richmond. But the manor of Gravesend, with Cobham Hall and the rest of the estates of Charles, Duke of Richmond, in this county were, about 1695, sold, at which time this manor came into the possession of Sir Joseph Williamson, and shortly after was possessed by the Earl of Darnley, from whom it has descended to the present Earl of Darnley, whose principal seat is Cobham Hall. Such are the extracts from Domesday and Hasted's "History of Kent," showing that Gravesend possesses a very respectable claim to antiquity. Then the question arises, How do we account for its present very "mushroom" appearance, there not being the slightest evidence of architectural antiquity from one end of the town to the other? The simple answer is that this unfortunate town has several times been destroyed by war and by fire. This town was burnt and plundered by the French and Spaniards in the reign of Richard II., to compensate which the king vested it and Milton with the sole privilege of carrying passengers by water to London, which was confirmed by Henry VIII. We have already learnt that there was a church and a hythe here in Saxon times as described in Domesday Book. The original church of Gravesend was dedicated to St. Mary, and stood in a field still called Churchfield, but being inconveniently situated for the purpose, the parishioners in 1497 obtained leave to build a chapel or oratory which afterwards became the parochial church; it was destroyed by fire in 1727, and the present church was erected in 1733, and in compliment to the king was dedicated to St. George.

Northfleet is thus described in Domesday Book:—"The Archbishop himself holds Norfluet in demesne for six sulings. It was taxed in the time of King Edward the Confessor, and now for five. The arable land is 14 carucates. In demesne there are two, and 36 villeins having ten carucates. There is a church and seven servants, and one mill of ten shillings, with one fishery, and 20 acres of meadow: wood for the pannage of 20 hogs. Its whole value in the time of Edward the Confessor, it was worth ten pounds, when he received 12 pounds, and now 27 pounds, and he pays 37 pounds and ten shillings. What Richard de Tonbridge holds in his lowy of this manor is worth 30 shillings."

The manor continued part of the possessions of the see of Canterbury till Archbishop Cranmer, in the twenty-ninth of Henry VIII., conveyed it with the rectory, parsonage and glebe, and the advowson of the vicarage to that king in exchange for other premises.

Queen Elizabeth granted it to James Guilford, after which it was assigned to Lord Watton; but it was again in the hands of the Crown at the death of Charles I. in 1649. This manor, with its appurtenances, was afterwards sold to John Brown, with whom it remained till the restoration of King Charles II. in 1660, when it again returned to the Crown, where it remained till the twenty-second year of that reign, when the quit rents of this manor, amounting to upwards of 50*l.* per annum, were purchased by the Dean and Chapter of Rochester, part of whose revenues they still continue. The manor itself, with the royalties appertaining to it, still remained in the Crown, where it continued till about the year 1758, when it was granted to William, Earl of Bessborough, at the yearly fee farm rent of 6*s.* 8*d.* He in 1760 conveyed it, together with Ingress in the parish of Swanscombe, to John Calcraft, Esq., who died possessed of it in 1772. Northfleet Church is dedicated to St. Botolph, and is a venerable and very spacious structure, and is

referred to in Domesday Book. It consists of nave, chancel, side aisles and a tower with six bells at the west end. The living is a vicarage valued in the king's books at 20*l.* (now 400*l.*), in the patronage of the Crown. In the south wall are three stone stalls, and on a slab in the pavement was a full-length figure in brass of a priest standing under a richly ornamented canopy with an imperfect Latin inscription round it. The grave beneath being opened some years ago, the body of Peter de Lucy was found encased in leather. This brass, with others, was taken up and deposited in a closet. Here is also a fine alabaster tomb to the memory of Dr. Edward Browne, physician to Charles II., and author of travels in Hungary. This church was part of the ancient possessions of the see of Canterbury, and was given, with its appurtenances, to the monks of St. Andrew, Rochester, by Archbishop Anselm in 1093.

His successor, Archbishop Ralph, confirmed this gift to them, and besides gave them an acre of his demesne land there, in a field called Gudlesfield, for the building of houses for themselves and their chaplain, and the tithes of all villeins that held land in Dune, all which were confirmed to the church of Rochester by several succeeding archbishops and by King Henry II. Notwithstanding these several confirmations of the gift of the church of Northfleet to the priory of Rochester, it seems they had to struggle hard to maintain their right to it and for that purpose appealed to the Court of Rome, whither in the year 1240 the prior and convent sent one of their brethren as their proctor to manage this business against Edmund, then Archbishop of Canterbury.

This church afterwards continued part of the possessions of the see of Canterbury till the twenty-ninth year of King Henry VIII., when Archbishop Cranmer conveyed to that king in exchange the manor and the rectory, parsonage and glebe of Northfleet, with the advowson of the vicarage of this church, since when the advowson has remained in the possession of the Crown. Northfleet Church is one of the largest in Kent; it is loftily situated in the village. In the year 1863 there was a complete and perfect restoration of the chancel, which is upwards of 50 feet in length and is believed to date from the early part of the fourteenth century, when Peter de Lucy was vicar, who died in 1370.

Dr. Thorpe and other antiquaries have supposed Swanscombe to have been the Vagniacæ of the Romans. The ancient Watling Street, or Claudian Way, commenced by the Emperor Claudius and completed in the reign of Vitellius, the ninth Roman emperor, and from whom it takes its name, Vitellina Strata, or Watling Street, passes through Swanscombe Park Wood. This wood is well-known: here was a cavern called "Clabberknapper's Hole" in its northern extremity, and is a fine British oppidum; on the south side is the track of the old Watling Street, and there is also in the wood the remains of an extensive British encampment. Some years ago there was a stone dug up at Southfleet, near here, which proved to be a Roman milliare or milestone; it lay on its side about a foot below the surface of the ground in Watling Street, and was about 2 feet 6 inches long, and on one side it was deeply cut with the letter X, the Roman numeral for ten, this spot being about ten Italian miles from the Medway at Rochester.

The chief historical event connected with Swanscombe was the landing of King Sweyn near the place; he landed at Greenhithe, formerly part of this parish, and marched from here and encamped at Swanscombe, or Sweyn's Camp, written in Domesday Book Swine's Camp. He was proclaimed first Danish king of England in 1013, but he died the following year, and was succeeded by his son Canute.

The next conqueror of England, William the Norman, after the Battle of Hastings, was met by the Kentish men at Swanscombe, headed by Archbishop Stigand, and Egelsine, Abbot of St. Augustine, each man having a bough of a tree in his hand, so that the whole multitude seemed a moving forest, when, throwing down their boughs at the sound of a trumpet, they appeared with their arms prepared for battle. This somewhat alarmed William, but on being told by the archbishop and abbot that the people of Kent were come to assure him of the submission of the county, and withal to demand the confirmation of their ancient laws and privileges, he thereupon received them very graciously, and not so willingly as wisely granted their requests, which include the ancient laws of gavelkind. This account is found in a manuscript history of St. Augustine's, Canterbury, drawn up by Thomas Sprot.

Swanscombe Church, dedicated to St. Peter and St. Paul, is described in Parker's "Glossary of Architecture" as the

last of the Saxon churches that is still used for worship. There are older ruins, such as the Reculvers, which contain Roman work, and the Saxon church ruins in the Roman Pharos at Dover, but this Swanscombe Church, which was originally constructed by our Saxon forefathers, and has been twice struck by lightning and met with many vicissitudes, is still used for Divine service. Parker, in his "Glossary," says that buildings where bricks are found "are evidently constructed with the wrecks of Roman work, as in the churches of Brixworth in Northamptonshire, Darenth in Kent and the ruined church in Dover Castle." The quantity of Saxon brickwork found in Swanscombe Church no doubt justified Dr. Thorpe in his supposition that this town was the Vaginacæ of the Romans, the site of which has not yet come to light. Swanscombe Church was struck by lightning on Whit Tuesday in 1802. It was reopened by the Bishop of Rochester June 23, 1903, after it was struck by a thunderbolt, August 14, 1902, or about a century after its first attack by lightning. The Saxon window of Roman bricks in the tower fortunately escaped. A very graphic account of the destruction and damage done to this church in 1902 appeared in the *Daily Telegraph* at that time, together with a short history of the structure; all this will be found reproduced in *The Architect* in August 1902. When last struck by lightning the shingled octagon spire which surmounted the square tower with its eighteenth-century bells disappeared, and the precious Norman font of solid chalk stone was shattered. This has been pieced and restored as we have seen. With difficulty the church registers, dating back to 1549, were rescued in a sadly battered condition. This church was restored in 1874 by Mr. J. Bignell, architect, and again restored by him. There is a portion of a pre-Reformation altar inserted in the present Communion table. Of the monuments in the church the principal are those to members of the Weldon family, including Sir Ralph Weldon, "Chiefe Clarke of the Kitchin to Elizabeth, and afterwards Clarke Comptroler to King James, and dyed Cla. of the Grencloth on the 12th of November, in the yeare 1609." Sir Ralph's grandfather served King Henry VII., and was Master of the Household to King Henry VIII. The epitaph is as follows:—

To the Memory of Edward Weldon.
Let this suffice for those who hereby passe
To signifye, howe, when and who he was,
And for his life, his charge and honest fame,
He hath Well-don, and so made good his name.

He was father to Anthony, the author of "Memoirs of the Court of James I." and grandfather of the above Sir Ralph Weldon.

THE STORY OF A NORMAN FONT.

MUCH excitement is stated to have been aroused in North Notts and Lincolnshire by the assertion that the font in the old parish church of Austerfield, North Lincolnshire, the home of the Pilgrim Fathers, at which the leader of the little band, William Bradford, was baptized, is nothing more than a farmer's stone cattle trough. Every summer dozens of Americans visit the parish of Austerfield, and one of the chief objects is naturally the parish church wherein the Pilgrim Fathers worshipped, while the font has always been pointed out as the one from which the water was taken for Bradford's baptism. With a view to obtaining the facts a Press representative, says the *Birmingham Daily Post*, has paid a visit to the district and gathered many interesting details. He learned that about fifty years ago the then sexton, a man named Milner, was ordered to remove a quantity of rubbish and to sell what he could. This he duly carried into effect, and among the "rubbish" removed was the historic Norman font, which he sold to a local farmer named John Jackson. After a time the font passed from Jackson to his son William, who was the tenant of the New Park farm, Austerfield, and he had it placed in his garden as an ornament. In 1895 the younger Jackson ceased to be the occupier of the farm mentioned, and the font, along with other fixtures, passed to the new tenant, Mr. W. E. Fielding. In the auctioneers' inventory award, dated April 15, 1895, it is described thus, "Garden.—Stone baptismal font, formerly in Austerfield parish church." Mr. Fielding presented the relic to his mother, who was born in Austerfield, and she in turn handed the font over to the trustees of the Primitive Methodist chapel at Lound, a small village near Retford, where it now remains. It is alleged that when the then incumbent of Austerfield became aware that the font had been removed he sent for Sexton Milner and explained the gravity

of the situation. Milner, in order to avoid further trouble, consented to present the church with a stone trough which he had at his farmstead. This he did, and it is the substituted trough, so it is stated, that has been pointed out to the American visitors as the identical font at which Bradford was baptized. During the past few weeks Austerfield churchmen have endeavoured to persuade the Lound Primitive Methodist chapel trustees to give up possession of the font, which they consider rightly belongs to Austerfield, but without success. The story narrated above is corroborated by the circuit trustees at Retford, Messrs. Charles Taylor and John Peatfield.

THE COVENTRY GRAMMAR SCHOOL.

AN appeal has been issued for funds to restore and enlarge the building in Bishop Street, Coventry, known as the old Grammar School, for as such it was used for about three centuries. A report on the state of the building has been made by Mr. W. Weir on behalf of the Society for the Protection of Ancient Buildings. He describes the school as of extreme interest, and built in the fourteenth century, in connection with a religious house, and is still called St. John's Hospital. About seventy years ago the building was reduced at the west end, when Bishop Street was widened. The old fourteenth-century window of five lights was evidently refixed, but otherwise the west front was modernised. There are two three-light fourteenth-century windows at the east end of the south wall in fair condition. Mr. Weir indicates the repairs which are necessary to the building, but says the condition of the roof appears to be thoroughly sound. It is proposed to add new classrooms to the north and east of the existing building. The classroom at the east end, it is proposed, should have a doorway leading into the assembly-room formed through the wall under the centre of the east window; but, says Mr. Weir, there is not sufficient height under the window to allow of a strong enough lintel being formed to support the window, and he feels sure that any such attempt will end in serious damage to the window sooner or later. The entrance could be arranged through the proposed classroom on the north side. The assembly-room is surrounded with fine old fourteenth-century miserere seats, which would require to be rearranged to allow of an entrance being formed from the new classrooms, unless it could be arranged to use the old doorway near the centre of the north side. There is supposed to be a crypt under a portion of the old building. In conclusion, Mr. Weir states that a scheme has been prepared for the treatment of the proposed new classrooms, which it would be well for the Society for the Protection of Ancient Buildings to see and advise upon.

DUST ON ROADS.

IN a letter to the *Times* General Brymer Schreiber writes:—"On the 20th inst. I had occasion to pass three or four hours in Woodbridge, Suffolk—the town is on the main road from London to Yarmouth—and I gathered from questions asked that about fifty to sixty motor-cars, besides the ordinary traffic of a quiet agricultural district, pass along the 'Thoroughfare,' about one mile in length, daily. I was struck by the extraordinary dryness of the streets and at the same time the utter absence of dust when motor-cars passed. I asked for information from various tradesmen and others living in the Thoroughfare as to how this happy state of affairs was brought about. They all told the same tale, viz. that this year their lives were bearable—they could open their doors and windows and enjoy the summer air in place of being, as quite recently, smothered with dust if they tried to take such liberties. To find the exact why and wherefore of this most remarkably pleasant change I had to go to the office of the clerk to the sanitary Council. I there learnt that owing to certain information given in some paper devoted to these subjects the Council had decided to give a trial to using a solution of chloride of calcium for watering the streets, which has so far been attended with complete success.

"I was in Woodbridge on the 20th inst., and the clerk to the Council assured me that the streets had not been thoroughly drenched with the solution since July 28. They had been watered lightly once daily early in the morning. They were in perfect condition, and not a particle of dust flying when I inspected them.

"Chloride of calcium can be purchased at 30s. per ton at the works at Northwich, and the strength of the solution is 1 cwt. to 100 gallons of water for first heavy watering—half-strength afterwards."

NOTES AND COMMENTS.

DISUNION in Ireland has been exhibited under so many forms during more than seven centuries, we presume it is unavoidable, and may arise from conditions of climate or race which have yet to be investigated. It will therefore cause no surprise either in or out of Ireland when it is known that the Ulster Society of Architects has ceased to be affiliated to the Royal Institute of Architects of Ireland. As no architectural society is supposed to be able to stand alone, application is to be made to the Royal Institute of British Architects to take the place of the Dublin Institute. As the principle, *Divide et impera*, has always been acted upon in the relations between England and Ireland, we expect the Ulster Society will be welcome in Conduit Street. The ostensible cause is some alteration in the by-laws relating to conditions of contract. But Irishmen can find quarrel in a straw if a more important incentive is wanting. Belfast, no doubt, is a thriving city which is envious of the dignity attained by Dublin as a capital. All the inhabitants believe in their importance, and we imagine there would be no division if the older Society agreed to become affiliated to the Ulster Society, although very much its junior. The Irish Institute has not been lucky of late, for the Master Builders' Association have repudiated its conditions of contract, which required about six years to prepare.

It is sometimes recommended that hospital buildings should always be of a temporary character in order that they may be totally destroyed by fire after a few years' use. That might be an efficacious mode of dealing with disease germs. From the report of the medical superintendent of the Bangour Asylum to the Edinburgh District Lunacy Board it appears that five villa buildings of wood and iron were used by officers and patients during nineteen months. The plans were well thought out and their arrangements convenient and easily workable. After a residence in one of them for a year and a half Dr. KEAY testifies that they are comfortable and healthy. But owing to the nature of their construction they are easily damaged, and he fears that their upkeep in plaster and paint will be excessive. Since the villas were occupied, each has had a verandah erected on the side facing south at a cost of 475*l.* for the five, and these verandahs have been found most useful. Besides the villas, buildings to accommodate 754 patients are now completed or are in course of erection.

COMPETITION DESIGN FOR THE PEACE PALACE AT THE HAGUE.

THIS design, which is an example of commodious arrangement, was submitted in the recent competition by Mr. J. HATCHARD SMITH, F.R.I.B.A. The principal entrance is in the centre of the façade under a lofty portico and through bronze gates into a vestibule, through which the great hall is approached with the grand staircase facing the entrance. The large court of justice and the small court of justice are entered direct from the great hall. The other rooms, the council-rooms, waiting-rooms, lavatories and wardrobes are all *en suite* with the judge's room, approached by large and well-lighted corridors. A special entrance is arranged from the park for the use of the judge, counsel, &c. This entrance could also be used as office entrance when the principal entrance was not required. The Chancery room, with safe and book-lift, adjoins the staircase communicating with the first floor. The buffet is placed conveniently at the end of the great hall.

The first floor is approached by the grand staircase leading to the ante-room of the permanent court of arbitration, with a room for the president, and lavatory, a room for the general secretary, with waiting-room and lavatory, two secretaries' rooms, two rooms for clerks, four study rooms and two spare rooms. These rooms are all *en suite*, and form with the ground floor a suite of magnificent reception-rooms. Large and well-lighted corridors communicate with the gallery at the side of the great hall and with the gallery of the large court of justice. Large rooms are arranged for archives, messengers, wardrobes, lavatories, &c.

The basement is approached by a staircase from the great hall and also from the vestibule, and contains a room for stenographers and spare rooms approached by well-lighted corridors.

The caretaker's rooms have direct access to the park and communication with the different floors by means of a service staircase. There are four rooms, with kitchen, &c. The place for the calorifers with fuel store is placed centrally underneath part of the great hall, and is entered from the caretaker's corridor. There are also wardrobes, lavatories, servants' rooms, waiting-rooms and store-rooms.

The library is arranged to form a separate part of the building. The principal entrance is at the side, from the park, and communicates by means of corridors with the great hall, and also by a staircase with the first floor. From the vestibule are entered the reading-rooms, map-room and librarian's room all *en suite*. The office for the distribution of books is placed immediately facing the entrance, and communicates directly with the library, which is well lighted from three sides, with shelves for 480,000 books in five floors. The ceiling of each floor is composed of glass. The spiral staircase and the lift for books communicate with the several storeys. The upper floor contains a room for the board of directors of the Carnegie Foundation, with a waiting-room, a Chancery room, spare rooms, messenger rooms, wardrobes, lavatories, &c. The basement contains the caretaker's apartments, consisting of four rooms and kitchen, having entrance direct from the park, and communicating with the other floors by means of a service staircase. There are also rooms for packing and unpacking, bookbinders' workshop and spare rooms.

It was intended to have the exterior faced with selected stone. The facing of the light areas would be of glazed brick; the great hall and vestibule to be faced with stone.

The columns in the great hall and the large and small courts of justice are of grey marble, with bronze capitals and bases of black marble. The dados of the corridors, the courts and the ante-chamber are of marble. The principal staircase is marble, but all the other staircases are to be Portland stone.

The floors of the great hall and vestibule are of marble and the corridors marble mosaic. The floors of all the other rooms are of oak parquet, except those in the basement. All the joinery to be of hard selected wood. All girders, stanchions and steelwork to be surrounded by concrete. All floors are fireproof. The doors to the principal entrances are of bronze. All the roofs are covered with cement concrete and asphalt. The ceilings of all the rooms, except in the basement, are of fibrous plaster.

The problem offered was difficult, as only sketches were sought. In this case the design could become well adapted for the contemplated use.

ST. DAVIDS CATHEDRAL.*

(Continued from page 135.)

THE choir itself is now the only portion of the building east of the tower retained as part of the church, and, with a small exception, the only part which retains its roof. The aisles of the choir, like the chapels beyond it, are nearly ruinous, being blocked off from the choir, and roofless; their large windows also are completely filled up with masonry. Nevertheless, their regular ranges of buttresses and pinnacles continued uniformly along the choir aisles and eastern chapels, notwithstanding many of the pinnacles have been broken off, still suggest the notion of no inconsiderable architectural display. The arrangement here has a great advantage over the similar one in the nave, on account of the much smaller width of the bays. Externally, therefore, we discern but little trace of the original choir, except in the tall clerestory, which though no great work of art externally, has a very fine effect, rising as it does among ruins. Here when the roof was lowered the walls were considerably raised and embattled without disturbing the four plain lancets of the clerestory, so that the large space above them has a singular appearance. The corbel table marking the original spring of the roof still remains, and the weather moulding may be traced against the east wall of the tower, with its apex rising somewhat higher than those of the nave and transepts, so that the excess of height in the choir, which is now very conspicuous, must have been designed in a smaller degree from the time when the present clerestory was built. It may probably have been occasioned by the rise of the ground towards the east. The design of the east end may be tolerably well made out, as it stood before the addition of the eastern chapels. The angles, both of the choir and its aisles, were flanked by square turrets, with angle shafts similar to those attached to the transepts, but of richer design. Over the triplet, which still remains, was an Early English composition, which from the small traces left appears to have consisted of a quintriple of windows, with a niche on each side forming a portion of the same design, and another niche on each side higher up. Through this has been cut a large Perpendicular window of seven lights, subarcuated with a common complement; this forms the present east window of the clerestory. Portions of the turrets may be discerned at all the angles embedded in the later walls, but in the south aisle a Decorated buttress with a rich pinnacle has been substituted externally; the northern turret remains, with a plainer pinnacle placed upon it.

The internal view of the choir is certainly one of the most attractive features of the church, and though, as we shall see, it has undergone more alterations than might at first sight be imagined, its general effect is decidedly harmonious. There is no lack of ornament, but the simplicity of composition forms a decided contrast to the effect produced by the over-complicated design of the nave, and is indeed a positive relief to the eye after contemplating the latter. There are four bays of extremely simple yet beautiful elevation; the piers, massive columns alternately round and octagonal with tall clustered shafts attached, support pointed arches with mouldings of much the same character, though not the identical section, with those in the nave. The transitional vaulting shafts terminate a little under the string above the arcade, and support much smaller Decorated ones with rich capitals; that is, where they have been carved, for some are left in the block. There is no triforium and the clerestory consists simply of the lancets visible without, widely splayed and with a light form of the chevron moulding on their jambs. Nothing can well be simpler than this composition, yet it is wonderfully effective; the only important fault is that the piers are decidedly too massive for the mouldings of the arches, so that neither of the ideas which they respectively suggest is well carried out. There is also a degree of awkwardness in the way in which the vaulting shafts are attached, producing a certain amount of interpenetration; in both these respects the arrangements of the nave are decidedly preferable. The east end is of two stages; the lower one consists of an exceedingly rich triplet, exhibiting Norman and Early English detail more palpably intermingled than any other portion of the church, there being a profusion of rich Romanesque mouldings, while the shafts, which are banded several times, have both the round and the square abacus. But we may remark that the round was evidently that

which the architect employed when there was no special reason for the square, as the former occurs in the two central shafts which stand free, the latter only in the responds, where it is the continuation of a string, being just the position where the square form was usually continued latest. The capitals, too, share the diversity, those under the square abacus being of the cushion form, while those under the round are decidedly Early English. This fine window is now blocked on account of the addition of the eastern chapels. Below this is a very rich string, or rather band, consisting of a large embattled moulding resting on a series of intersecting semicircular arches. The wall below this is rubble, above it ashlar, which, together with the spandrels of the arches, has been recently scraped, greatly to the improvement of the effect, as bringing out the fine hue of the stone and revealing some arrangements of stones of different colours. In the upper stage the Early English jambs still remain nearly perfect, and the mouldings of the original composition appear to have been worked up again into the rear arch of the large Perpendicular window which has usurped its place. There are here some good capitals, mostly pure Early English, though one, an inner one to the window, retains some Romanesque tinge. A passage runs along this window, approached by a staircase in the north-east angle of the choir, and is continued partially along the south side of the clerestory. Yet the string below it has been cut through apparently without any necessity; it terminates at one end in foliage, at the other in a monstrous figure.

The chapels east of the choir are remarkably extensive and complicated for a church of the moderate size of St. Davids, and no part of the building seems more constantly to have occupied the attention of the prelates who were successively benefactors to the cathedral. Their plan may be loosely described as consisting of a central portion continued from the main body of the church, with aisles continued from those of the choir, not extending to the east end. But it must not be supposed that these aisles are divided from the central portion by the same regular and continuous arcades which we have seen in the nave and choir, nor yet that the central portion itself forms one continuous architectural range. The whole is one vast mass of patchwork, the result of successive changes following fast upon one another, and exhibiting even less regard than usual to the conceptions and intentions of those who had preceded in the work.

Immediately to the east of the choir, but stretching a little further to the north so as to diminish somewhat from the breadth of the north aisle, is Bishop Vaughan's or the Trinity Chapel. This structure, together with the chapel immediately to the east of it, retains its roofs both internal and external, while the rest of the chapels remain completely uncovered. They may be considered as forming one division of the church, being of one height and width, and in their present form of one date. They are of the same height with the lower range of the east end of the choir, whose rich triplet they block while the upper window stands free above them. Bishop Vaughan's Chapel is an extremely fine specimen of Late Perpendicular, and that of the best kind, and is the more conspicuous as being the only portion of the cathedral of any merit or importance belonging to that style. It exhibits the same chasteness of design and delicacy of execution which distinguishes King's College Chapel, opposed alike to the meagreness of Bath Abbey and the corrupt forms and overdone ornament of Henry VII.'s Chapel. The arches, one on each side, which divide the chapel from the aisles, command admiration for the justness of their proportions and the purity of their detail, being well moulded, and having shafts with good capitals and bases; the stone screens also with which they are filled up increase the effect of elegant richness. It is much to be regretted that they should remain exposed to the effect of the weather, even comparatively sheltered as they are by the main body of the cathedral. The roof is of excellent fan tracery, consisting of two bays running north and south, with a small portion of panelled barrel vaulting at each end. The roof rises from shafts, of which the central ones at each end are corbelled off. The eastern one would have interfered with the altar of the chapel, the western with the doorway which then opened behind the high altar, and whose arch may still be traced. The whole interior of the chapel is lined with ashlar, except where the eastern triplet of the choir is blocked, some traces of which still peep through. The clerestory windows on each side are the least satisfactory part of the structure, on account of the straight lines employed, especially when

* From the *History and Antiquities of St. Davids*. Architectural Description of the Cathedral, by W. S. Jones, M.A., and E. A. Freeman, M.A.

viewed from the outside, where their peculiar form and proportions are not explained or excused by the line of vaulting with which they coincide internally.

The narrow space which continues Bishop Vaughan's Chapel to the east is separated from the aisles by a light and elegant couplet of Early English arches on each side. Though not dissimilar in general effect, they present several smaller diversities, and we shall see that they are most probably not exactly of the same date. The section of the piers, if we may apply that name to such delicate clusters, is not the same on each side. The latter has also in its capital a delicate form of the nail-head moulding, an ornament which occurs nowhere else in the church. Also the northern arch has, internally that is, towards the central space, a round segmental rear arch over the couplet, while the southern has an arch of construction going through the wall. Two low segmental arches divide this space from the lady chapel to east, which is not a straight continuation of it, but occupies only its southern portion, leaving a blank wall to the north. This part retains its roof, a rather plain vault of stone of Perpendicular date, contemporary with which is a poor clerestory window on each side, with a depressed arch and mere intersecting lines for tracery.

The greater part of the lady chapel is essentially Early Decorated or rather transition from Early English to that style, and the strings, shafts, &c., of the original fabric remain in many parts. But completely without and to a great extent within it has assumed the character of a Perpendicular building, so far as the dilapidations of later times have allowed it to retain any character at all. Large Perpendicular windows, those in the eastern bay wider than in the west, have been inserted in the walls, and these again have since been completely blocked. A Perpendicular vault has been added, which has since fallen to the ground, and the pier between the chapel and the space to the west of it has been grievously though, as it would seem, necessarily disfigured by a huge prop. The chapel is terminated at the east by a flat end between small semi-hexagonal turrets, ending, as well as the buttresses, in heavy pinnacles, and it has had an open parapet round it similar to that on the tower, but of this finish only very small traces remain.

The chapel aisles, as they may be called, on each side of the central space are a continuation of those of the choir, and stretch a little east of the entrance to the lady chapel. But, as it will be remembered that the latter does not occupy the whole width of the central space, a small part of the north aisle stands free with a void space between it and the lady chapel. This produces a most curious effect outside, the more so that the lean-to roof of the aisle has so far positively nothing to lean against. Here also the most noticeable features are the mutilated fragments by which we have to trace out the history of the fabric. They may generally be described as Early English with Decorated alterations; but while in the north aisle the changes of that date extended only to the ordinary patchwork of heightening walls, inserting windows and making preparations for vaulting, in the south the whole southern and eastern walls were completely rebuilt. The result is that, even in its ruinous state, we have the remains of a building of very great beauty and exhibiting the Decorated style to a greater advantage than it appears in any other part of the church. The roof is indeed gone, the windows blocked, the whole disfigured and confused by the great arched props which have been found necessary to support the tottering walls of the central space; still we have the well-moulded strings, the delicate octagonal and clustered vaulting shafts, and above all, their beautiful flowered capitals. On the north side we obtain through the blocking a slight glimpse of the tracery of the windows. The side windows have evidently intersecting lines, like the single original one in the nave aisles; but, from the superior elegance of design exhibited in this part of the church, one would rather expect them to be filled up with some pattern of arch and foil tracery than to be left in the meagreness of the mere intersecting form. The east window appears to have been of that elegant form which is intermediate between Reticulated and Flamboyant.

There now only remains to be described the extraordinary building attached to the east face of the north transept. The general effect of this has been already alluded to, and, considered as part of the arrangements of the cathedral, it is fully as unique as is its appearance in an external view. It is continued from the north face of the transept, which it slightly exceeds in point of elevation. The external work is Decorated; the east end is flanked by two flat buttresses of very singular character, which are terminated by rich pinnacles, now mutilated.

Equally singular is the buttress dividing its two bays on the north side; flat at the bottom, after its first stage its projection becomes angular, and so runs up the whole height of the wall, becoming much smaller in its upper portion; its pinnacle is quite destroyed. At the junction with the transept a staircase is attached in a singular and almost indescribable way to the upper portion of the broad pilaster at the north-east corner of the transept. The windows of this part of the church have been peculiarly unfortunate, every one having been either blocked or modernised. The latter has been the case with all in the lowest range—one to the east and two to the north, as well as with the east window of the second stage; but signs of their original form, not very different in size or shape from their degenerate substitutes, may be pretty well traced out, and in that in the second range the internal jamb remains identical with those of the windows in the south chapel aisle. The east end has a very strange appearance, having three windows over each other, and a niche, not unlike a window, above all; that in the third stage is a blocked spherical triangle. To the north all the windows in the two upper stages are blocked, namely, in the second, one of two lights in the eastern bay, and in the third a short window of one light cinquefoiled in each bay. The lower part of the wall is of ashlar, the occurrence of which is so rare in the exterior of this church; the upper is of rubble, excepting the buttresses.

Within, the lower stage, originally St. Thomas's Chapel, is now applied to the threefold, but not inconsistent, uses of a chapter-house, a library and a vestry. It is remarkable as being the only part of the church, except the porch, which possesses, or can have ever possessed, a Decorated vault, though nearly the whole of the aisles and chapels were clearly designed for vaulting at that very period. The vault rises from octagonal shafts with round flowered capitals; the bosses are richly carved; the two principal keystones contain one a head of Our Lord, the other a figure of the Saviour surrounded by angels with censers. There is also an exceedingly rich Early English double piscina. This chapel was originally approached from the north transept, through the most northern of the three arches occupying its eastern side, a space being left between its south wall and the north wall of the choir aisle. This is now filled up by a modern external staircase leading to the second stage, the original ascent from the interior of the church having its course thus far diverted, though the upper part still remains. The other staircase, adjoining the transept, is disused. This storey was the original chapter-house, and afterwards the grammar school, but it is remarkably plain, and contains nothing worth notice except a Decorated fireplace in the west wall, which has a small Early English bracket capital, one floriated, the other with the nail-head worked in on each side, probably to carry lights. This position of a chapter-house in an upper stage of a building would seem to be very rare if not unique, and even its shape—that of a mere oblong room—though common enough earlier and later, is singular, considering that its erection belongs to the very time when so many beautiful polygonal chapter-houses were built in different parts of the kingdom. The roof at present is a modern coved ceiling, which cuts into the triangular window in the third stage, so that now there is only one stage (besides the space between the inner and outer roofs) above the lower chapel. But this triangular window and the two lancets to the north originally lighted a distinct stage of the building, the upper window of all merely airing the roof. Both the old chapter-house and the room over it can in this case hardly fail to have had flat ceilings. The latter was used as the treasury.

The principal dimensions of the church are as follows:—

	Feet	Inches.
Length of nave	127	4
Breadth of ditto to centre of arcades	33	0
" aisles to ditto	18	3
Length of transepts	44	6
Breadth of ditto	27	3
Square of lantern, interior	27	0
" exterior	40 feet by	39 0
Length of choir	53	6
Breadth of ditto	30	3
" north choir aisle	15	0
" south choir aisle	16	0
Total external length	306	0
Height of nave within	45	8
" lantern within	67	3
" whole tower externally from level of porch door	116	0

Two kinds of stone were in use for the ashlar and en

riched work throughout the fabric. One is a fine sandstone of a rather slaty texture, quarried at Caerfai, of a purple or violet colour varying to deep red. Of this the whole of the ashlar, mouldings and fine work, prior to the Perpendicular period, consists with a very few exceptions. These exceptions are the eastern arches of the south, and probably of the north transept, a portion of the east wall of the presbytery, and the lower arcade of the lantern, which are built of oolite alternately with the purple sandstone, and the southern couplet of the entrance to the lady chapel, consisting wholly of oolite, with a few ashlar stones and ornaments of the same material in the lady chapel and in the north chapel aisle. Of the oolite, probably brought from Gloucestershire or Somersetshire, and varying considerably in texture, nearly the whole of the enriched Perpendicular work consists: the most remarkable exception is the upper east window of the choir, the tracery of which is wholly of Caerfai stone.

SOMERSET ARCHÆOLOGICAL SOCIETY.

THE fifty-eighth annual meeting of the Somerset Archæological and Natural History Society was held this year at Minehead.

Mr. G. Fownes Luttrell, the president, in his address said they had done him a great honour in electing him their president for the year. It was the second time they had conferred the honour upon him, and he only wished his knowledge of archæology and archæological subjects enabled him to be worthy of it. The feeling of reverence for antiquarian subjects created and fostered had been, he was glad to say, apparent in the neighbourhood of Minehead. There had been no wanton destruction but an eminent wish for preservation. There were several instances of that in the neighbourhood.

Mr. Henry Hobhouse said it was no less than seventeen years ago that they met at Minehead under the same presidency. He thought they must all agree that during those seventeen years steady progress had been made in that county, as he believed in other counties in England, towards interesting people in the past history of the county. Wherever they looked they saw it. If they visited the museum at Taunton, and remembered what condition it was in seventeen years ago, they would see a vast improvement. The collections, he believed, had been largely added to, and they had all been excellently arranged under the superintendence of Mr. Gray. In his (Mr. Hobhouse's) own part of the county a visit to the small museum at Glastonbury must interest everybody, for therein they saw the oldest relics in the country of an almost prehistoric civilisation. He remembered some years ago, when he was President of that Society, presenting a scheme for the preparation of a county history. Of course, that scheme had not been completely carried out, but there had been a large mass of material prepared which, he was sure, would be of great assistance to his friend, Mr. Bates, in his herculean task, one part of which he was glad to say had been completed.

In the afternoon, says the *Somerset County Gazette*, the members visited St. Michael's Church, Minehead, which was described by the Rev. Prebendary Hancock. The church is mostly of fourteenth-century work, the tower 87 feet high being later, dating from about 1500. The latter contains eight bells, and some curious sculptures high up on its walls, that on the east depicting St. Michael the Archangel weighing souls, Satan at one end of the scales fraudulently pressing down the beam, while the Virgin Mary at the other frustrates his efforts. The church contains nave, north aisle and chantry chapel. The principal objects of interest are the richly-carved oak rood-screen, the staircase and turret leading to the rood-loft, the Perpendicular windows, the Jacobean Communion table, the beautiful modern reredos, the "Jack Hammer" on the north end of the screen, once used for striking the hours on the clock; the stained-glass memorial windows, the organ, by Norman & Beard, with detached console; the tomb and effigy of an unknown priest, on north side of sanctuary: an ancient carved oak chest, with panels containing the arms of its donor, Richard Fitzjames, vicar in 1484; the glass case upon it containing a black-letter Bible, date 1639, and other books, formerly chained; a curious wooden arch leading into a chantry chapel, now the vestry, with an early piscina and credence shelf below; the hammered iron modern lectern, the ancient chandelier, the elaborately carved font, with its eight sculptured figures; the boldly-rising tower arch, 25 feet high; the clock, a gift by a late

churchwarden, and the brasses and memorial-stones in the tower and chancel. The churchyard contains the shaft and base of an old cross, a familiar sight in most Somerset churchyards, and occasionally by waysides.

Subsequently, a visit was paid to the Manor Offices, which boast considerable antiquity, some old houses near the church being also inspected.

In the evening a meeting was held in the town hall for the reading of papers and discussion. Lieut.-Colonel Bramble presided in the absence of the president.

The Rev. F. W. Weaver read a paper on "Cleeve Abbey." He dealt with the history of the abbey. He explained that there was a church at Cleeve before the abbey was founded, and this was the reason why the parish was called Old Cleeve. The abbey was founded between 1189 and 1191, and was a daughter of Revesby Abbey, in the county of Lincoln. There was formerly a chapel on the cliff by the sea, but this, and also one subsequently built, had fallen away with the cliff.

The Rev. W. H. P. Greswell spoke of the great erosion of the cliffs of West Somerset which had taken place, and remarked that the chapel of St. Mary, which stood on the cliff in ancient times, had utterly disappeared into the sea. Even in the last seventy or eighty years three lime-kilns on the cliffs had been washed away one after the other.

The Chairman stated that it was a small Cistercian order of monks who taught the people of England agriculture, and if it had not been for them we should have been very far behind in that respect. It was rather peculiar that all the Cistercian abbeys were dedicated to St. Mary.

The Rev. W. H. P. Greswell read a paper on "The Norman Conquest of Somerset." He pointed out that the conquest in Somerset began in the neighbourhood of Selwood, in the east of the county on the line of the great foss-way from Bath to Ilchester, and from Ilchester to Exeter. The great centres from which the conquest was effected were Castle Cary, Stoke Courcy Castle, with a smaller fortress at Nether Stowey, Montacute, with the fortress of Neroche, and last of all Dunster Castle. This constituted, to his mind, a sort of second quadrilateral, by means of which William the Conqueror exercised his hold over the country. He did not think that Taunton Castle was ever used as a Norman fortress at the time of the Norman Conquest, although of course it was founded many years prior by Ina, king of Wessex. Bridgwater Castle was of later date altogether. He thought that Stoke Courcy Castle had been very much underrated in this matter. It was certainly one of the great strongholds of the district in the time of Henry III., and earlier than that it was in charge of William de Falaise, who must have commended himself to the Conqueror. Montacute Castle was the centre of the earlier Norman settlement.

Mr. F. Bligh Bond gave a lecture on "Screenwork in the Churches of West Somerset," illustrated with lantern views.

On the second day the party left Minehead at 9.30 and drove to Porlock Weir—a route which enabled the excursionists to enjoy a grand view of sylvan and mountain scenery—where they alighted and, permission having been obtained, proceeded on foot through the beautiful grounds of Ashley Combe, the residence of the Earl of Lovelace, to Culbone, where the miniature church nestling amid lovely woodland surroundings was visited. So small is the edifice that the party had to enter it in knots, and a description of it was therefore given outside by Mr. Bligh Bond, of Bristol, in the absence of Mr. Chadwyck-Healey, K.C. Mr. Bond explained that the church took its name from the dedicatory Saint Culbone or Culbon. The ancient name of the place was Kitnor, derived from the Anglo-Saxon cyta, a cavern, and ore, the sea shore. The church claimed to be the smallest in England, it being 33 feet in length and 12 feet in width. The honour of being the smallest was, however, disputed. Although the church was so small it was very complete, having its nave, chancel and south porch, with chancel screen and pews, quite in the old style. The churchyard consisted of a quarter of an acre, and in it were the remains of a fourteenth-century cross, with foot at the base surmounted with an octagonal calvary. A double-light window on the north side of the chancel was thought to be Saxon, and the work looked like it. There was a very ancient font, also thought to be Saxon, but it might be Norman. The screen had something of the Devonshire type in its carving, being one of the earliest forms of screens, and originally there was a rood-loft which projected out westward. There was a little window in the north wall, which seemed to have been put

in to give light to the loft. Mr. Bond called the attention of the party to some linen panels existing on the screen and on one of the benches.

Porlock Church (of which the Rev. W. H. B. Bunting is the rector) was subsequently visited. Mr. Chadwyck-Healey, K.C., chancellor of the diocese of Bath and Wells, pointed out that the earliest building stood on the site of the present church, and was supposed to be not earlier than the twelfth century, but there was little or nothing of it left. It was suggested that the earlier church was burnt. It was restored in the Early English period, and the remains they had of it were the window in the tower, three lights at the east end and the piscina, the latter being covered by a marble memorial tablet until the restoration in 1888 and 1890, when it was discovered. During the Early English period the aisle on the south side had a lean-to roof. The aisle was added during the time the Harringtons were lords of the manor, probably about the middle of the fifteenth century, in which period the ornaments on the roof were also added. He referred to the screens which had existed in the church, pointing out that there was one which divided the parish church from the Harrington chantry founded in 1475. That chantry was contemplated by John, Lord Harrington, who went to France with the second expedition after the battle of Agincourt. The chantry was not actually founded in the church until the year mentioned, and it was not absolutely clear why the foundation was so long delayed, but it was suggested that it was delayed till after the death of Lord Harrington's widow, who died in 1471. The chantry remained until chantries were abolished in the first year of Edward VI. Lord Harrington and his wife were represented in the monument now in the church. Probably the effigies originally stood on the floor of the south aisle. They were evidently of an earlier date than the canopy over them, and they were in existence before the chantry was actually founded. Another reason why it was suggested they were earlier was that the figure of Lady Harrington, who was a daughter of the Earl of Devon, represented her as quite a young woman, as she was when her husband died. It was not known where the figures were carved, but it was suggested that they were worked by the hands of some one who carved somewhat similar effigies in Staffordshire. There was a strong resemblance, from the artistic point of view, to the effigy of Sir Hugh Luttrell in the church at Dunster, he having died in 1420. During the last restoration of the church some Purbeck marble fragments, with fifteenth-century mouldings upon them were found, and when measured they almost exactly fitted one or other of the figures. At the east end of the chancel was the base of an "Easter tomb," as it was described, and comparing it with one in Dunster Church he had every confidence that both were by the same hand. The recumbent figure in armour near the south door had given rise to much discussion. It was commonly called the Crusader, because the legs were crossed, but that was an entire misapprehension, as Crusaders could be found without that arrangement, so that the attitude of the legs being crossed was not typical of the time of the Crusaders. Who the figure represented it was difficult to say. It was commonly thought—and he (Mr. Chadwyck-Healey) believed there was foundation for it—to represent Sir Simon Roges, the last lord of the manor of Porlock of that family. Behind the chancel was a priest's vestry or small chapel, and there was a great deal of speculation as to what that little excrescence was to the church. There were many suggestions, but none knew what it was, and it was one of the many puzzles which the church afforded.

Lieutenant-Colonel Bramble put the figure near the south door down to 1280, judging from the armour. The crossed legs had nothing to do with the Crusaders. Some people thought the figure was represented as drawing the sword, but it was representing sheathing it, and his opinion was that the crossed legs was simply an attitude of rest and repose.

Mr. Chadwyck-Healey referred to the altar-tomb in the porch of the church, pointing out that originally it was on the west side of the church out of doors, but it had got neglected, and having perished very much by the weather it had been brought into the porch for preservation. There were various suggestions as to what it was. One suggestion, which he preferred to others, was that it was originally the high altar of the church, and was turned out, as so many stone altars were, at the Reformation. Another suggestion was that it was a dole table used in the church.

The party then visited Doverly Court, an ancient

dwelling-house of the fifteenth century in Porlock, which Mr. Chadwyck-Healey has had restored and devoted to parochial uses, though many of the antiquities of the place have been preserved.

Leaving Porlock the party drove to Selworthy by way of Bossington, passing *en route* the ancient West Lynch Church, and on arriving at Selworthy Church (the Rev. A. E. Buchanan being the rector) the building was described by the Rev. Prebendary F. Hancock, formerly rector of Selworthy and now of Dunster. The rev. gentleman, who has published a history of Selworthy, called attention to the number of chapels of which that church formed the centre. One of the chapels was used as a barn until twenty years ago, when it was restored as a chapel of ease, and another chapel at Tiddington was used as a shed and outhouse until about fifty years ago, when it was restored or repaired and made into a dame school. About a mile to the north-east of Selworthy Church was the shell of another chapel, and to the south-west the ruins of another chapel on the way to Cloutsham, and the question had occurred as to what was the use of those chapels, but they were no doubt used as votive chapels. The greater part of Selworthy Church was Perpendicular. A fifteenth-century door still remained at the flight of steps leading to the church. He drew attention to the font, with its curious movable covering carved in the seventeenth century, and expressed the opinion that the base was probably Norman, about 1180. He pointed out the delicate carvings in the roof of the church, and explained that having become very dilapidated they had been lately restored, the work being done by the Selworthy Carving Guild, which was carried on with the assistance of the County Council, but the carving class, he explained, was in existence before Mr. Arthur Acland brought in his Technical Education Bill. The chancel was approached by two steps, and the piscina in the chancel indicated that it had been raised one step for the making of vaults existing underneath. During the restoration of the church in 1878 a painting of the Virgin and Holy Child was discovered underneath the east window of the south aisle. The sacristy was said to be the oldest part of the church. At one time a screen ran across the church, and a portion of it still remained, and it was very beautifully carved coloured and gilded. The date of the north aisle had been put by Mr. Sedding at 1390 or thereabouts. He called attention to the carved gallery across the western end of the church, and the chamber over the south entrance converted into a canopied pew for her family by Mrs. Fortescue, the great-grandmother of the present Sir Thomas Acland. The tower of the church, only 40 feet in height, was very massive. The tower was evidently part of an earlier English church, being allowed to remain when the building of which it formed a part was taken away to give place for a larger one. The tower contained a clock chamber and a room above. Preb. Hancock directed attention to fifteenth-century glass in the transoms, to the curious bosses in the nave, all the figures being different and worthy of study, and also to coats of arms of the family of St. John. Perhaps the chancel of the church was rebuilt by one of the St. Johns. The party also had their notice drawn to an interesting monument by Chantry to the Acland family.

The Rev. E. H. Bates thanked Preb. Hancock for giving them such an interesting account of the church in which he ministered so long.

The party then proceeded through Selworthy Green, where are almshouses erected by the late Sir Thomas Acland, to the old tithe barn, where tea was partaken of.

On the way back to Minehead Bratton Court was visited, a very ancient house which has recently been restored by the owner, the Earl of Lovelace, though many ancient bits of the old house have been retained. The property is occupied by Mr. T. Lovelace, and the party were shown over the premises under the guidance of Mr. T. H. Andrew, agent for the property. There is a fine old gateway at the approach to the property, with an ancient lodge above, and this part has in no way been disturbed. The Rev. E. H. Bates made some observations regarding the house, and pointed out that it was one of the few remaining specimens of an old English manor-house. He drew attention to the buildings being built in square formation, so as to preserve the utmost security to the occupier in olden days, and pointed out the portion of the premises believed to be used as a chapel in former times. Inside the house was the original hall of the manor of Bratton, but though it had now been screened the hall once ran the whole length of the house.

There was a tradition, he added, that the room over the gateway was the study of Henry de Bracton, one time Lord Chief Justice of England.

Considerable interest was evinced in the many remaining remnants of the old manor, after which the party returned to Minehead, which was reached shortly before seven o'clock.

In the evening a *conversazione* arranged by the local committee was held in the town hall, when the members of the Society and many others were entertained. The local committee had taken immense pains to make the gathering a success, and their admirable efforts were highly appreciated.

On the third day the party first visited the hilly village of Old Cleeve, and at once proceeded to the church, where they were welcomed by the vicar (the Rev. G. Weigall), who also gave a very lucid and comprehensive sketch of the architectural character of his church. He pointed out that although the parish church was in danger of being overshadowed by its more fascinating neighbour, Cleeve Abbey, yet the history of the church was older than that of the abbey, for monasteries came and went, whilst the parish church remained. The church, in its main features, was undoubtedly fifteenth century, but there was certainly a church in existence in 1198, in the time of William de Romara. Probably a Saxon or Roman church occupied the same site, but to-day all trace had disappeared. The old cross in the churchyard was doubtless a preaching station, and may have been the spot on which the Gospel was first proclaimed in the village of Old Cleeve. The three rough stones in the south side of the church, and which were now used as gargoyles, were possibly relics of a much earlier church. There was an old chest discovered beneath the tower, and this certainly went back to the fifteenth century, or probably earlier. The hole in the lid seemed to prove that the Church was not unmindful of collections in that early day. The font was fifteenth-century work, and rather larger than the fonts usually were of that period. The embattled western tower was most graceful and imposing, whilst the roof of the nave was of the typical Somerset waggon character. The bosses were large and delicately carved. The corbels supporting the beams were carved in the form of angels holding shields. The chancel retained a hagioscope or squint. There was an interesting tomb, of the date of 1640, on the north side of the nave, but its identity was sphinx-like in its inscrutability. The pulpit was modern, as also the lych gate at the entrance of the churchyard. The flattened appearance of the capitals at the entrance to the chancel seemed to suggest that at one time there was a rood-screen, but to-day no trace of it could be pointed out with certainty. The church contained several memorial windows, the most interesting being the one at the western end, erected to the memory of William Leonard Halliday, his wife and daughter, and to Edward Vibart, his wife and four children, all of whom perished in the Cawnpore massacre in 1857. On the north wall of the church were traces of the well-known Devil's door. The chalice was dated 1683 and was worthy of inspection. Other interesting objects in the church, which is dedicated to St. Andrew, included a mechanical musical instrument for the playing of the organ in the absence of the organist. This clever contrivance seemed to be the forerunner of the modern pianola. Some interesting fossilised remains found in the parish were also kept in the church.

Lieut.-Colonel J. R. Bramble offered some interesting remarks on the tomb in the north side of the church, and said the figure was attired in the ordinary civilian dress of the fifteenth century. Such examples were hardly rare, but they were certainly scarce. The east window, with its reticulated tracery, was certainly uncommon in this part of the country.

A short drive through the considerable hamlet of Washford brought the party to Cleeve Abbey, one of the most perfect Cistercian abbeys in the country. The abbey is owned by Mr. G. F. Luttrell, of Dunster Castle, who devotes the admission money to the benefit of Dunster cottage hospital. Lieut.-Colonel J. R. Bramble, F.S.A., whose experience of the abbey extends over many years, explained the fascinating buildings in his usual charming and interesting manner. With him as guide the company in imagination were able to rebuild the tottering walls and see the abbey once more in all its ancient glory. Dealing first with the unusual but elegant gatehouse that stands to the north-west of the monastery, the learned Colonel showed how this formed the guesthouse long before the time of good country

inns. It was an exceptionally large gatehouse, having regard to the size of the abbey, which was a small one. The gatehouse, which bore evidence of much work by Wm. Dovell, the last abbot, carried the exceedingly ambiguous Latin inscription, "Porta patens esto, nulli claudaris honesto." Above a square-headed window in a large canopied niche was pointed out a finely carved crucifix, well preserved and resting on an angel corbel. Passing into the abbey proper Colonel Bramble, standing in the western alley of the cloister, traced the history of the monastic buildings to the delight of his auditors. He pointed out that Cistercian abbeys were very similar in construction, and though differing somewhat in the internal arrangement by reason of varying size, yet in external plan were always similar. Churches in Cistercian abbeys were always dedicated to St. Mary, and, in consequence, they never found lady chapels in addition to the church. As a rule the buildings were very plain, and in the early examples it was unusual to find any carving. The church, the foundations of which now only remain, was minutely described, and was shown formerly to consist of the conventual church, with short eastern limb, nave with aisles, and one or two chapels. On the east side of the cloister attention was directed to the particularly beautiful Early English dormitory in the upper stage of the building. Beneath the dormitory were arranged such buildings as the sacristy, vaulted chapter-house with its triple entrance, the day stairs, the monks' day-room or calefactory—the room with a fire. Near by was discovered the heraldic tiled floor of an earlier building, and Colonel Bramble related how, many years ago, he devoted three days to securing a correct copy of each tile. These tiles bore the heraldic design of many well-known families who had acted as benefactors to the abbey. On the south side many interesting apartments were explained, and above them much attention was devoted to the refectory, a room of much architectural beauty. The western side of the cloister included a buttress structure of two storeys, partly devoted to the use of the lay brothers. Colonel Bramble subsequently conducted the archaeologists through the many buildings which, in the dull light of the rainy day, looked all the more impressive and imposing. Lingering long and frequently at each little mound and tattered wall he pieced together the story of the abbey, and brought vividly to the mind the picture of the earnest monks living their quiet day in their peaceful Somerset home. The thoughts of the cunning builders were revealed at every turn, and it was with reluctance that the enthusiastic antiquarians quitted the entrancing pile, which time so surely is obliterating.

A visit was next made to the church of Withycombe. Mr. Bligh Bond briefly summarised its architectural virtues. He pointed out that the church was dedicated to St. Nicholas, and went on to say that he believed that the church was of very early foundation. The south doorway was Early English in character, one or two of the windows of the church were of the Decorated period, whilst there was also a good deal of Perpendicular work in the church. The present tower probably belonged to an earlier church and stood in a peculiar position against the south wall. There were two nameless tombs in the building. The church possessed a very fine screen, with particularly delicate and graceful vine enrichment. The register dated from 1669, whilst the chalice was of pre-Reformation times.

The Rev. E. H. Bates offered some interesting conjectures as to the identity of the tombs and dwelt upon some of the legends with which the parish is saturated.

Lieut.-Colonel Bramble gave it as his opinion that the tombs told clearly the tale of heart interments, which were not altogether uncommon.

Owing to lack of time Carhampton Church had to be omitted from the programme, but the party were able to catch a fleeting glance of the ancient stone building, which is in the Perpendicular style. The little village, which is crowded with interesting features, gave the now extinct title of earl and viscount to the Luttrell family.

In pouring rain the party were next driven to the delightful old-world village of Dunster. Alighting at the venerable church the excursionists were welcomed by the vicar (the Rev. Prebendary Hancock, M.A., F.S.A.), whose love of his charge has found expression in a bold chronicle of its vigorous history. The Rev. Prebendary Hancock, in the course of a clear exposition, dilated upon the history and chief points of architectural interest of the church, the chequered tale of which is demonstrated by its curious internal arrangement. He said doubtless there was a church in early English times, but they knew nothing of its

history, but between the years 1080 and 1100 Wm. de Mohun granted the advowson of the church to the monks of the abbey of Bath, the result being that a church was built. Having commented upon the more striking Norman remains in the church, the vicar went on to say the piers showed signs of fire, probably being an attempt in the restless days of Stephen to reduce the building by fire. The roof generally was of the usual Somerset waggon character, but over the south aisle it was flat and richly treated. One of the things that the Dunster folk were most proud of was the rood-screen of 14 arches. The screen, which was beautifully carved, was carried right across the nave and aisles, and this fact told of the story how the church became to be divided. Up to the fifteenth century the monks and parishioners used the same church, but owing to the unpopularity of the Benedictine order a dispute arose between the monks and people. Hugh Luttrell took the side of his tenants, and as the result of arbitration the eastern part of the church was granted to the monks, whilst the parishioners were allowed to retain the nave. The handsome screen was erected partly to mark the division, but also to form a chancel for the parish church. The tower was in the middle of the building and was of stately proportions. The original tower either fell into disrepair or the parishioners desired a more imposing one, and the result was that in the middle of the fifteenth century money was raised to provide a new tower. The work of erecting the new tower was entrusted to a John Mallice, of Stogursey. Having dwelt upon the many interesting features in the parish church, the rev. gentleman turned to the Priory church, of which the owner of Dunster Castle is the lay rector. He emphasised the most important parts of the Priory church, dealing in an interesting manner with the chantries, &c. In the monastic church were several stately monuments to the Luttrell family, including one of alabaster, with recumbent effigies to Sir Hugh Luttrell and Catherine (Beaumont), his wife, 1431. There were several memorial windows in the parish church. The vicar called attention to three very ancient chests in the church, one being probably of the thirteenth century. The party later examined the many objects of interest in the two churches, whilst a few, regardless of the rain, inspected the Priory ruins in the vicarage grounds.

The Rev. E. H. Bates briefly expressed the thanks of the Society to the Rev. Preb. Hancock for his able description of the interesting church.

On leaving the building the archaeologists at once made their way to Dunster Castle, the famous seat of Mr. George Fownes Luttrell. The castle is a fortress of great antiquity, and was formerly a military post of importance. The castle is built on a hill or tor, and forms the north-east extremity of a lofty ridge. The history of the castle dates from the time of the Domesday Survey, when it was held by William de Mohun, and it is said to have been the stronghold of Aluric in the reign of the Confessor. Through the fiery reign of Stephen the castle played no inconspicuous part, but the present structure is chiefly the work of Sir Hugh Luttrell and his successors. By reason of the irregularity of the plan and varying character of outline the castle forms a building of considerable picturesqueness. The entrance to the castle is gained through a bold tower dating from Tudor times. The party was warmly welcomed by Mr. G. F. Luttrell, Mrs. Luttrell and Miss Luttrell, and in small bands conducted over the magnificent interior, which is exceedingly rich in art treasures and historical records. The many spacious apartments were slowly traversed by the archaeologists, to whom was explained the many objects of interest with which this stately home is stored. The many paintings, family and otherwise, were inspected with critical enthusiasm, a curious picture, called *The Device*, demanding much attention. The grand staircase, the work of Italian carvers, was much admired, the massive carving representing hunting scenes, whilst a coin cunningly inserted in the woodwork gives the date of the work as that of Charles II. The ceiling in the dining-room is the work of the same Italian masters. The armour-room was especially interesting, containing as it does guns used in the Civil War, in which bitter conflict the castle figured prominently. Prince Charles's bedroom was shown, and also the narrow passage, ending in an alcove behind the great bedstead, in which the prince is said to have hidden from his pursuers. Amongst the many other interesting features in the house not the least to attract attention were the leather wall drapings, on which are painted pictures in the career of Marc Antony and Cleopatra.

THE ORDNANCE SURVEY.

A CORRESPONDENT of the *Daily Graphic* has described the object of two cannon half buried in the earth on either side of Hounslow Heath, of which photographs appeared in that journal. The cannon, he says, mark the extremities of the very first base line taken for the trigonometrical survey of Great Britain and Ireland, on which the Ordnance maps were originally based. Most people are aware that the Ordnance Survey Department, the headquarters of which is at Southampton, was constituted to survey the United Kingdom in order that accurate maps of the whole of the country might be prepared; but few have any conception of the magnitude of the task then undertaken, or of the means by which the work was ultimately accomplished. Although the whole of the country has long since been surveyed and the maps published, the physical features portrayed on the maps are continually being transformed, and the operations of the Ordnance authorities are now solely directed to revising the earlier editions of the maps in order that they may be kept up to date so far as possible.

The first step in the survey of a large area of country is to spread a web of triangles over its surface in order that the relative positions of numerous points may be ascertained to enable detailed measurements of the surface features to be taken. The form of a triangle, it need hardly be said, is chosen simply because it lends itself to very precise mathematical calculation. The operation of triangulating may be thus summed up. When the distance between two points on the surface of the country to be surveyed has been measured for a base, and the angles which this line forms with some third point, taken as the vertex of the triangle, have been observed, the length of the other two sides can be calculated. These two sides then serve as bases for other triangles, the length of whose remaining sides are in the same way ascertained. By thus extending a series of triangles over a country its dimensions are obtained with the greatest accuracy.

The first base line in connection with the survey of this country was measured by General Roy across Hounslow Heath, Middlesex, during the month of August 1784. The General used three kinds of rods, namely, (1) 100 feet surveying chains, (2) glass tubes 20 feet long, and (3) deal rods 20 feet long, the line being measured three times, once with each kind of rod. The length of the line by the glass rods was 27,404.0137 feet, and by the chain 27,404.24 feet. The results obtained with the deal rods were disregarded, as the rods were found to be seriously affected by the humidity of the atmosphere. With them the line was made to be about 2 feet longer than with the other two. Consequently the mean of the results obtained with the iron and glass rods was taken as the true length of the line.

When this base was again measured in 1791 by General Mudge with an iron chain its extremities were marked by sinking old cannon in the ground, the centres of the muzzles being the terminal points. These cannon are the ones which appear in the photographs.

The triangulation of this country was carried out in three stages, namely, a primary, a secondary and a tertiary series of observations. The sides of the triangles in the primary series averaged 35 miles in length, there being only 250 primary stations all told. Some of the triangles had sides over 100 miles long. For instance, a line from Slieve Donard, in county Down, Ireland, to Sea Fell, in Cumberland, 111 miles, was one of the sides of a primary triangle. By the aid of the common mirror or heliostat, when the atmosphere was favourable it was found possible to take observations with a theodolite at these great distances, but, of course, owing to the rotundity of the earth, mountain and hill tops only were mutually visible. The secondary triangulation was attached to the primary stations and the sizes of the triangles were reduced by it to an average of 5-mile sides. The tertiary triangulation which followed multiplied the triangles so that their sides averaged in length only 1 mile. The sides of the tertiary triangles were then actually traced on the ground, and surveyors afterwards came upon the scene with measuring chains and took the necessary measurements to enable a plan of the part within each territory triangle to be prepared. Subsequently the Hounslow base was abandoned for one on Salisbury Plain, which was longer and more accurately measured. Another base line, 8 miles long, was also measured upon the shore of Lough Foyle, in the north of Ireland, and it is upon the Salisbury and the Lough Foyle bases that the triangulation of these islands has been made to rest.

Although begun so long ago as 1784, it was not until 1851 that the primary triangulation of the United Kingdom was finished, and a little more than twenty years ago since the maps of the whole country were completed. The labour involved was, of course, enormous, for after the completion of the triangulation the chain was dragged through every county and parish, township, hamlet and demesne in the United Kingdom, and all the topographical features of the country, both natural and artificial, hill and vale, river and rivulet, roads, railways, woods, plantations, fences, buildings of every description, wells, pumps, isolated trees in fields, in rural districts, and pillar post-boxes, lamps, &c., in towns have received their allotted places on the maps.

TESSERÆ.

Canova.

SO long as he had no living rival in the public favour (it was ten years later that Thiorwaldsen's *Jason* gave the first promise of his future fame), Canova was compared by his admirers to the greatest masters of ancient and modern times; and it was by no means unnatural that the enthusiasm of contemporaries should be disposed to overrate the merits of an artist who like Canova knew so well how to flatter the taste of amateurs, and possessed in an eminent degree those qualities of heart and mind which win universal regard. But it is the privilege of great minds only neither to be intoxicated by success nor disheartened by adversity, and unfortunately Canova cannot be classed among their number. Indications that cannot be overlooked in reviewing his artistic career prove too clearly that he did not escape altogether the influence of the unmeasured flattery of his panegyrists, by whom he was constantly surrounded as a prince by his courtiers. On the other hand, the rare gentleness, modesty and simplicity of his character happily counteracted in a great degree the effects of this unceasing adulation. Many of his works were ranked with the antique. Connoisseurs who piqued themselves on their skill in all the refinements and mysteries of the art preferred his *Perseus* even to the *Apollo Belvidere*. According to them the beauty of this ancient masterpiece had been equalled, while its faults had been skilfully avoided; and when, to the shame of the despoiler, the *Apollo* was carried away to Paris, they ventured to assert that the loss was by no means irreparable. So little did the artist himself shun a comparison with the antique, that when occasion offered he placed the noblest works of Greece beside his own, and seemed to challenge a comparison. When, for example, his *Perseus* was exhibited for public criticism, or rather for public admiration, a plaster cast of the *Apollo* was placed on a lower pedestal beside it, and certainly to unpractised eyes played but an humble part when compared with the marble statue of the Gorgon slayer, aided by all the charms of exquisite finish as well as spotless material, and placed in the most favourable light. In like manner, Glycon's *Hercules in Repose* stood for many years next to Canova's frantic *Hercules*, hurling Lycus into the sea, in order as it should seem that he might place the merits of his furious rival in the most favourable light. Every impartial spectator must have felt the folly, to say the least, of courting such comparisons; but in the first case it was especially unwise, as the artist's misconception of the character of *Perseus* was thereby made the more palpably evident.

Roman London.

Conyers, an apothecary, one of the first collectors of antiquities, gave the labourers who dug the foundations after the Great Fire encouragement to save for him whatever they might find. From the north-east corner of St. Paul's, Fleet Ditch and Goodman's Fields he procured a vast quantity of Roman coins, pottery and utensils, but so mixed with articles of other and later periods as almost to confound inquiry. At the east end of St. Paul's were found pieces of green serpentine and porphyry, such as was used in Edward the Confessor's monument at Westminster, bone or ivory pins, glass beads, heifers' horns and Roman vessels of earth; and between Fleet Gate and Holborn Bridge figures of the Roman household gods, mixed with seals of the Norman period, coins of Vespasian with "Judea capta" on the reverse, spur-rowels, keys, daggers, jettons or church counters, and a coin of Julius Cæsar. From later discoveries better information has been obtained. Beneath the old church of St. Mary-le-Bow were found the walls,

windows and pavements of a Roman temple, and not far from it, 18 feet deep in adventitious soil, was the Roman causeway, above which the present ground has been considerably elevated. In 1711 a cemetery was discovered in Camomile Street, adjoining Bishopsgate. It lay beneath a handsome tessellated pavement, and contained many urns filled with ashes and cinders of burnt bones; with them were beads, rings, a lachrymatory, a fibula and a coin of Antoninus. This, as well as the Roman vault, opened on the rebuilding of Bishopsgate Church, was supposed to have been a burial-place after the establishment of Christianity. That the Romans had a fort as well as a treasury and mint on the spot now occupied by the Tower seems confirmed by a silver ingot, inscribed "ex officio Honorii," found with many gold coins of Honorius and Arcadius in the old foundations of the Ordnance Office in 1777. The ample discoveries that were made nigh the post-office in Lombard Street in 1785, as well as the beautiful pavement discovered by the India House, are additional proofs that London, under the dominion of the Romans, was a little Rome, not only encompassed with strong walls, but adorned with a prodigious number of solid, convenient and magnificent structures.

Damascened Work.

Metalwork of Arab, or so-called "Saracenic," origin is of two very distinct styles. The oldest and most important is of the genuine art, and the specimens that have come into the hands of collectors are generally of its best time, and from the country where it attained its highest excellence. These date from about the middle of the thirteenth century to quite the close of the fifteenth, and have been made chiefly for the kings and grandees of the two dynasties of Memlook kings of Egypt. Many of the men who executed these fine works were no doubt Egyptians, for the Coptic portion of that people have always retained much of the skill of the ancient Egyptians, and they readily adopted the art of their Mohammedan conquerors. But there is also abundant proof, both in the style of some of the specimens as well as written evidence in Arab histories, that skilled craftsmen were attracted to Cairo from all parts of the East, and also from the great cities of Italy, by the riches and liberality of the Memlook court. Objects belonging to this class are not found later than A.D. 1517, when Egypt was taken by the Turks, and the skilled craftsmen of Cairo to the number of some hundreds were carried by the conqueror to Constantinople. Damascened work was likewise produced in Persia, Asia Minor or Mesopotamia, and possibly Damascus. This school appears to have been the origin of a second class, mostly dating from at least two centuries later down to modern times, all the examples of which are inferior to the Egyptian, and exhibit more or less of the decadence of art. The more recent specimens bear inscriptions that appear to be ignorant copies of traditional sentences in common use on such vessels. This kind of oriental work seems to have been made, at least in late times, for the Venetian and other European markets, many bearing coats of arms. There is another class of objects, of rough execution and late work, unlike the preceding, but retaining some of the characteristics of the first style. Their inscriptions are, like those just named, mostly illegible. They perhaps come from Morocco.

Architectural Sculpture of Egypt.

When historic sculpture makes its appearance upon the walls of Egyptian temples it still remains intimately allied with the structural principle; it presents a kind of tapestry, covering the surface but not changing its nature. However minute the execution of his work, however exquisite his observation of nature, the Egyptian sculptor was ever ready to make large sacrifices to the monumental principle. He had marvellous knowledge of the forms which he interpreted, but he was careful not to insist upon all their details. He was content with a large and simple rendering, which, in spite of its archaic appearance, was never false. From this example of complete agreement between sculpture and architecture it results that other edifices seem to lose something of their unity, and our admiration is involuntarily offered towards the supreme expression of the unity of the three arts. This intimate connection between the two is the chief characteristic, the dominant quality of Egyptian architectural sculpture. Statues are sometimes colossal and sometimes diminutive; in the former case they are never allowed to disturb the leading lines of a monument; in the latter they never appear mean, nor take away any-

thing from the grandeur of the whole. All this appears simple enough when we are before the monuments which line the banks of the Nile. It seems to us as if the perfect result had cost hardly an effort, but it is a crowning merit in art to produce great effect without giving rise to any feeling of conscious effort or of pedantry. To those who know how much knowledge and intellectual labour are required to produce an artistic result which shall attract and hold the attention without tormenting the fancy, the magnificent architecture of Egypt must assuredly seem the most "concrete" whole on the surface of the globe.

Taste and Individuality.

The good and the beautiful were in the Greek language often expressed by the same word, and are by many regarded as alike expressing absolute and immutable principles, equally independent of human opinion and equally objects of philosophical inquiry. But, in truth, the object of the so-called philosophy of æsthetics appears, even in its highest form, to have far less of an absolute and immutable character than belongs to the objects of metaphysical inquiry. The beauty of an object appears to depend not so much on the character of the object itself as on the feeling of pleasure which it excites in the spectator, and this, again, on the accidents of his present constitution. The beauty of sensible objects appears to exhibit still more fully the marks of merely phenomenal and relative character. A slight change in the shape and refractive power of the eye would alter all our perceptions of the form and colour of objects, and, with them, the impressions of beauty and deformity derived from this source. And if the senses themselves are confined to the apprehension of phenomena, how can the beauty of the objects of sense lay claim to a higher character? Can we then assert that sensible beauty is a reflection and imitation of ideal beauty, in the same manner and degree in which our perceptions of moral duty aim at and imply a divine standard of right and wrong? Even the fluctuation in the opinions of various individuals and nations, though far from being a decisive criterion in any case, appears to be acknowledged by the general sense of mankind to be a test more conclusive in questions of taste than in those of truth or rectitude. The very name taste seems to imply something subjective and to a considerable extent arbitrary. The maxim "*De gustibus non disputandum est*" may be the exaggerated expression of a popular conviction; but, at any rate, it carries no such shock to the natural feelings of mankind as does the sophistical assertion that the distinctions between truth and falsehood, virtue and vice are based on convention and not on nature. Nor is it difficult to detect the foundation of truth which underlies the exaggeration. The maxim is true in so far as it virtually asserts that beauty is subjective not objective—an affection of the person who is conscious of it, existing only in and by that consciousness, not a permanent quality existing in things and capable of being expressed by a general notion. But it is exaggerated, in so far as it apparently denies the existence of a common sense of beauty among men of cultivated minds, by virtue of which similar affections will be produced in different minds by the same object.

GENERAL.

The Statue of Gainsborough by Sir T. Brock, R.A., which was shown at the Royal Academy this year has been placed in the sculpture hall of the National Gallery of British Art, Millbank.

Sir Arthur Rücker unveiled on Saturday a marble tablet which has been erected in Yattendon parish church in memory of the late Mr. Alfred Waterhouse, R.A., by the parishioners and many friends and old pupils. There was a large and representative gathering, and Sir Arthur Rücker delivered an address on the lifework of Mr. Waterhouse, declaring that his aims had been lofty and elevating.

Sir John Puleston, custodian of Carnarvon Castle, will shortly visit Carnarvon and discuss with an architect the alteration which may be considered desirable in connection with the King's restoration scheme. After its restoration the Castle will be used by members of the Royal Family.

The Council of Leipsic have voted the sum of 600*l.* towards the 2,000*l.* required for the Bach monument which is to be erected in the Thomaskirchhof, after the removal

of the statue of the philosopher Leibnitz which at present stands there. The sculptor is Professor Karl Seffner.

Mr. T. Francis Bumpus having completed his "History of the Cathedrals of England and Wales," the third and final volume has been published by Mr. Werner Laurie. The contents include Lichfield, Gloucester, Rochester, Carlisle, Oxford, and a number of the minor cathedrals. The book is illustrated with thirty-two plates in two colours.

The National Affiliation of Goldsmiths, Jewellers, Silver-smiths, Electro-plate and Britannia Metal Workers have sent a resolution to the Sheffield education committee urging that the only sure way to secure thorough efficiency in workmanship and a higher standard of art production in the trades represented by the Affiliation is to confine the teaching in our schools of art to those persons engaged in or working at the trade, either as apprentices or artisans.

Two Stained-glass Windows have been erected in St. Stephen's Church, Clewer, Windsor. The vicar, finding that the artist had put his name in one corner of them, insisted on its being instantly removed. In this month's parish magazine the reverend gentleman says it is just what monumental masons will do with tombstones if you let them—put their names on—but he never allows that sort of thing. A window or a tombstone, he adds, is intended for the glory of God and a memorial to a departed friend, not as an advertisement to a tradesman or an artist.

The Chester County Council recently requested the London and North-Western Railway Company to make alterations costing 600*l.* to the room in the Company's hotel at Crewe used by the Council for committee meetings. No agreement being arrived at on the subject the county committee have instructed the county architect to prepare and submit to a future meeting modified plans for a building with the necessary appurtenances in which the meetings of the committee can be held, and also a caretaker's house, at a total cost, exclusive of land, not exceeding 4,000*l.*

The North Side of Ripon Cathedral has just been adequately protected from the ravages of damp by work in cement concrete, carried out under the supervision of Mr. H. Williams. The gargoyles have been made to deliver the water from the roof over a much smaller area, and the broad flooring of cement concrete at the base of the walls effectually keeps out the moisture, which was finding its way into the interior of the building. It is hoped the work may be extended to the east end of the cathedral. The walls have also been underpinned. In the course of the work Mr. Williams came across what he believes to be the foundation of the old Norman cathedral, as the stone exactly corresponds with the stone in the Norman crypt.

The Design for the new buildings of the Boston Museum of Fine Arts has now finally been approved. It has been prepared by Mr. Guy Lowell in consultation with Messrs. E. M. Wheelwright, R. C. Sturgis and Professor D. Despradelle, and embodies the conclusions of a committee which with the staff of the museum has been at work on the subject for more than three years.

The Society for the Propagation of the Gospel in Foreign Parts have sold their premises in Delahay Street, which they have occupied for thirty-five years, to the Government for the sum of 27,500*l.* They have secured a site with an area of 6,000 square feet for a new structure in Wood Street near the building lately erected by the Ecclesiastical Commissioners. Designs have been prepared for the new premises, the cost of which will exceed 20,000*l.*, by Sir William Emerson.

The Board of Works recently leased from Berwick Corporation a section of the old fortifications, including the Bell Tower, the large stone fort fronting the sea, and two surviving fragments of the crumbling Edwardian walls. The Berwick Historic Monuments Association, of which Sir Edward Grey is president, has been formed for the preservation of the Elizabethan ramparts, and is now engaged in opening out the flankers of the bastions and clearing away the accumulated rubbish that has obscured them for a long period. These flankers are eight in number, and may be described as open quadrangular courts of masonry, measuring about 30 feet by 90 feet, extending between the curtains and the wings of the bastions, each comprising three walls of good ashlarwork about 15 feet high, while the fourth side is open towards the main ditch. These open courts seem to be peculiar to Berwick ramparts. The Association desires to restore the decaying stonework and open out the underground passages.

The Architect.

THE WEEK.

IN one of the late CHARLES KEENE's drawings a member of the hanging committee of the Royal Academy is supposed to be saying to a young artist whose pictures were not accepted:—"You'd be surprised, sir, at the accuracy and rapidity with which, from long practice, we can decide at a glance on the—ah!—merits of the pictures as they pass before us!" Confirmation of the old gentleman's statement is afforded by the official report relating to this year's exhibition. Out of 11,789 works received 8,806 were at once rejected, and practically the exhibition consisted of a selection from less than 3,000 works. In the catalogue there are 1,799 works of all classes; of that number, 203 were contributed by Academicians and Associates, and consequently there were less than 1,600 from those who do not possess a claim on the walls. As very few artists were able to exhibit three works, as allowed, it would appear as if a further reduction of the numbers sent by members of the Academy is indispensable in order to allow more justice to be done to outsiders.

THE late LOUIS FRANÇOIS BOITTE, who died last week at Fontainebleau in his seventy-sixth year, had not of late years opportunities to display his power as an architect, but he was greatly esteemed by his fellow artists. During several years he was afflicted with blindness, and a privation of that kind bears harder on an architect than on the majority of men. At one time it was anticipated that he had a great career before him. A pupil of BLOUET and QUESTEL, he won the Prix de Rome in 1859, when the subject assigned was a Palais de Justice. During the tenure of the appointment he prepared reparations of some Greek buildings. He was selected by PAUL DUBOIS, the sculptor, to design the architectural part of the memorial of LAMORICIÈRE in the cathedral of Nantes. In 1877 he was entrusted with the charge of Fontainebleau, and any restorations in the building since that time were carried out under his direction. He also served as supplementary professor of the history of architecture in the Ecole des Beaux-Arts.

JUDGING by reports of late meetings of Trades Councils, efforts will be made to compel corporations to expend larger sums on the building of houses for the working classes. In Birmingham it was said that the repairing which the housing committee had undertaken had the effect of increasing the rent of small property. In that city there are from 30,000 to 40,000 back-to-back houses, which is considered discreditable. The Corporation of Liverpool has been active in erecting cheap houses. But one of the speakers at the Trades Union Congress described them as monotonous and ugly, and destined within a few years to become mere slums. It might be imagined from what was said that there was no difficulty in obtaining a superior class of houses with land attached which could be let cheaply. Most of the houses which have been erected by corporations, although they do not produce any sensible profit, are considered too small and insufficient in their accommodation. But who was to bear the loss of a higher style of residences was not explained by the orators.

THE report of the Trustees of the National Portrait Gallery records the acquisition of a few portraits which have special interest for architects. One represents A. W. N. PUGIN, but there is uncertainty about the painter. A plaster cast of ALFRED STEVENS, the sculptor of the Wellington monument in St. Paul's, is taken from the death mask by Mr. REUBEN TOWNROE. An unfinished portrait of himself by G. F. WATTS

has been accepted. A crayon drawing of J. A. SYMONDS, author of the "History of the Italian Renaissance" and other works relating to the artists, is another addition. The Trustees state that owing to the congested state of the galleries, the difficulty of finding space on the walls for the proper exhibition of recent acquisitions continues to increase, and the attempt to maintain a chronological and historical arrangement of the portraits will soon become unavailing. The Trustees have been in further communication with the War Office as to the future disposition of the site now occupied by St. George's Barracks, but up to the date of this report no reply has been received from the military authorities. It cannot, therefore, be said that the Trustees have any immediate prospect of obtaining the extension of the gallery which has become of such urgent necessity. The number of students who applied for students' tickets during the year was fifty-three, and fifty-eight students had their tickets renewed. The total number of visitors to the gallery during 1905 was 168,769, which showed a satisfactory increase on every day in the week, the total being the largest since 1896, when the new gallery was opened. The total number of visitors admitted on Sunday afternoons during the summer was 13,411, giving an average of 432 per Sunday.

THE decoration of the apse of St. Cuthbert's parish church, Edinburgh, is too important an event not to be noticed. It is evidence of a further advance from the whitewashed walls which at one time were considered essential in Scottish churches. The principal feature of the decoration is a reproduction in high relief of DA VINCI'S *Last Supper*. The figures, which are almost of life-size, are in white alabaster, and the work is arranged in three divisions, separated by red pilasters. Coloured marbles have also been used in connection with the decoration. The roof of the apse has been adorned by painted figures. The designs were prepared by Mr. H. J. BLANC. The Rev. Dr. MACGREGOR, in the sermon delivered at the reopening of the church, said, as far as art could do it, they had symbolised the central facts of the Christian faith in that one apse.

UNDER the Waterworks Clauses Act, 1847, persons who construct waterworks are subjected to a special set of rules in cases where their operations bring them into conflict with mine-owners. If the owner of mines or his lessee wish to work any mines within 40 yards of the waterworks they must give thirty days' notice of their intention to do so. If on receipt of the notice the waterworks company think that the working will injure their undertaking they may stop it on the terms of paying compensation. If they do nothing the mine-owner may work his mines in the usual way, and is not liable for damage caused, provided that it is not caused by working the mines in an unusual manner. The effect of these provisions was discussed in the case of *The Mayor, &c., of Manchester v. The New Moss Colliery, Ltd.* In that case the plaintiff supplied Manchester with water under a special Act which incorporated the Waterworks Clauses Act 1847. For the purposes of their waterworks they had purchased land for a reservoir. The defendants, desiring to work their minerals, gave the notice required by the Act of their intention to do so. The plaintiffs took no steps to stop the working, which was therefore proceeded with. As the result, a subsidence was caused on account of which the action was brought. The Court of Appeal, reversing FARWELL, J., held that as the subsidence would have been caused whether the reservoir had been there or not, the plaintiffs could recover damages for the infringement of their common law right to support. The special provisions of the Waterworks Clauses Acts are alternative to, and not in substitution for, the common law rights of neighbouring landowners to support.

PUBLIC HEALTH IN LONDON.

THE monk FITZSTEPHEN, in his description of London as he saw it in the twelfth century, said it was more ancient than Rome, and the two corresponded in using the same ancient laws and ordinances. There were sheriffs instead of consuls, senators and inferior magistrates, and "also sewers and aqueducts in its streets." The connection may appear strange, but to FITZSTEPHEN the sewers and fountains were remarkable objects which testified to the existence of an organisation then unparalleled. Since that time sanitary works have become more general, but apparently it is the office of London to set an example in sanitation which other cities and towns can imitate, although they are never likely to surpass the works in efficiency.

It suggests the clear idea existing about the purpose of the works when we find that they are controlled by the Public Health Department of the Corporation. The report of the engineer, Mr. FRANK SUMNER, on the works executed last year is therefore an interesting document. In considering it we must remember that London in old days resembled ancient Rome in having narrow streets, although the advantages of broad highways were admitted. The result is that the conditions under which public works are to be executed are occasionally more onerous than they would be in a city laid out according to modern experience.

The immense traffic does not allow of much interference. If we remember that over a million people enter and leave the City daily, and that more than 300,000 pass the day within the City, the slightest impediment to their motion is resented. For instance, by-laws were made relating to the demolition of buildings. But it has been found that they can only be enforced with difficulty. Owing to the crowds in the streets building operations are more costly than in other places. Mr. SUMNER remarks that two new systems were introduced for cleansing the front of buildings: one by means of sand projected against them by a blast, the other by a steam jet. There is no city in the world where such operations are so desirable as in London, and every facility should be afforded. But, according to the engineer, "serious complaints have been received against both systems: as to the first, of the inconvenience to pedestrians caused by the sand falling on them, and in the other case by the dirty condensed water." In these, as in many other instances, each individual thinks only of himself or herself, and the fall of a grain of sand is resented as if it were an avalanche. The same spirit is manifested in the grumbling against street works. And from what is said it might be imagined that Corporation officials carried out works for their own amusement.

Although London is claimed to be the foremost city of the world, no less than eighty-one buildings were condemned last year as dangerous. Yet for purposes of improvement every square foot of ground is found to have extraordinary value. The improvements and finance committee had to expend 57,050*l.* during 1905 in purchasing property for which 79,964*l.* was claimed. At the end of the year claims amounting to 29,811*l.* were under negotiation. Those who talk about improvements of the streets as if they could be accomplished without difficulty should remember the price obtainable for small areas of land in the City.

London streets may be regarded as experimental stations for paving. The Corporation have in use granite, macadam, York stone, various kinds of asphalt, and wood. In some cases pavements have to be maintained by the contractors during a period of fifteen years. Lighting is also of a varied kind. In most of the main thoroughfares arc lamps are used. The cost of each is 26*l.* per annum. It was only necessary to light them on twelve days when there was fog or unusual darkness. Incandescent gas-lighting is deemed suitable for side streets. High-pressure lamps were erected of 2,000 candle-power, one in St. Martin's-

le-Grand and the other in Fleet Street, opposite Fetter Lane. It is stated that "the essential feature of this system is the compressing of the gas before it enters the burners to a pressure capable of supporting a column of water 10 inches high by means of a small hydraulic ram fixed in some convenient position. The ram is actuated by the water from the street mains, and the gas is taken from the services, and the pressure increased as required. The speed of the apparatus and the flow of the water is regulated to the exact requirement by means of a governor, or in streets where the gas company have high-pressure mains the services are connected directly thereto; this latter system for street lighting is preferable, firstly, on the score of expense, and, secondly, it not being likely to fail."

The water consumed by the Public Health Department is charged for at the rate of 6*d.* per 1,000 gallons. The total amount expended on water came to 4,372*l.* 5*s.*, of which sum 1,926*l.* 7*s.* 8*d.* applied to the washing at night of courts and carriageways. The quantity of water used for that purpose was during the year 61,953,459 gallons. The cleansing of the streets begins at 8 P.M., and before 6.30 A.M. practically the whole of the City is washed or cleansed by water. The work is carried out systematically, beginning with streets near markets or where business is resumed at an early hour. In the winter the use of grit to facilitate vehicular traffic during the day-time renders the flushing and washing rather difficult. To meet the difficulty the water is supplied in force through a jet and hose, and additional flushes are sometimes used. In winter when there is a possibility of frost less water is used, and sometimes street washing and flushing has been suspended. The main streets and bridges leading to the various markets are regularly gravelled to avoid as far as possible any loss of time in the produce arriving at its destination through bad travelling. House refuse has to be removed by 10 A.M., and to execute this work every available horse, van and man attached to the cleansing department must be utilised. In September 1904 the order for occupiers to place refuse on the kerb by 8 A.M. came into operation. There was some difficulty at first. But after a few months the advantage of the arrangement was realised, and many main streets are now cleared by 9 A.M. The number of *employés* on the cleansing staff is 727, including 193 boys. The work cannot be unhealthy, for only seven of the men died during the year. In connection with the cleansing six motor vans are used, each of which can move on an average 37 tons 13 cwt. The cheapest were obtained from the St. Pancras Ironworks. The Corporation possess property at Hornchurch, Essex, on which the refuse is deposited. A contract has been entered into for a concrete wharf wall fronting the river, 400 feet long by 23 feet 2 inches wide, with a return wall of 250 feet by 15 feet. The refuse will be brought by barges from a London wharf.

It is to be desired that the Corporation could be as successful in cleansing the atmosphere as they have been with the streets. Care has to be taken that no injury can arise from the immense number of overhead wires. The Corporation in 1899 undertook the supervision, and up to last year 22½ miles of wire were removed. In 1899 there were 260,000 spans crossing public thoroughfares, and last year the number was 699,300. It is pointed out that owing to the acids formed in the smoky City atmosphere the corrosion of exposed metal proceeds far more rapidly than is generally supposed, and the galvanising applied as a protection to pole-stays and cable-suspending wires does not last long.

It is to be hoped bronze castings on buildings will have a better fate and a longer term of existence. FITZSTEPHEN said that one would think, with HERACLITUS, that all things were in motion when one visited the horse shows of London. The words are:

now more generally applicable, for it must be said that the Corporation and their officers no longer follow an easy-going policy, and are striving with might and main to keep London ahead of the rest of the world.

THE GEOLOGY OF SLATE.

AFTER hearing about the destruction of San Francisco and Valparaiso the youngest child must realise that this earth, which appears so stable, is liable to convulsions from some force which is not visible. At the present time much is also said about the wasting of the land through the operation of the sea. A child who has received a few elementary lessons in geology would be excused if he maintained that the earth, especially as we see it in England, mainly owes its formation to a similar cause. Given unlimited time it seems an easy operation to remove the ground in one place and to transfer it to another. In other words, the navvies' labour in making cuttings and embankments on railways is a type of what has been done by aqueous force in imparting to the earth its present character. Included in that force we should be allowed to comprise the immense work accomplished by glaciers and other inorganic agencies.

If, however, the Neptunian theory were alone exemplified in the formation of the globe, the surface would present a very monotonous character to the inhabitants. All that can be done by water is limited in constructional power. It would not be a pleasant spectacle to have immense plains resembling the sands on the coast, even if they were occasionally varied by the footprints of the beings which traversed the surface. A large expanse of clay gratifies the eyes of agriculturists, for its unvarying character is suggestive of fertility. But a country or a district which could show nothing else would not, in our day at least, be visited by pleasure seekers or by landscapists if any could exist under such conditions. Fortunately for the modern inhabitants of the earth, although at one time the exhibition was marked by terrible destruction, igneous forces like those which were in operation at Valparaiso and San Francisco have given a marvellous variety to the appearance of the earth's surface. Granite may be modern as well as ancient in its manifestation. But wherever it occurs it has put an end not only to monotony of appearance, but to the regularity of stratified beds. The newspapers have related tales of horror about what happened in America. But to a geologist, and especially to those among them who consider themselves to be Plutonists, the destruction on the American coast must seem as only the puny efforts of a force that may be decaying, or was able to put forth only an infinitesimal degree of power. When one thinks of the dynamic force which was needed to twist and fuse every cubic inch of a mountain, and by which the neighbouring strata from their contortions suggest a crisis in the earth's existence, the mere unsteadyings of the foundations of a few skeleton structures seems unworthy to be classed among geological phenomena.

We may also measure the extent of the force that once prevailed by its effect on what are now called metamorphic rocks. There are, among other varieties, some resembling rough glass, and we may therefore conclude that they owe their origin not so much to a mechanical force, although that was also in operation, as to immense heat accompanied by chemical operations. The power which was required to produce trap and basalt further shows that in the interior laboratory of the globe it is possible to accomplish a great many novel and surprising operations.

It is necessary to recall these facts if we would understand the nature of an ordinary roofing slate. Clay slate is to be found in the lowest strata we have in England, that is to say, in the Cambrian. We need not consider the question which once gave rise to very angry disputes as to whether SEDGWICK'S Cambrian

is not still older than Cambrian. The Skiddaw slates are evidence that in the North of England, as well as in Wales, clay slates were produced by similar causes. Nor need we investigate the problem of the origin of the fine clay or silt of which they are in great measure composed. The chief fact remains that clay slate is of incalculable antiquity.

There is a wide difference between a slate and a slab of clay slate. The latter sometimes contains fossils. But it is very doubtful whether a fossil is to be discovered in a true slate. If trilobites or annelids existed in the days when the globe was young, all traces of them were likely to disappear in the operations necessary for the production of slate. The characteristics of a slate are so peculiar we cannot suppose that the same kind of process was often employed under other circumstances. We once saw a definition by a so-called practical man, according to which a slate was a bluish fossil stone, very soft when dug out of the quarry, and therefore easily cut or sawed into thin long squares to serve instead of tiles for the covering of houses. We must expect to meet with a large amount of nonsense in all that relates to the application of geology. But the above description is ridiculous. What makes the slate so useful in building is that nature was beforehand in preparing it, and that great masses of slate rock were subjected to some sort of treatment which resulted in the property commonly known as cleavage. What is perhaps most remarkable about it is that the cleavage was not always uniform. It is possible to find slabs of good size which will serve for roofing if the timber which supports them is of adequate dimensions. But the genuine slate has been so well prepared it can be split to the thinness which makes it such a valuable commodity in the market. Slates may be obtained which are one-eighth of an inch in thickness and which are as close-grained as a plate of steel. By modern machinery marble can be cut for veneering equally thin. However, the thin slate is produced owing to its fissility by the use of very simple tools.

We have just compared a slate to a steel plate on account of its closeness. There are other resemblances between them. The tensile and compressive strength of a steel plate, bar or angle-iron can be calculated to a nicety. It is assumed that steel is competent to withstand either force. Now, it is noteworthy that some of the physicists who studied cleavage arrived at the conclusion that it was owing to immense compression in one direction and immense tension in another. We know with girders that, when loaded, the strain assumes the form of a curve, and it is very remarkable that DARWIN, who could not have anticipated the experience of engineers, came to the conclusion from what he saw in South America that cleavage planes were likely to follow great curves, which were, however, of such radii that any view of them which could be obtained must appear straight. The use of the word "plane," although theoretically a fallacy, was in reality borne out. The force employed to produce cleavage was so intense that the minute particles of which a rock was composed were rearranged. Formations are made up of a variety of rocks, and the cleavage force acted on all indiscriminately. One very curious result is that if any of the beds should be fossiliferous the fossils are distorted, and are sometimes a puzzle to palæontologists.

It is impossible as yet to make out the changes which have been produced on the American coast through the recent disturbances. Apparently there was only a slight upheaval in some places and a slight depression in others, although the consequences were so serious. The scientific commissions appointed to investigate the subject will no doubt increase our knowledge. Man is the heir of all the ages, and in a wider sense than is commonly supposed. It may be presumptuous to believe that all the revolutions of geology were accomplished for our special benefit. It is, how-

ever, certain that men have had the ability to turn them to account. What a fearful destruction of fresh-water beings is testified by every block of Purbeck marble! And the common use of the word bone-bed shows that even ignorant quarrymen could not close their eyes to what is undoubted historic evidence of the existence of organic life formerly of which the utility did not cease with death. "The dust we tread on was once alive," is no mere poet's discovery; it expresses a geological fact; and thus in marbles remains of living beings enable us to ornament our buildings. It was believed by BISCHOFF that all marine limestones are due to the powers of organic life, and from what was calculated by DARWIN respecting the agency of the earthworm in the formation of soil, BISCHOFF's theory now appears less incredible than when it was first expressed.

ENGLISH CATHEDRALS.*

IN his description of Gloucester Cathedral Mr. BUMPUS tells us that when he first entered the building WESLEY'S "Te Deum" in E burst forth, and that he and his friends sank for preliminary devotions into stalls which were pointed out by a venerable verger. The incident is characteristic of much to be found in the three volumes relating to the cathedrals of England and Wales. To tell of all he felt and all he saw to the people of his native village was the ambition which was never realised of OLIVER GOLDSMITH, and when a writer can supplement his observations with a record of his feelings he goes far towards making his pages a success. Ordinary guide-books can furnish particulars of the history and arrangements of particular buildings. But knowledge of that kind, however useful and interesting, is rarely sufficient to captivate a reader. We may compare the area of the base of the Egyptian Pyramid with the area within the railings of Lincoln's Inn Fields. But we would gain a nearer approach to reality from a few words of a sensitive writer relating the impressions which the first sight of the Pyramid made upon him. From Mr. BUMPUS'S pages we can imagine the impressiveness still retained by the old buildings, and its operation on one worshipper at least; and we may suppose there are many others equally susceptible to form, purpose and history. On that account we must not expect uniformity of treatment. Mr. BUMPUS often prefers one part to another, and he is within his rights to make that part stand out more prominent.

The third volume treats of the following subjects:—Lichfield, Gloucester, Rochester, Carlisle, Oxford, Llandaff, Bangor, St. Asaph, St. Davids, St. Albans, Ripon, Manchester, Truro, Southwell, Newcastle, Wakefield, Liverpool, Birmingham and Southwark. Much else besides the architecture is noticed in each case. Thus it is pointed out that "in few cathedrals in England are certain of our older anthems with their elaborate solos and verse parts given with so fine an effect as in that of Lichfield." Visitors are reminded that they should attend morning service on a Sunday, Wednesday and Friday to hear the chanting. One of the priest vicars was the Rev. THOMAS HELMORE, whose name will be ever associated with Church music. In describing Gloucester Cathedral WALPOLE'S story is introduced of Mrs. COTTON'S pew, which contained two troughs of a birdcage with seeds and water. The good lady believed that her daughter's soul passed into a robin redbreast, "for which reason she passed her life in making an aviary of the cathedral at Gloucester. The Chapter indulge this whim, as she contributes abundantly to glaze, whitewash and ornament the church." The anecdote throws much light on the treatment of cathedrals in the eighteenth century. The description of Oxford Cathedral allows Mr. BUMPUS to say a few words about Dean ALDRICH, who was an architect and a composer as well as a logician:—

Aldrich, styled by Macaulay "a polite though not profound scholar, and jovial, hospitable gentleman," issued in 1691 a small treatise on logic, "Artis Logicæ Compendium," which long continued the popular textbook. As an architect he designed the Peckwater quadrangle at Christ Church, All Saints Church in the High Street, and in all probability the chapel of Trinity College in conjunction with Wren, and wrote "Elementa Architecturæ Civilis ad Vitruvii Veterumque Disciplinam," translated in 1789 by Rev. Philip Smyth, Fellow of New College, under the title "Elements of Civil Architecture according to Vitruvius and other Ancients." As a musician Aldrich was a prolific composer of services and anthems, many of which are still in use in "quires and places where they sing." His well known catch, "Hark, the bonny Christ Church Bells," first appeared in 1726 in the *Pleasant Musical Companion*, also his "Smoking Catch, to be sung by four men smoking their pipes, not more difficult to smoke than diverting to hear." The Dean's passion for the fragrant weed is illustrated by a story of a student who betted that he would find him smoking at 10 A.M., and who lost his bet because Aldrich was not smoking, but filling his pipe.

The Welsh people are musical, but Mr. BUMPUS has not been able to say anything about their cathedral services—possibly they are less important than in England. There is a similar omission in the account of St. Albans. Southwell, however, possessed six vicars choral, six singing men and twelve choristers—a large choir for a parish church. Choral service is now performed twice daily. There can be little doubt that in the planning of many cathedrals arrangements were made to increase the effect of chanting the services, and under altered conditions the tradition continues to be respected. In giving attention to organs, vicars choral and choristers Mr. BUMPUS is not introducing foreign matter, although in other books on cathedrals architecture alone is considered. The three volumes now form serviceable guides, which also can be read with interest in the intervals between the visits to the cathedrals.

TOURS IN ENGLAND, 1768-9.

AMONG the manuscripts at Gorbamby, near St. Albans, belonging to the Earl of Verulam, are a diary of a northern tour through a part of England in 1768, and another relating to a journey through the Midlands into Wales in the following year. The manuscripts are not signed, but it is believed the traveller was the third Viscount Grimston, who was in 1790 created a peer of England and an earl in 1809. It is evident from his accounts that his lordship was able to appreciate architecture, especially as manifested in the country residences of his friends. At the time there was a desire to have large mansions, for Blenheim and Castle Howard, with other buildings, had superseded the regard for the older style of buildings which was so long in favour.

The writer of the diary started from St. Albans on August 18, 1768. The first mansion he notices is Wooburn Abbey (Woburn), belonging to the Duke of Bedford. He describes the house as "situated in a bottom, fronted by 10 acres of water, back of the house defended by a grove; entrance of ditto a hall, on one side of which a bedchamber and dressing-room, on the other coffee-room; above stairs seven grand apartments, viz. dining-room, drawing-room, state bedchamber and dressing-room, French room and dressing-room, picture gallery; the whole house ornamented with silks, stucco and gold." On the next day he came to Castle Ashby, the seat of Lord Northampton, which in his eyes was without beauty or anything to recommend it. Lord Strafford's house at Boughton was old and not worth observation. Evidently the traveller set out with a prejudice against antiquity.

The streets of Nottingham, with the exception of the market-place, he says, were rather narrow; the latter was spacious and full of good buildings. The castle raised on the summit of the rock on the south-west of the town commands a prospect of the whole town, the river Trent and the four counties near adjoining; the castle itself is of stone, rooms lofty and but ill furnished; a terrace surrounds the whole, and in miniature nearly represents Windsor Castle. He remarked that many of the poor inhabitants on the east of the town, by scooping out the rock, make use of it for houses; the cellars in this town are remarkable by being

* *The Cathedrals of England and Wales.* By T. Francis Bumpus. Third Series. (London: T. Werner Laurie.)

dug a great depth into the rock and extending themselves a considerable distance.

Two miles from Nottingham was Wollaton Hall, which he visited. It is said to be a stone Gothic building with four towers and a tower raised in the middle. The offices were built of brick fronted with stone. In Derby he found the streets regular and making a good appearance.

Four miles from Derby was Kedleston, belonging to Lord Scarsdale. As it was a new building it was sure of the Viscount's admiration. He speaks of it as a most noble modern-built house of stone, with twenty-six windows in front; the entrance is a large hall supported with twenty pillars of Derby marble, many of them one entire piece; on the right of the hall, eating parlour, ornamented with pictures by the best hands, pier glasses, &c.; beyond this, print gallery; on the left of the hall a music-room, dimensions 24 yards by 16, most elegantly adapted for the purpose; beyond this drawing-room, ornamented with all the power of art; beyond this a complete library, each room filled with noble pictures, both of landscapes, sea-pieces and portraits. The park was not laid out, but it was anticipated by the traveller that "the grandeur of the house, the beauties which there must be in the park when finished, and the civility and politeness of the possessor unite to make it the best worth seeing and the most agreeable seat in this part of England."

At the time there were three hundred people employed in a silk manufactory in Derby. The Viscount's journey was by Ashbourne, Okeover (where a large brick house had been built by Mr. Okeover which contained a *Holy Family* by Raphael), Buxton, Disley, to Manchester. He describes Manchester as very handsome, full of good houses, well paved, and carrying on a great trade in tapes. But the chief attraction was the new Bridgewater Canal, cut through, in many places, the solid rock for the distance of 37 miles, for the convenience of water carriage. This work, he considered, would be justly called one of the wonders of the world, exceeding in magnificence, use and grandeur every work of that kind, and proving indisputably the judgment, caution and courage in making the attempt of the noble contriver. The traveller was disappointed when he found that the Duke of Bridgewater, who could carry out so remarkable a work, only built a small house at Worsley for convenience rather than magnificence. Returning from Manchester to Disley, Chatsworth was visited. It is said to be "a square stone house and windows in front, which appears magnificent; the inside of the house not answerable to the grandeur of the outside. The furniture old and principally tapestry; the park, which would be naturally barren and dreary, is made agreeable by plantations and water. This place is principally remarkable for water-works which were made by the first Duke of Devonshire."

The road by Bakewell, Matlock, led to Hardwick Hall, "the house itself very old and built after the manner of a castle," and to Newstead Abbey, belonging to Lord Byron. It is described as "of a very old date and carries the appearance of an abbey. On the front is a very large and fine piece of water, flanked on each side with a fictitious battery; above this on a rising piece of ground is a building to represent a castle, with four great guns on a rampart; on each side of this a large plantation. Near the house is a cascade which is supplied from this water and is intended to lose itself in another behind the house of yet larger extent. This water is made more beautiful by a number of small vessels being stationed on it. The rooms in the house are very small and ill proportioned, but this is abundantly made up by the very fine collection of paintings, and the taste that is shown in placing them to the greatest advantage."

Passing through Sherwood Forest the traveller came to Welbeck, belonging to the Duke of Portland. The house is of an old date, but at the same time very habitable and rather magnificent. The pictures are almost all family paintings by the best hands. The park is very extensive and, in some parts, is much beholden to art for its beauty. The next stopping-place was Worksop, belonging to the Duke of Norfolk. According to the Viscount, "the appearance of the house is most superb, being built with stone. Twenty-four windows in front at present, though there is an intention to add two more wings. The front prospect is a fine piece of water, with a lawn prettily interspersed with a plantation of firs. The inside of the house will be equal in magnificence to the outside, but is at present without the proper furniture, excepting one room which is filled with family pictures and hung with the finest tapestry." Clumber, which was Lord Lincoln's mansion, was not

finished, but promised well. There were nineteen windows in front, the middle a bow and two projecting wings. Thoresby, the Duke of Kingston's, was also unfinished, but appeared adapted for convenience rather than magnificence, the quality most desired in a lordly mansion by Lord Verulam.

The tourist arrived in York on September 6. He admired the gates, and the cathedral, castle and assembly room were worth seeing. The cathedral was allowed to be a most noble Gothic building, of immense length, the windows all of painted glass and well preserved. He was evidently surprised at seeing the communion-table raised above "the common level" by twelve steps. The assembly room had existed for half a century, and was designed by Lord Burlington, but the traveller either did not know nor was it generally understood that the design was an adaptation of one by Palladio, for we are told "the assembly room fronts London Street; this room is, of its kind, the most magnificent in England, designed by Palladio, the architect; it is 120 feet in length, 40 feet in height and the same in breadth, supported by forty-four Corinthian columns of York stone and illuminated by forty-four large glass chandeliers. Parallel to the great room, half its length, is a tea-room, made use of in winter to dance in; beyond this is a concert-room, and to conclude the whole is a very good kitchen." Although Castle Howard had been erected from Vanbrugh's designs about seventy years earlier, the traveller was not apparently acquainted with that vast structure. He records that "the entrance into the park is through a magnificent gateway, on each side of which is a stone building made use of as an inn. From hence an avenue, with double rows of trees, in the middle of which an obelisk, on the right hand of which is the house. The north front is a magnificent hall, with a cupola, on each side of which hall is a long range of building. The approach is up a grand flight of stone steps; in the hall are many antiques, brought over by the late Lord Carlisle. On the cupola is painted the Fall of Phaëton, over the chimney Hercules, on each side of the hall the Four Seasons. The rooms are very numerous, very small in proportion to the size of the house. The furniture is of an old date, but exceedingly superb. Every room that will admit of it is filled with antique busts, urns, vases, mosaic pavement, Roman tiles and every curiosity that could possibly be procured by the late Lord Carlisle. Indian chests and cabinets, the most rich, in which ornament rather than convenience has been consulted. From the house you are led through some wood walks to the temple, which is a single room with a cupola on the top, built on Ionic columns. This room is made use of sometimes to drink tea in. From hence you are carried to the mausoleum which was built for a repository of the remains of the Howard family. This building is of a circular form surrounded with a low stone wall. In the lower room, or rather vault, niches are cut in the wall for the reception of the coffins, six of which are filled up. Above this another room, made use of to perform the burial service in; this has a very grand and rich cupola for its roof. The whole is supported by Corinthian columns of immense size. From this building you have, on one side, a view of a stately stone bridge built over a large piece of water; on the other side a most extensive wood limits the prospect. The whole park is ornamented with variety of small buildings and great quantity of plantation."

Another new mansion was Duncombe Park, of which he says:—"The front of this house built in the Ionic order looks on a spacious lawn, limited on each side by a sloping wood. The other front built on four Ionic columns is approached to by means of a flight of steps, and looks on some pleasure ground laid out, some time since, into walks; from hence there is a noble terrace formed by nature and assisted by art. At the end of this walk is a temple with a dome prettily ornamented with frieze [frieze] in pure gold, with four niches in the wall filled by as many statues; the whole is supported by Ionic columns. The entrance into the mansion house is a hall ornamented with Corinthian columns, a handsome light ceiling and four antique statues. The dining-room is handsome and filled with the best of pictures by Carlo Marratti, Guido, Titian and some of later date. Beside this is a drawing-room, bed-chamber, dressing-room and saloon, all of them furnished with the same kind of ornaments." Studley Royal, then belonging to Lord Grantham, was found to be of stone built on four Ionic pillars. Harewood House, designed by Adam, was then in progress. It is described as "built on Corinthian columns, with two wings with thirteen windows in

front. The whole makes a very grand and magnificent appearance. The rooms are to be finished in the most superb style, and in the manner Mr. Lascelles goes on, bids fair to be one of the most magnificent buildings in Yorkshire."

Leeds is said to be "very large and populous but exceedingly dirty, ill built and as badly paved." The Cloth Hall measured 118 yards by 67 yards, was lighted by 167 sash windows and contained 1,589 stands. Wakefield and Barnsley were next visited, and three miles from the latter was "Wentworth Castle, a seat belonging to Lord Strafford, situated in a park four miles in circumference. The house is a noble building with fourteen windows in front. In the centre are five Corinthian fluted columns which add great magnificence to the appearance. One front is taken up entirely with a long gallery filled with the best pictures. In the other apartments convenience and grandeur are both of them consulted. Lord Strafford himself is his own architect and contriver in everything." Sheffield was described in the same words as Leeds, but it was more disagreeable through the excessive smoke from the great multitude of forges. Birmingham was well paved, and had many good houses in the upper part of the town. The buildings in Coventry being ancient, the town made but a mean appearance in his lordship's eyes. In returning his route lay through Daventry, "a large dirty market town not famous for anything in particular," Towcester, Fenny Stratford, Dunstable to Gorhambury, where he arrived on September 23. The six weeks' tour strengthened his lordship's former opinion "that, though each county may boast of its own particular excellences, yet, considered in the whole, none can exceed the beauty or be preferred to that regular uniformity which is to be met with in every part of Hertfordshire."

It would be interesting to know whether after examining so many larger residences he was as contented with Gorhambury as with Hertfordshire. It was a new house, for on October 25, 1784, there is the following entry, "Took possession of our new house at Gorhambury on this day, after having been employed in building it seven years the second of last month." The bill of the architect has also survived, and the following is a copy of it:—

1775. September.—Account of Joseph Saunders, 252 Oxford Street, London:—

To making working drawings for a summer-house at Gorhambury, going down there and setting out ditto, &c.	£10 10 0
To surveying the house, giving instructions for shering (<i>sic</i>) it, taking the plans of it, &c.	15 15 0
To making designs for a new house at Gorhambury, making four drawings of ditto, &c.	52 10 0
	£78 15 0

The account relates to preliminary work. Whether Joseph Saunders was allowed to superintend the work and was paid further sums is not known.

In the following year Lord Verulam on August 8 started on another journey. From Oxhey, near Bushey, he went to Moor Park, which formerly belonged to the Duke of Monmouth, and was then considered as the best piece of brickwork in England, with a very excellent garden annexed to it. It was afterwards settled on the Duchess of Monmouth, who sold it to Benjamin Heskins Stiles, 1720, who improved it by building a south front of Portland stone with colonnades; the north front, in row, equal to the south. "The inside of the house has been much ornamented with painting and modern furniture by Sir Lawrence Dundas, who purchased it of Lord Anson, whose father bought it of Mr. Stiles." Geology was in 1769 in its infancy, and it is recorded that from a hill near this place many shells of sea fish have been dug at different times. The next house which was visited was Bulstrode, near Gerard's Cross, a jointure house of the Dowager Duchess of Portland, and which contained some good paintings. Thence he proceeded to West Wycombe House, the seat of Lord Desperer. The front was described as of the Corinthian order and elegant; the back front is a cloister, supported above by Corinthian, below by Tuscan pillars. There were many valuable pictures in the salon. On the second day he reached Stowe, of which the following notes were taken:—

"Mr. Pope gives his opinion of this place very justly in two lines, viz. :—

Here order in variety you see,
Where all things differ, yet where all agree.

If a y house can claim the epithet of magnificent, it must be this; if any garden that of beautiful, it must be this at

Stowe. Nature has given sufficient water, which has been improved and properly formed by art. The entrance into these Elysian fields is so ornamented by a view of the house at a distance and beauties of the garden on each side that it must immediately captivate the mind of the beholder. The walk round is computed to be five miles, but the variety of pleasing objects, particularly of temples, obelisks, pavilions, &c., &c., takes off the tedium so much that it appears to be much less. These buildings, which are mostly dedicated to the heathen gods, or to some of his departed friends, have each of them their inscription, which shows in their application the good taste of the person who chose them. The mansion is a square stone building, which has since been enlarged by two wings in which are the most superb apartments. The approach is by a noble flight of steps ornamented with stone balustrades. A mean and incomplete description of this place would be unworthy of it; a proper one is out of my power to give. I therefore must refer my reader to a small book we purchased at Buckingham which will give an adequate idea of the unparalleled chain of natural and artificial beauties of this place."

From the last sentence we may suppose that the traveller's diary was, like other literary productions in those days, allowed circulation among his friends.

Oxford came next. It was entered by Balliol College, and the traveller therefore did not at first receive that noble impression which a sudden view of the High Street generally gives to strangers. He described the principal colleges and other buildings. In conclusion, he says "this University is governed very much in the same manner and by the same rules that Cambridge is. The genius of the two Universities is much the same, except that Oxford prides itself rather more in its independency and glory in not giving way to a compliancy with the measures of a court." Blenheim was next reached, but the crowds of visitors made a minute description an impossibility. The opinion was expressed that the architect, Sir J. Vanbrugh, finished it in as high a manner as his genius could point out. The tapestry, which represents the old Duke's victories, is the finest in England, perhaps in the world. The pictures, which have been culled from the choicest of the best masters, are inimitable, and would entertain, if not improve, every spectator that had sufficient time allotted. But this building, erected by the munificence of the public, is to be run over in the space of an hour, which rather tantalises than satisfies the curious eye. Lord Bathurst's house at Cirencester Park is said to have great beauty on account of its regularity, and indeed on account of the embellishments and size may justly claim to be styled magnificent. The hall is well proportioned, and ornamented with paintings of horses by Wootton and a very beautiful antique Roman coffer, with other sculptures. The Corinthian pillars add much to its elegance. There are many convenient and elegant apartments which are ornamented with excellent pictures.

The two Woods had almost recreated Bath in a style which was most pleasing to eighteenth-century amateurs. According to Lord Verulam, "the Circus, which may be called a model of the famous Circus in Rome, is a most elegant and noble building; the Corinthian, Ionic and Doric orders have a good effect, but the regular symmetry of the whole is the principal foundation of its beauty. Queen Square, Milsom Street, the two Parades are justly admired. The great success that has attended the Circus has inspired a number of people so much with the spirit of building that a select body of them have engaged in erecting another range of houses beyond the Circus, which from the form of it is to be called the Crescent. This, if it is completed, will in beauty or elegance vie with any other building in this place or indeed elsewhere." Bristol, on the contrary, did not find approval. It was said to be very disagreeable, the streets particularly narrow and dirty, and the noise of the trucks, which were without wheels, was annoying.

The Wye was found to be romantic beyond description. Tintern Abbey was wonderfully beautiful, and time seemed to have made little alteration on it since it was first destroyed. Monmouth and Raglan Castle were also visited. At Pontypool there was an iron manufactory and also one for japanning. It is stated that the Pontypool arch, which has a span of 140 feet, was erected by Edwards at a cost of only 500*l*. Wales could not offer to the traveller as many examples of the new style of mansion as were to be seen in the district visited in England. But the scenery offered compensation. They found their way to St. Davids, and the account of the appearance of the cathedral on September 10 will have interest for our readers:—

"The palace and cathedral are now mere ruins, but still have the remains of ancient grandeur. Part of the palace was erected by Saint Patrick (*sic*) for the reception of King John in his journey into Ireland; a monument to this saint is still showed here. This place was once an archbishopric, but has been since translated in [to] the bishop's palace. They show a kitchen which, by the number of fires, seems calculated to supply all the luxuries of eating. A statue of King John and Queen Mary is yet seen over one of the portals belonging to the palace. The cathedral is a most noble and sacred pile of building, though it must now boast more of its antiquity than beauty; it is 300 feet in length. The choir part is the exact size of the tower. The bishop's throne is particularly neat and beautiful; the mosaic pavement round the altar-piece is worth observation. St. David's shrine is to be noticed. Bishop Vaughan's Chapel is immediately behind the altar and is remarkable for the beauty of its architecture. The roof yet remains unhurt by time. This is the place in which it is said the penitents confessed their sins. St. Mary's Chapel, greatly esteemed by our famous antiquarian, Brown Willis, is immediately beyond the other; a relic of St. Peter's head is here presented (*sic*) as are also some other monuments of the bishops of St. Davids. In the church is the tomb of Edmund, Earl of Richmond, father to Henry VII., and also of the famous Owen Tudor. St. David was said to be the father of King Arthur, and lived to be 146 years of age; he was bishop of this place sixty-five years."

The errors in the history of the place suggest the remoteness of St. Davids and the indifference of Englishmen in general to the buildings. Lord Verulam was also too confiding to believe that Inigo Jones was once called Unner ap Jones and "was introduced into the world by Sir Robert Wynne of Llanrwst."

After a month among Welsh mountains it must have been a relief to the amateur when he entered Cheshire and saw the noble prospect which gave an idea of the fertility and richness of the soil of England. In describing Chester he says that "the rows or piazzas, first formed in that manner the better to oppose any enemy that entered the town, run along the side of the streets before all the houses, and have a very particular appearance; the upper storey of each building projects into the street, which makes this covered way. The great use of it now is to keep those that walk free from the rain. The shops are all held under these covered ways and do not appear to the open street. Chester is a very large and opulent town, beautified with many good buildings." Eaton in 1769 was only a small house within a good park.

On the road to Liverpool it was observed that in the neighbourhood of Prescot many of the merchants of Liverpool thought it a pretty spot for their summer habitations, and decked them out in all the little gaiety of a Chelsea villa. In Liverpool the traveller had to submit to a common experience, for it rained almost incessantly while he was sightseeing. He admired the Exchange, the new church of St. Paul, which cost 14,000*l.*, the docks, &c. But the streets were narrow and the houses, built of brick, were more calculated for convenience than for magnificence. He believed Liverpool vied with London in riches and opulence. The merchants appeared as if they intended to engross the business of the kingdom.

Knowsley is said to consist of a long front with nineteen windows. The collection of paintings was much injured by want of care. Crewe Hall, belonging to Mr. Crewe, was found to be a square of very old date which in its day was very superb. It was more to be admired for its antiquity than elegance or convenience. In the drawing-room, which was modernised and hung with paper, were some good paintings.

Trentham and Ingestre were among the mansions seen. Birmingham was admired for the improvements carried out about that period. From the town the traveller made excursions to Hagley and Warwick. He arrived at Gorbunbury on October 28 after an absence of eleven weeks and three days.

SURREY ARCHÆOLOGICAL SOCIETY.

THE annual outing of the members of the Surrey Archæological Society commenced at Lgham Park, permission to inspect which had been granted by Mr. C. S. Stevens, where Mr. H. E. Malden briefly described the earthworks and ditches, which, though possibly prehistoric

fortifications, were in extremely good preservation, owing to their having been strengthened and improved in the thirteenth century. The residence, which is of seventeenth-century date, was then visited, the chief features noted being its fine mantelpieces and carving.

Half an hour's drive, says the *Surrey Advertiser*, brought the party to Crowhurst Church. A paper was read by Mr. P. M. Johnston, who first drew attention to a large and ancient yew in the churchyard reputed to be at least 1,500 years old, and probably therefore marking the site of a pre-Christian meeting-place and cemetery. The church consists of a nave and chancel and a small south aisle, the only entrance being through a porch on the south side. The nave is only 33 feet 6 inches by 17 feet 9 inches, the chancel 21 feet 3 inches by 13 feet 9 inches, and the aisle 17 feet 3 inches by 8 feet 9 inches. The present nave and chancel may represent the shell of a stone-built Norman church, but there are no features visible of earlier date than the last decade of the twelfth century, to which period the aisle, with its entrance doorway and door, belong. The font, which is of beautiful design, is probably of the early thirteenth century, and the church contains some remarkable monuments, chiefly representing members of the Gaynesford family, Mr. Johnston stating that there was no more interesting tomb carving in Surrey.

Before leaving this district a visit was paid to Crowhurst Place, a timber house which dates from the fifteenth century, and is surrounded by a moat which comes quite up to the kitchens. Mr. Ralph Nevill, who described the house, said he considered this was the best specimen of Domestic architecture in Surrey. It belonged to the Gaynesford family—a family of considerable importance from 1340 to about 1700—and the hall and other parts date from the early part of the fifteenth century. Sir John Gaynesford, who had married into the Poyle family, became possessed of the Poyle estates at Guildford, and was buried there. The Sir John Gaynesford who held the property in the time of Henry VIII. seems to have wished to emulate his royal master, who is said to have stayed here sometimes on his road to Anne Boleyn at Hever Castle, since he achieved six wives, and that without the help of the headsman. He had twenty children, but Crowhurst Place eventually came to Erasmus, a son of the sixth wife. The daughters married into good families, and no doubt carried with them portions of the extensive estates. There are several coats of arms in the windows, showing the alliances with De la Poyle, Wakehurst, Covert and others. The house possesses a remarkably fine hammer-beam roof of the early fifteenth century, and had originally a louvre in the centre, by which means the smoke made its way out, the hall being then open to the roof.

Lingfield was the next point. A visit was paid to the fine old parish church, the architecture of which was described by Mr. John Oldrid Scott, who stated that the tower and western portion of the church were of the fourteenth century and the rest of the building fifteenth century. The church contains a splendid series of monuments and brasses, many in memory of the Cobham family, and a description of these was read by Mr. R. Garraway Rice. An opportunity was afforded of inspecting the guest hall, close to the church, by kind permission of Mrs. C. Forster Hayward, whose family will be remembered by many of our readers as former residents of Godalming and who have done much good work in restoring this interesting building. The guest hall was built in 1431 by the third Lord Cobham and much of the original work remains. The banqueting-hall, with its gallery, was inspected with great interest, and was aptly described by more than one of the ladies as a "gem."

Permission to inspect Blockfield, a moated house of the fifteenth century, having been granted by Mr. H. Jeddere Fisher, Mr. Philip M. Johnston spoke of it as one of the most remote houses in the most remote corner of Surrey, and said that, from its style, its date was probably between 1480 and 1500. Only a brief stay here was possible, and the party were then smartly driven to New Place, Lingfield. The inspection of this interesting seventeenth-century house had to be reluctantly abandoned.

The Education Committee having been informed that at the present time there are slight differences in the fees charged at the several schools of art controlled by the London County Council, a uniform scale has been drawn up and will come into force at the opening of the new session.

NOTES AND COMMENTS.

THE site of the Royal Infirmary in Manchester becomes by purchase the property of the Corporation. The sum expended will be 400,000*l.*, which is to be paid in four instalments. The Infirmary authorities have been urged to expedite the completion of a sufficient portion of the new Infirmary to accommodate 300 patients, in order that the ground might be made over to the Corporation at the earliest possible date. It is not, however, likely that the ground will be available until the end of 1908. A part of the site will enable the Corporation to carry out street improvements in the neighbourhood. Another part will be used for the erection of a new reference library, for the building in King Street used for that purpose has been sold for 161,465*l.* It is considered desirable that a new art gallery and a museum should also be erected. The special committee therefore recommend that the Council should, in a more definite form than has as yet been done, allocate the Infirmary site to the public free libraries committee and the art gallery committee, subject to the completion of the necessary street improvements, and to sanction the preparation, under the direction of the special committee, of plans to be hereafter submitted to the Council.

It is generally believed that PETER PAUL RUBENS was born in Antwerp in 1577. There is an inscription to that effect on the house he had erected and in which he died. But one of the Antwerp advocates has made a discovery from which it would appear that RUBENS was born in Cologne and passed nine years of his childhood in that city. The document in question is a genealogical tree of the artist's family going back to 1528. RUBENS has occupied so remarkable a position among artists, for he was an historical character as well as a painter, his biography has been often investigated. RUBENS himself wrote, "I have a great affection for the city of Cologne, where I was brought up until I was ten years of age." According to SMITH's catalogue, a stone tablet was inserted in the front wall of a house in the Rue de l'Etoile, on which was inscribed that PETER PAUL RUBENS was born there on June 29, 1577, and that JOHN RUBENS, his father, died there in 1587. JOHN RUBENS was a lawyer, and he fled to Cologne in 1568 on account of the religious wars in the Netherlands. It is believed he was imprisoned, but in 1578 he was living in Cologne. It is, of course, an honour for any city to be able to claim a great artist like RUBENS as a native.

"QUAINT and Historic York" is the title of a series of twelve plates reproduced from drawings by Mr. E. RIDSDALE TATE, with notes by Mr. GEORGE BENSON (London: B. T. BATSFORD). York presents an immense number of subjects which must always give pleasure to archaeologists, and some of the most characteristic are shown by Mr. TATE. The lantern of All Saints Church is believed to have been the original of St. Dunstan's in Fleet Street, London. Stonegate is a street which rivals any in Canterbury. Monk Bar, Bootham Bar, Micklegate Bar and Walmgate Bar are not surpassed by any portals in England. As Mr. BENSON says:—"The walls at York are unique, being embattled and surrounded by a ditch or moat, so that little imagination is required to recall the ditches filled with water and archers in basinet and with bows in hand pacing the ramparts." Photography has made York as well as other towns familiar, but neither large nor small plates can supersede such drawings as those of Mr. TATE, with their thorough attention to detail.

THE memorial to the late PUVIS DE CHAVANNES, the wall-painter, which M. RODIN has in hand, will not follow conventional lines. M. BONNAT executed a portrait of the artist (in return for a painting which we were allowed to reproduce), and it suggests that PUVIS DE CHAVANNES's figure was well adapted to be a subject for a statue. It is now supposed, however, that Paris

possesses too many figures in modern costume, and that there should be some limit to the representation of sartorial work. M. RODIN therefore proposes to show the bust of the wall-painter as placed on a stele. By the side of it will be a laurel tree, from which a youth typifying Painting is removing a branch in order to place it before the bust as a token of homage. There is originality in the idea, for although palms and laurels are among the properties of French sculptors, there is no precedent for the introduction of a tree.

THE session of the Architectural Association will formally commence on October 5, when at the annual general meeting Mr. R. S. BALFOUR will deliver his presidential address and the prizes will be delivered. Papers on the following subjects will be read at the fortnightly meetings:—"The Architecture of the Roman Empire" (illustrated by lantern views), by Mr. ALAN POTTER; "Axiality in Architectural Composition," by Mr. H. STANNUS; "The Difficulties which Beset an Architect in London, with special regard to existing legislation," by Mr. W. WOODWARD; "Architecture of Sicily" (illustrated by lantern views), by Mr. W. HOWARD SETH-SMITH; "Regent Street," by Mr. M. E. MACARTNEY; "Training and Workmanship," by Mr. G. C. HORSLEY; "Spanish Architecture" (illustrated by lantern views), by Mr. A. N. PRENTICE; "Sanatoria," by Mr. EDWIN T. HALL; "Westminster Cathedral," by Mr. J. A. MARSHALL; "Theatres," by Mr. FRANK T. VERITY. A paper will also be read by Mr. TEMPLE MOORE.

THE syllabus of the classes of the Borough Polytechnic Institute is satisfactory for several reasons. It is evidence that education of a general as well as a special kind is obtainable at cheap rates in districts which for a long time were supposed to be outside the pale of all but a humble class of teaching. Excellent premises have been erected, there is a large staff of teachers, and the subjects are those which are essential to everyday life. The Institute can claim to be a *studium generale*, but with an amplitude beyond the imagination of the Mediævalists who first used the phrase.

A POINT of some importance has been decided by RIDLEY and DARLING, J.J., upon the construction of section 91, subsection 1, of the London Building Act, 1894. It is provided by the subsection in question that where a difference arises between a building owner and an adjoining owner in respect of any matter arising with reference to any work to which any notice given under this part of the Act relates, the matter shall be submitted to the arbitration of surveyors, and that "they shall settle any matter from time to time during the continuance of any work to which the notice relates, in disputes between the building owner and the adjoining owner, with power to determine the right to do and the time and manner of doing any work, and generally any other matter arising out of or incidental to such differences." The question arose, in the case of ADAMS v. Mayor, &c., of St. Marylebone, whether this section gave the surveyor power to award consequential damages to an adjoining owner on account of loss of trade during the continuance of operations of the building owner. The Court decided that the surveyors appointed under this section could only consider questions of structural damage. It was pointed out that provisions for getting compensation for such consequential damage as was here sought to be recovered were contained in other sections of the Act. This section dealt only with differences of opinion as to structural questions.

ST. DAVIDS CATHEDRAL.*

(Continued from page 151.)

THE historian of St. Davids is fortunate in the commencement of the portion of his work which relates to its architectural history in not having, as in so many instances, to combat any received opinion attributing an exaggerated antiquity to the building. Even Celtic nationality has shrunk from attributing so vast and magnificent a fabric to the early native princes and bishops, and it would require no great amount of acumen to show the impropriety of applying the term "Saxon" to the buildings of a country which was never subjected to the internal sway of the Saxon kings. At all events, antiquaries from the days of Godwin downwards have been content to attribute the earliest portions of the existing fabric to the time of Bishop Peter de Leia, who was consecrated in 1176, and who is recorded to have rebuilt his cathedral after it had "bene often destroyed in former times by Danes and other pyrats, and in his time was almost quite ruined." There is, of course, no probability of any remains existing of the probably small and rude British structure which may have preceded the Norman invasion, but it does not at first sight agree with the ascertained history of other cathedrals to find not only no certain traces at present, but no distinct record preserved of the erection of any structure between the consecration of the first Norman bishop in 1115 and the re-edification under Peter de Leia, to which we undoubtedly owe a very large portion of the present church. It is, however, necessary at this stage of the argument to draw attention to a statement on which it is only wonderful that more theories have not been built up as to the existence of a Norman structure prior to the present one. In the "Annales Menevenses," which are for a long space of time our principal and, indeed, most invaluable guide to the architectural history, we find a "dedication of the church of St. David" recorded as having been celebrated in the year 1131, during the episcopate of Bernard, the first Norman prelate. But as the architectural world has been informed by Professor Willis in his lecture at Wells, such a "dedicatio" does not necessarily imply any building or rebuilding immediately precedent, and in this case we have a ready explanation in the formal canonisation of St. David at this time by Pope Calixtus II., which would naturally be celebrated by some such ceremony in his own church. Besides, this sort of implication is hardly the way in which so important a work as the reconstruction of the cathedral would have been recorded in a document which, with all its brevity, generally enters far more into particulars.

Even if it should be contended that a church was erected here between 1115 and 1180, the fact is of comparatively little consequence, as the reconstruction of the building, which commenced in the latter year, is undoubted, and no traces remain in the present church which there is any inducement to refer to an earlier period. The work of this date we may safely infer from the "Annales," as well as from the evidence of the building itself, involved a complete destruction of whatever was then standing whether of British or Norman origin. It certainly had no such influence on the present cathedral as the small building erected by Urban has so conspicuously had upon the existing church of Llandaff. But on the whole the amount of evidence both intrinsic and extrinsic seems in favour of the belief that no such intervening structure ever existed, and that the large and splendid edifice of which the nave still remains was the immediate successor of the small and dilapidated cathedral of the native saints and primates.

And we may indeed imagine that there were many circumstances about the see of St. Davids which may well have damped even the proverbial church building ardour of a Norman prelate. The utterly unsettled state of the half-conquered country would throw many obstacles in the way of great architectural undertakings, and the church of St. Davids after its frequent destructions may well have laid desolate for a while, just as that of Bangor did from similar causes in a much later and more civilised age. Besides, the character of Bishop Bernard as transmitted to us by Giraldus seems rather against the supposition that he at least would be disposed to rival the great works of the day in England, or even those of his contemporary

Urban at Llandaff. When we remember the stately pile which owes its origin to the labours of Ralph Flambard, one would not regard ordinary moral obliquity as supplying any *a priori* difficulty; but alienation of the revenues of his see and a restless hankering after some higher preferment are certainly not the qualities which one would expect to result in the foundation of a cathedral church.

The church of De Leia appears to have exactly answered to the present main fabric of the cathedral—the nave, choir and transepts, with their aisles, but exclusive of the subordinate chapels. Of these the nave and the western arch of the lantern still exist, and the remainder appears to have been rebuilt on his plan and to a great extent in imitation of his structure. Godwin, therefore, is fairly justified in saying that he "may in some sort be said to have built the church which now standeth." The extent of his church eastward appears to be shown by a small fragment, the only one east of the western arch of the lantern which can be assigned to this date, but this is one of no small importance. The east walls of the choir aisles, between them and the chapel aisles, though much altered by successive insertions, yet appear in the most essential parts of their masonry to be contemporary with the nave. Yet this part of the church is full of difficulties on any supposition. The wall exhibits below the present roof-line the earlier one, which, as we shall presently see, it retained till the fourteenth century, resting against the same point on the choir walls, but of much steeper slope, and consequently involving much lower walls in the aisles. Below this is a round arch looking just like one of those traced out for vaulting, and below it the arch of a round-headed window, blocked and cut through by the arch leading into the chapel aisle. If this be a vaulting arch there would be *prima-facie* evidence in favour of the belief that it must belong to a structure anterior to the present choir, afforded by the fact that the arches of the latter rise far above it, and consequently no roof of which it formed a part could possibly have co-existed with them. But, on the other hand, we shall find the same difficulty occurring where the two discordant elements are clearly contemporary, and there is even reason to believe that in some parts of the church the intention of vaulting was given up by reason of the impossibility of carrying out the contemplated design. Yet there is good reason to believe that we here have a relic of the earlier choir contemporary with the nave. For this arch, unlike the other arches of only contemplated vaulting throughout the church, is not merely traced against the wall, but is a real moulded rib. And, moreover, it has evidently been tampered with during the transitional rebuilding; it has been patched with a moulding of somewhat different section and made to rest on a much later capital, one of the most advanced of the second date, having a round abacus. The first fact certainly seems to prove both propositions—that this arch belongs to Bishop de Leia's work, and that it was altered during the Transitional changes. One can only conceive it retained at that period in order to give greater effect to the window below.

This fragment then seems sufficient to prove that the extent of De Leia's choir was identical with that at present existing, and that the east end was flat. It also, as being a moulded rib, does not prove, but certainly tends to encourage the belief that the choir aisles of this period were actually vaulted. Whether this be so or not, Peter de Leia certainly set, both in the aisles of his nave and in the nave itself, an example which seems to have found many imitators among the subsequent benefactors of St. Davids, namely, that of tracing out lines of vaulting which from some cause or other they failed actually to accomplish. It is not improbable that in his case the failure was connected with an original miscalculation in the design. His vaulting shafts exist all down the aisles, and at the east end the arch springing from them is traced out; but it seems quite impossible that the system thus suggested could ever have been carried out, as the apex of the arch against the east wall falls very much lower than that of the pier arch, so that a vault of the strangest and most uncouth kind would have been the result. One can only suppose that in planning the nave the effect which the vast width of the pier arches would have upon the vaulting—which, as usual, was left for the last thing—was altogether forgotten.

Nor was the design for sexpartite vaulting, which was traced out over the nave itself, characterised by a greater degree of wisdom, as the apices of the lateral cells were made much lower than those of the transverse arches, as we see by the present ceiling, whose impost coincides with

* From the *History and Antiquities of St. Davids*. Architectural History of the Cathedral, by W. S. Jones, M.A., and E. A. Freeman, M.A.

the apices cutting off so much of the western arch of the lantern. Had such a vault ever been carried into execution the effect would have been extremely unsightly.

The evidence afforded by the appearances at the east end of the choir aisles, and, indeed, by the vaulting system generally, is sufficient to show that the original aisles had very much lower external walls than at present, and consequently very much steeper lean-to roofs. The original roof-line comes almost exactly to the same point as the capitals of the later vaulting shafts. Externally, on the north side, we may suppose that the wide lower portion of the pilasters represents their original supports, and that they were heightened as we now see them when the aisle walls were raised. The single one of the same width throughout is a no greater difficulty, whether we think it was originally narrower than the others or was altogether constructed at the later date. At the junction of the north aisle and north transept there is also a piece of projecting ashlar (looking at first sight almost like a flat respond with the spring of its arch), which agrees with the first height of the aisles and is probably a member of the same set of pilasters. At the north-west angle internally there is an appearance somewhat like a flat pilaster, most probably a small portion of De Leia's wall, left when the upper part was rebuilt of a smaller thickness in the fourteenth century; connected with this is some change or patching in the strings which it is not easy to account for, nor, indeed, to ascertain the date or character of one of the strings, so completely is it defaced. At the corresponding point on the south side is another pilaster ranging with the later vaulting shafts, and which doubtless was designed to act as one of them; yet it is probably a portion of De Leia's work connected with the staircase turret which then, as now, occupied the south-west corner of the nave. It rises higher than De Leia's vault, but not higher than his wall, and as the vault was never completed, shows no mark of any roof against it.

How long the work commenced in 1180 took before it was completed we have no means of ascertaining. There is, however, reason to believe that it was still in progress about the year 1190, as in a document executed shortly after the death of Henry II. a contribution to the works then going on in the cathedral was allowed as a substitute for going to the Crusade. Perhaps, indeed, as a portion of the church is spoken of as "new" in 1220, we may venture to infer that it had not been brought to perfection very long before that time. So great a work would doubtless be spread over a considerable space of time, and it may not even have been accomplished during the episcopate of De Leia; but that the whole nave at least was erected from the design commenced by him can admit of no doubt. The whole is clearly of a piece throughout, with the exception of the western pair of arches. These, it will be remembered, are pointed, and exhibit some differences in detail from the others. What is especially remarkable, the bases of their responds do not present at all the same confirmed Early English section as those of the piers; but there is no reason to believe these arches to be either earlier or later than the rest. The base employed is very common throughout the church, being the prevailing one in the vaulting shafts of the nave, and if miscalculation of the ground or any other cause, accidental or designed, required these arches to be narrower than the rest, the natural mode of preserving comparative uniformity would be to bring them to the same level as the others in point of height by the employment of the pointed arch. For it must be remembered that the pointed arch was freely used in contemporary buildings, and we have it even here both in the triforium and in the contemplated vaulting of the nave. Hence we are not driven to suppose, as we otherwise might easily have done, that this form of arch was introduced as a novelty into this part of the nave, which would naturally be the last portion of the church brought to perfection.

Of De Leia's west front we are left to patch up our account from the indications still remaining in the wall and from some old and not very accurate engravings. That the aisles had at their west ends round windows of some sort is clear, but there may be some question as to their date. It would seem, however, from Grose's engraving, copied by Mr. Manby, that the lower half of each was blocked and common Perpendicular or other tracery, perhaps contemporaneous with that in the north clerestory, thrust into the upper part. Taken together with the splay at present existing in the north aisle, this may afford evidence that the round windows are original. The angles of the aisles and of the nave itself had quadrangular turrets, the former

certainly and the latter in all probability terminating in pinnacles. The turrets of the aisles must have contained staircases lighted by loops or small windows towards the west; those of the nave were adorned with blank arcades in two tiers corresponding with those of the windows. The arches of the lower arcade were pointed; the upper ones are doubtful. There was a great doorway in the centre under a semicircular arch of several orders; how adorned there is no evidence to show. Above this there were, as we have said, two tiers of windows. The lower tier consisted of an arcade of three equal semicircular arches, probably resting on engaged shafts and pierced by long narrow windows which seem to have had round heads. Over this we have a composition of five unequal lancets. Finally, there is a single lancet set in the gable. We may perhaps conclude from the contemporary evidence of Archdeacon Yardley that this composition of lights, with the probable exception of the single lancet in the head, which must have been meant to air the roof, was under a single containing arch, and that may have been the present rear arch of Mr. Nash's window.

... The next important event recorded by our annalist is the fact that in the year 1248 the church was very much damaged by an earthquake. To this cause we can hardly fail to ascribe the insecure and bulging condition of so great a part of the church, especially of the north side of the nave. But it must also have made itself very severely felt in the eastern part of the building. Possibly the tower or part of it may have fallen on the roof of the choir, as it can hardly fail to be at this time that the clerestory of that portion was altered. The alterations in the side windows were made, even at so late a period, in strict imitation of the former work, but at the east end, where the architect was less fettered by precedent, he produced a design in the usual fashion of the age. Besides the traces still remaining there is documentary evidence to prove the existence of a round window in the gable. It would be very possible, though not absolutely necessary, to attribute also the Early English arcades in the lantern to this age, especially if we suppose a second fall of the tower.

The chapels east of the choir were originally commenced during the Early English period; but we have not such direct evidence as to the exact date of those portions which must be assigned to this age as we have for the earlier and the later portions of the cathedral. They seem to have been built to a certain extent from a uniform plan, and yet even in the Early English details themselves we see changes sufficient to induce us to suppose that the work was commenced at a much earlier period and spread over a long space of time with considerable intermissions. A great part was probably erected in connection with the repairs rendered necessary by the earthquake of 1248, although some portions seem earlier than that event. Notwithstanding numerous subsequent changes, enough is still preserved to show their general plan, though some parts remain in a state of no little obscurity. This general plan consisted then as now of a continuation of the choir aisles on each side of the central space, which is prolonged beyond them to form a lady chapel, but the latter in its present form was a somewhat later addition and apparently not contemplated in the original design of this period. Of the condition of the space immediately east of the choir now forming Bishop Vaughan's Chapel it is not easy to speak at this period. The description given of it in George Owen's MS. History, as "*vilissimus sive sordidissimus locus in tota ecclesia*," a designation which it is said to have continued to deserve up to the days of that prelate, is very remarkable and not very intelligible. But the idea conveyed by it, although sufficiently vague, agrees excellently with the manifest fact that, till that period, it clearly never entered so to speak into the design of the church; buildings were formed all round it, with no further reference to it than to exclude it from all account.

The Memorial to Dean Hole now being set up in Rochester Cathedral will be unveiled on the 29th inst. It consists of a recumbent figure of the late dean in statuary marble (exhibited at the last Royal Academy exhibition), the work of Mr. F. W. Pomeroy, A.R.A., which rests upon an altar tomb or base of alabaster designed by Mr. C. Hodgson Fowler, F.S.A., the cathedral architect. The memorial is at the southern extremity of the south transept, close to the lady chapel.

THE ARBOR LOW STONE CIRCLE.

SEVERAL of the members of the North Staffordshire Field Club, under the leadership of the Revds. C. F. L. Barnwell and F. C. R. Jourdain, lately visited the stone circle at Arbor Low, Hartington Church and Beresford Dale. At Arbor Low an inspection was made of the imposing and impressive monument.

It should be stated, says the *Staffordshire Advertiser*, that the whole of the stones forming the "circle"—it is not actually circular, but was described as pear-shaped—lie prostrate and partly sunk in the turf, and the question of whether they ever occupied any other position appears to be a debatable one. The circle is surrounded by a fosse, or ditch, with an outer vallum or rampart and a tumulus at the highest point. There are numerous barrows in the locality.

Mr. C. Lynam remarked that though he had visited the place many times he had never been there without finding at least a fresh breeze blowing. The early archæologists, the Batemans, did work there, and dug on the enclosure and the tumulus. They found some flints and two pieces of pottery. Recent explorers had found that they left Arbor Low in a very rough state and apparently cared little what became of it. The British Association had now taken up the study of this remarkable work, and for two successive years they had engaged Mr. St. George Gray, a gentleman who worked under General Pitt-Rivers for eleven years. Mr. Gray made a most accurate survey of every point within a certain square enclosure surrounding the work at Arbor Low, with the result that they now had a perfect map and sections of the place. Mr. Gray also made six excavations, some across the fosse and some across the vallum, and one or two by the side or in front of some of the stones. But he was not quite satisfied, and was asking that he might trench the whole of the interior. Whether that would be allowed him or not remained to be seen. Mr. Lynam exhibited Mr. Gray's map. The surface of the present fosse was by no means the surface of the original fosse, because it had had tens of centuries to silt up. The fosse was really cut into the limestone all the way round. He added that though the stones themselves were not in a circle, the vallum was a true circle on the top. Mr. Lynam refrained from any more detailed remarks at this point, as he feared the members would feel the cold wind, but later in the day he read a summary of the report of Mr. H. St. George Gray upon his investigations, explaining that Mr. Gray was employed by a special committee appointed by the British Association to investigate ancient British remains of this character, and which committee comprised Dr. Garson (chairman), Mr. H. Balfour (secretary), Sir John Evans, Mr. C. H. Read, Professor Meldola, Mr. A. J. Evans, Dr. Munro and Professor Boyd-Dawkins. During the six weeks that the excavations were in progress no metals were discovered nor any traces of fictile ware that could be assigned to the date of the construction of Arbor Low. Six excavations were cut through the fosse, two cuttings were made through the vallum, four patches of trenching were dug in the interior and in the small dyke to the south-west; 7 feet of rampart and 1½ feet of ditch were excavated. The number of relics found was certainly disappointing, and yet, on the other hand, Arbor Low not having been a habitation, and from negative evidence not appearing to have been a place of sepulture at a period closely following its construction, more relics could not perhaps be expected under the circumstances. Nothing Roman had been found except three small fragments of what appeared to be Romano-British pottery just below the turf in the interior. Dr. Cox wrote in 1884:—"I have been myself convinced after the closest and most unprejudiced study that the date of Arbor Low is subsequent to the Roman occupation of Britain, and that it was erected as a trophy of victory on a spot where a commander fell or where the crisis of a battle was decided." Flint scrapers were frequently found during successive ages down to and including Roman times, but here they were found deep in the silting of the fosse, only in association with other rude stone implements and chipped flint arrow-heads of Neolithic form, but of a variety found also in later periods. The majority of the implements found at Arbor Low appeared to be of chert, which was only what would be expected, seeing that it was indigenous and an excellent substitute for flint. Arbor Low was of such precise age as the barbed arrow-head might have assigned to it, having been found on the bottom of the deepest portion of the fosse. This form, being usually recognised as a late development in Neolithic flintworking, pointed to

the probability of the construction of the fosse and vallum not being assigned to a date earlier than the late Neolithic period, although, judging from various "finds" of Neolithic arrow-heads of barbed form, they might perhaps have been in use in some districts about the middle of the Neolithic period. However, there were no indications that this arrow-head might have reached its position at a date long subsequent to the formation of the fosse. On the other hand, it was well known that the tanged and barbed type of arrow-head was very frequently associated with Bronze age "finds." The existence of stone implements to the exclusion of bronze did not necessarily establish a Neolithic age for a monument such as this; yet considering the amount of excavation done the absence of bronze had some significance. If Arbor Low was actually constructed in the early Bronze age we should not expect to find any abundance of the then precious metal. On the south-west vallum a Bronze age tumulus was constructed, undoubtedly from material derived from the original monument of Arbor Low. No bronze was found here or in Gib Hill just over a thousand feet distant, but their other contents pointed to a Bronze age culture, probably not particularly late. If the "finds" from this tumulus on the vallum of Arbor Low were to be regarded as belonging to the early Bronze period, then "the probability of the circle being of the Neolithic date is much increased." Their conclusions, in the present state of their knowledge, had to be deduced on somewhat meagre evidence as regards the quantity and nature of the relics found. The date of the construction of the Arbor Low stone circle should be located in accordance with the evidence derived from these explorations, within the period covered by the late Neolithic and early Bronze periods—in other words, the period of transition from stone to bronze. The date of the construction of Arbor Low appeared to tally precisely with Mr. Rowland's deductions as to the date of the erection of Stonehenge, from evidence derived from his excavations there in 1901. The Bronze age, according to most authorities, commenced in Britain *circa* B.C. 1800, so Arbor Low might be reckoned at from B.C. 1900 to B.C. 1600. With reference to the skeleton found in the centre of the circle, Mr. Lynam quoted the following observations by Dr. Garson:—"The skeleton is that of an adult male. The osteological characters show that the individual was not of the type found in interments of the Neolithic period, neither do they point to his being of the Bronze age type, though he was more nearly allied to it than to the former. On the other hand, there are no characters about the specimen which would preclude its being much more recent, even that of a person interred only about 100 years ago. The extended position in which the body had been laid decidedly supports the view of the interment being of more recent date than the Roman period, to which I consider the weight of the evidence afforded by the osteological character also points."

The Rev. F. C. R. Jourdain spoke of the great advance made in regard to this subject in the last thirty years. Sir John Lubbock read a paper to the British Association on that spot in 1879, and admitted that he did not know the object of the monument, and Mr. Cunningham, opening a Wiltshire barrow, said, "I don't know—nobody knows, and nobody will know." To-day, however, he thought they could begin to see daylight. They no longer regarded the interment which had taken place there as the *raison d'être*. There were formerly two parties holding different views of these stone circles. One party thought they were burial-places, and the other temples. Sir John Lubbock tried to show that it was a natural transition from a dwelling-house to a burial-place, and from a burial-place to a temple. About 1891 Sir Norman Lockyer went to Egypt and proved that the temples were carefully oriented, so that the rising and setting of certain stars and that of the sun at certain seasons could be watched along the axis of the temple by a priest. This was independently suggested by Nissen, of Bonn, and references also occurred in inscriptions. If, as seemed probable, Sir N. Lockyer's researches were on the right line, the objects for which it was done were three, viz.:—(1) To determine the time at night; (2) to observe a star rising or setting heliacally, *i.e.* about an hour before sunrise, on great festivals, so that when it was necessary to do anything at sunrise they could be prepared; (3) to determine the time of year, when the sun had reached a particular point. Thus they could tell the exact day of any particular year when a great festival was due. In the earliest time the year began with May, but it was afterwards altered to the solstitial year, beginning on the longest day, June 21. In regard to the Egyptian temples, they had

very dubious information as to when the buildings were erected; but where it was known, the date coincided in a wonderful way with the results obtained theoretically. As instances, he gave a temple which was, as far as they could tell, founded 6,300 years ago and restored 5,100 years ago, and the theory gave the respective dates as 6,800 and 5,000 years ago, and a second case in which the date was fairly accurately known as 4,333 years ago, and the theory gave 4,400. The same theory was tried in Greece by Penrose with excellent results, because the dates of buildings were more exactly known from other sources. The third stage was the application of the theory to our stone circles in England. It was difficult to say at once what the axis was, but if they took a line from the centre of the circle to one of the outlying barrows they did get an axis, and if they did the same in respect of several barrows they got several axes. By calculation they could find out what stars were rising and setting along these axes. In explaining the theory, Mr. Jourdain said if they first measured off the exact angles of the outlying stones from the centre, then measured the angular height of the sky-line across this line with a theodolite, with these two and the latitude they could calculate the declination — *i.e.* the distance from the equator of the body observed along that line. This declination was always changing. By tables which went back 6,000 years it was possible thus to ascertain the age of the circle. The principle had been applied to about eight British circles (but not yet to Arbor Low), and, roughly, the dates ranged from B.C. 1000 to B.C. 2300. As happened in Egypt, they began as May temples and ended as June ones. He did not mean that they could get an exact date for each circle. They could take one line of observation and find out when it was laid out, and then take another and find out when it was laid out, some hundreds of years later, just as they could go into a church and pick out the different periods of architecture. According to the number of axes they got a number of dates, and they might infer that these circles were laid down very carefully, very gradually and very slowly. This was an enormous step in advance of 1879, and he thought it was a reasonable theory to account for these circles. The quantity of actual remains found at Arbor Low was small. If they imagined that it was used as a kind of observatory the whole thing was perfectly clear. No doubt the astronomers dwelt there. The results of recent research showed that there was a distinct connection between Egyptian temples and these circles. Probably the priests who worked in those stone circles in England received their first training in the same school as the Egyptian and Grecian priests did. One reflection that these things suggested was the enormous amount of care used in the selection of these places and the skill with which the outlying angles were laid out. It was all very wonderful, considering the paucity of scientific instruments and aids then possessed by the people. A vast amount of astronomical research and preparation must have taken place. He reflected that the outstanding stones must have been illuminated at night. Cæsar said, "The Druidical priests were in the habit, not only of carrying on investigations of their own, but also of handing it on to their youth." These investigations only tended to show how true his words were. One could not study these things without an increased respect for the abilities and patience and attainments of our fathers.

Mr. T. Arthur Matthews, of Ashbourn, an engineer who has given much care to the study of the Arbor Low circle, was present, and laid before the Club some remarkable facts which his researches had brought to his knowledge within the last few months. Mr. Matthews said he met Mr. St. George Gray there during that gentleman's examination, but the information he was able now to communicate had been gathered since that time. He explained that he was intensely interested in the subject and pursued it as a hobby. Mr. Matthews went into considerable detail of a technical character, but the facts which he stated and upon which he based his theories, included the statement that Arbor Low was almost exactly due north of Stonehenge, and even more exactly 2 degrees of latitude north of Stonehenge. The site of the circle rose considerably to the north, and one of the outer stones was due north from the centre. His observations led him to attach great importance to the angle of 30 degrees west of north — which was as XI. on a clock face, if XII. were due north — and also that of 30 degrees east of north. He pointed out a semicircular dip in the line of hills which gave a view of more distant peaks, and said the line 30 degrees west of

north crossed that indentation, whilst if the line were continued over 100 miles it crossed the stone circle of Lang Meg, Cumberland. In both directions from Arbor Low along this line there were also long lines of barrows situated at intervals. A similar line drawn from Stonehenge took them to the great Druidical district of Anglesey. He made no comment upon these facts, but simply stated them as such. He also noticed that one of the stones was pierced with a hole, and he had ascertained by measurement that if that stone were standing, as he believed it once was, that hole came directly in the line of 30 degrees east of north. Mr. Matthews produced a drawing to scale of the central stone, and asked if any of the company saw a likeness in the shape to any particular object. A member of the party at once suggested the sacred bird of Egypt. Mr. Matthews was glad someone else had seen the resemblance. It resembled exactly the Egyptian Hawkhead god. Mr. Jourdain had ascertained that the Hawkhead god was Ra, the Sun god. Mr. Matthews added that he thought there was no doubt also that the indentations forming the beak were artificially worked.

Mr. Lynam remarked that it had hitherto been agreed that no tool had been used on any one of the stones, and after an examination of the stone he thought there was nothing to prove that it had been artificially shaped. Mr. Matthews, however, entertained that view. Mr. Lynam added that Mr. St. George Gray would be extremely glad of the information Mr. Matthews had communicated.

Mr. Matthews added that he thought the selection of that site was a matter of constant observation for probably one hundred years.

"SPECIFIC PERFORMANCE."

A REMARKABLE judgment was recently given in the Appellate Division of the Supreme Court, New York, which suggests the difficulties of architects in dealing with the subdivisions of American municipalities. Messrs. Horgan & Slattery, architects, were directed by the Armoury Board of New York to prepare plans and specifications for an armoury building. They prepared preliminary plans and estimates, which were approved by the Board on January 23, 1901. Application was made to the Commissioners of the Sinking Fund for an appropriation of 500,000 dols. to carry out the work. On March 8 they authorised the Armoury Board to take such steps as were necessary to enter into the contract, and the sum applied for was appropriated. On April 3 a resolution was passed by the Board directing Messrs. Horgan & Slattery to prepare "detailed plans and specifications in accordance with the plan which has been adopted by the Armoury Board and approved by the Commissioners of the Sinking Fund for an armoury building for the 69th Regiment," and directed that they be submitted for approval to a committee of that Board appointed therefor.

The plans were duly prepared, and on November 19 a formal contract was entered into for their preparation at the usual commission.

When tenders were received they were found to range from 666,394 dols. to 744,394 dols., exclusive of architects' fees. The Armoury Board rejected the plans of Messrs. Horgan & Slattery and arranged for a competition. The architects sought to recover fees, and were awarded 2½ per cent. on 450,000 dols., with interest added and 5,000 dols. for damages. The City of New York appealed on the ground that the Armoury Board had no authority to enter into a contract, and that the work to be performed was not carried out. The Appellate Division in their judgment say:—

We think it must be held, under the doctrine of this court that the Armoury Board had no power to incur an indebtedness for architects' fees, which the city became liable to pay, until it had been authorised to incur such indebtedness by resolution of the Commissioners of the Sinking Fund. The resolution of those Commissioners, passed March 8, 1901, did give the Armoury Board authority to employ plaintiff, which authority they exercised by their resolution of April 3 following, directing plaintiff to prepare detailed plans and specifications for the erection of the proposed armoury. It is only for services performed by plaintiff after this time that the city is liable, if it is liable at all.

It was not necessary to let the contract for the preparation of plans and specifications for the proposed armoury by competitive bidding. The services required scientific

knowledge and skill, and that character of service need not be obtained by bids. Nor was it necessary that the Armoury Board enter into a written contract with the plaintiff for the performance of such services. That might be done by resolution and subsequent direction.

The plans and specifications were prepared after April 3, and before the written contract which was not a necessity. If the plaintiff substantially performed its contract, which we think was to furnish plans and specifications for an armoury which could be erected within the sum of 450,000 dols., then it is entitled to recover therefor the customary price, which was proven to be 2½ per cent. upon the cost of the building. This, however, the plaintiff did not do. The resolution of March 8, appropriating the money and giving authority to the Armoury Board to proceed and hire plaintiff, limited the cost of the building to 450,000 dols. Plaintiff says it did not know of this limitation until the written contract of November, after the plans and specifications had been furnished. The resolution was a matter of public record, and the plaintiff was dealing with a municipality and should have ascertained the limitation of cost. Besides, plaintiff's chief architect, prior to April 3, in discussing the preliminary plans with the chairman of the Armoury Board committee, to whom he announced that the proposed armoury could not be erected short of 600,000 dols., was told by such chairman that the Board never allow more than 500,000 dols. at the outside for its erection. This was actual notice of the limitation, which plaintiff's plans and specifications far exceeded. The bids for erection were the final test of the cost, and all of them exceeded the limitation by nearly 200,000 dols. If there was a limitation within which plaintiff must reasonably come, and within which it was bound to come, the excess cost was so great that it cannot be said that plaintiff substantially performed its contract.

An architect employed to furnish plans and specifications for the erection of a building is entitled to remuneration therefor, if they are made in accordance with the directions of the owner. He cannot recover, however, where the owner stipulates that the plans and specifications shall be for a building not to cost over a specified amount, if the plans and specifications made are for a building substantially exceeding that sum.

The plaintiff failed to bring itself within this proper and salutary rule, and therefore should not have been permitted to recover under its first cause of action.

There cannot be said to have been an acceptance of the plans and specifications by the Armoury Board, notwithstanding they did not meet the restriction as to cost of erection.

That fact could not be determined until the bids were received and it was thus found what the cost would be, and it is quite doubtful if the Armoury Board would have the power to bind the city by the acceptance of plans not in conformity with the contract, and the cost stipulated by the Commissioners appropriating the money. If any other reason were needed for the reversal of the judgment it is found in the charge of the court, which was a substantial direction of a verdict for the 2½ per cent., the defendant being permitted to except to whatever the court said on that subject.

As to the second cause of action, it is manifest that the plaintiff in no sense showed such a substantial performance of its contract as to entitle it to damages for breach of hiring. It furnished no plans and specifications from which an armoury costing within 450,000 dols. could be erected, nor did it conform to the plans already made to a building costing within that sum. The Armoury Board, therefore, on disclosure of the cost as shown by the bids had the right to reject the plans and to dispense with the plaintiff's services and terminate the contract. Here, too, the court erred in charging the jury that there was no ground for the discharge of the plaintiff, to which the defendant excepted.

The plaintiff complains that it was not asked to alter the plans so that the cost of erecting the building would come within the stipulated amount. It was for the plaintiff to perform its contract and to show that it has so done before it asks damages for breach by the other party.

It is quite evident that the plaintiff performed a large amount of work for which it would be just that it should receive some compensation, and we have endeavoured to find some ground upon which plaintiff could recover the fair value of the work and labour which it performed. The resolution of March 8 empowered the Armoury Board to employ an architect. By the resolution of April 3 that Board employed plaintiff. It was necessary for the Armoury Board to obtain accurate information with respect to the kind of armoury that should be erected. Preliminary

sketches might and might not be accurate with respect to disclosing the cost. Plaintiff did a large amount of work in elaborating the ideas of the Armoury Board with respect to the proposed armoury, and finally by its labours demonstrated that the building could not be erected within the sum provided. The necessity for a larger appropriation was finally recognised by the Commissioners of the Sinking Fund, and they increased it, and the armoury in the end was erected at about the cost called for by plaintiff's plans. The work performed by the plaintiff was of value to the Armoury Board, and thus to the city, in the final determination as to the style and character of the armoury. Equitably it would seem that the plaintiff can and should be permitted to recover the value of these services performed up to the time of receipt of the bids, not, however, upon any percentage as to cost of erection, but upon a *quantum meruit* for the actual value of the services in fact performed. It is probable that this sum ought to be limited to the usual charge for preliminary sketches, which would be only 1 per cent. We do not mean to hold that the plaintiff is entitled to absolutely recover the 2½ per cent. upon the cost of erection, or a sum equal to that amount; but if it can recover at all, it should be permitted to recover what it paid out to its clerks and assistants in preparing the plans and specifications, together with a reasonable compensation for the time spent by its chief architects and the advice which they gave to the Armoury Board.

TRANSVAAL COLLEGE COMPETITION.

THE Council of the Transvaal University College recently sought designs from South African architects for the proposed new buildings of the college.

The buildings were to cover the whole of Plein Square, although it is only intended at present to proceed with the erection of the eastern wing at an estimated cost of 80,000*l.* Twenty-eight architects competed, one sending two designs. The Council secured the services of Mr. T. E. Collcutt as assessor, and he visited South Africa for the purpose.

In his report dated August 6 Mr. Collcutt says:—

As the assessor appointed by your Council to examine and report on the relative merits of the designs submitted in competition for the building of the University College, I now beg to say I have made a careful and exhaustive examination of the several plans and elevations, the result being that I award the premiums in the following order:—

I award the first premium to design No. 1, the second to No. 14, the third to No. 23, to fourth to No. 28, the fifth to No. 19, and the sixth to No. 18.

I have examined the estimates submitted with the above designs, and I am of opinion that any one of them could be carried out for the sum of 80,000*l.* There are twenty-nine designs submitted in the competition by twenty-eight architects, one architect having sent in two designs. The total number of drawings illustrating the twenty-nine designs is 270.

Before making the above awards, I carefully studied the conditions issued by your Council, and also the series of questions asked by some of the competitors, and the replies thereto. These questions and answers, I am informed, were communicated to all the competing architects. After careful consideration of the several plans, I have arrived at the conclusion that very few, if any, of the competitors have succeeded in producing a satisfactory scheme dealing with accommodation under schedule A (which, it may be stated, relates to the wing that is to be first erected).

On the other hand, many of the competitors have dealt in a satisfactory manner with the building scheme for the whole site, but always excepting the block allocated to the accommodation in schedule A. I am of opinion that the area apportioned for schedule A is inadequate, and therefore it has been impossible to devise a really satisfactory plan.

From the above remarks it may be gathered that the premiated plans show many defects, but similar defects are to be found in all the other designs submitted.

It gives me pleasure to state that many of the designs, besides those selected, are of considerable architectural merit, and I venture to express the feeling that your Council, by adopting the first premiated design, have the opportunity of seeing a building erected which will be worthy of a great city.

The successful architects are:—1. R. Howden. 2. G. A. H. Dickson & McCowat. 3. Stucke & Bannister. 4. I. H.

Till & A. E. Till. 5. McIntosh & Moffatt. 6. Leck & Emley.

All the successful architects practise in Johannesburg.

Mr. Howden has practised in Johannesburg for eight or nine years, having come to the Rand from Australia. Amongst buildings which he has designed are St. George's Presbyterian church, Noord Street (which cost 20,000*l.*), Bree Street Congregational church, and residences for Messrs. Hoyle, Bleloch and Jas. Mackay.

CARNEGIE LIBRARIES.

A MEMORIAL from the architects of Dundee relating to the Carnegie branch libraries has been sent to the Town Council. They object for the following reasons to placing the work in the hands of the burgh engineer and city architect. Through Mr. Carnegie an opportunity has come to the city to erect important public buildings, and it is fitting, they say, that these should commemorate in a most worthy manner his generous gift. Your memorialists are not aware of any single instance in which a city official has been entrusted with the carrying out of such work, and public opinion and municipal authorities in other cities have been entirely against this procedure. Keeping in view the importance of careful and thoughtful planning in a library building, and recognising that it should be of a monumental character and give an artistic expression of its purpose, it is desirable to extend the area of thought brought to bear upon its design, so that the best results may be secured. The incentive of competition is without doubt the best method of securing this desirable end. Without reflecting on the burgh engineer's merits as an architect, they would point out that with so many official and administrative duties, along with the supervision of work of an intricate and practical nature, it is not possible for him to give the necessary amount of reflection and study which such buildings demand, and, if placed in his hands, he must necessarily delegate the greater part of the work to irresponsible assistants. Even in the interests of true economy they would point out that if the work of designing and carrying out these libraries is done by the burgh engineer, the attendant expenses would be actually borne by the ratepayers of the city instead of by the donor. In the full hope that these reasons will meet with the approval of the Town Council, the memorialists point out that to conduct this competition properly it is of first importance that a professional assessor should be nominated, who would draw up the necessary conditions in conjunction with the city officials, and would undertake the sole responsibility of selecting the best design, keeping in view the total sum to be expended in each case. The attention of the Council is drawn to the regulations for architectural competitions issued by the Royal Institute of British Architects, which will act as a guide in this matter. It was further intimated that a deputation would attend the Council meeting on Thursday and be heard in support of this memorial. The memorial is signed by Messrs. J. Donald Mills, Thos. M. Cappon, John T. Maclaren, George Alex. Pyott, Charles Mann, George A. Harris, P. H. Thoms, R. Blackadder, George Jamieson, Richard G. Murray, William Salmond, Charles G. Soutar, William Forrest, Edward Tough, Johnston & Baxter, James Findlay, Leslie Ower, James Lowe, James Foggie & Son, James P. Bruce, W. Clark, James Sibbald, Godfrey Shepherd, David L. Allan, R. Hunter, William Gauldie, R. Gibson.

THE ROMAN WALL EXPLORATIONS.

AT a meeting of the Newcastle Society of Antiquaries last week Mr. F. Haverfield, D.C.L. (vice-president), read a paper entitled "Notes on Mural Problems." In this he criticised severely the explorations of the Roman wall during the last half-century. For instance, he said, the mile castles had been generally accepted as belonging to the period of the fourth century, but, so far as he could ascertain, no pains had been taken to identify coins or pottery found near them with that period, and in that respect the exploration of the Roman wall had failed in a scientific sense. Half a century ago it was the finest example of its kind in existence, but that could be no longer said. In conclusion, he remarked that the Roman vallum still thwarted the efforts of archaeologists as to its specific reason, and they had never been able to find a satisfactory reason for retaining walls or artificial hills being erected, sometimes to the north and sometimes to the south of the wall.

RESTORATION OF CARNARVON CASTLE.

ONE of the architects of the Board of Works has been commissioned to pay a visit of inspection to Carnarvon Castle this week, for the purpose of preparing a report with a view to the continuance of the scheme of restoration which has been in progress for many years. This step is the result of correspondence which passed between Sir John Puleston, constable of the castle, and the Board of Works a few months ago. It is also known that the King is evincing personal interest in the project. His Majesty, while Prince of Wales, visited the castle in 1894, and the Queen on the same occasion ascended to the dingy chamber in the Eagle Tower, which is reputed to be the birthplace of the first Prince of Wales. The present well-preserved condition of the castle is a monument to the enterprise and industry of the late Sir Llewelyn Turner, who, during his long tenure of office as deputy constable, applied all the visitors' admission fees to the work of restoration. One tower was re-roofed and otherwise rendered habitable, enormous breaches were repaired in others, and a large number of fresh steps and newels were placed in other parts of the building. Latterly the present deputy constable (Mr. Charles A. Jones) took in hand the completion of the coping-stone along the imposing north front of the structure. It is generally expected that the Government may see its way to make a substantial grant at an early date to carry on the work, and in return it is probable that the fees collected for admission will henceforth have to be transferred to the Government.

WINCHESTER CATHEDRAL.

WINCHESTER CATHEDRAL is now almost entirely under architectural supervision as to its exterior, and the interior beyond the chancel is a mass of scaffolding, and judging by the gigantic struts or supports of timber shoring up the eastern chapels and the mass of materials lying all round the building, it is not too much to say, says the *Hampshire Chronicle*, that Messrs. Thompson's workmen have come to make a long sojourn in and around the vast historic structure. The original estimate of 30,000*l.* for repairs is, we fear, far too small. The state of the walls of the transept and De Lucy's aisles, the vaulting of the latter, the necessity of repairs at the west end and other matters, will absorb as much again or more.

Over eight centuries have passed away since Walkelin completed his immense cathedral church. His tower fell in 1107, when it was rebuilt, and rests on the most massive piers in England. Happily this fine example of Norman architecture stands firm and requires no attention—at least we believe so. The transepts are both shaky as to their northern and southern gable walls. The latter, even to the eye of the mere passer-by, is much out of the upright—as much, experts say, as from 3 feet to 5 feet. The former is being examined and tested by Messrs. Thompson's experts, who find the top of the walls defective, and there are evidences of bulging and overhanging. In order to test whether there is any "movement" in the masonry, strips of plaster of Paris are being placed on the weakest spots, which will be carefully watched to see if cracks appear. If so prompt attention must be given them.

The interior of the south transept has always shown evidences of settlements of very long standing, which do not appear in the other transept. In both the varied styles of the window arches indicate the different builders, Norman, Decorated, Perpendicular, so that the walls have often been tampered with. The trial hole in the north wall of the nave aisle has been carried down to the gravel, 18 feet altogether, including 12½-feet foundations, chalk under them, and peat, but the crack in the wall above ground here does not indicate any modern subsidence or danger of it. At the west end, where scaffolding is being erected, the chief work is to make good defects in stonework erected fifty years ago, which was not of a durable kind. A large projecting screen of boards has been erected to protect the entrances to the nave and aisles and the public.

Altogether the work necessary at the church is a very serious responsibility for the Dean and Chapter, and we hope that the Cathedral Fabric Fund will be equal to the emergency. The cathedral is a national historical monument, equal in its character to the metropolitical church of Canterbury or Westminster, and we feel sure that the devotion and veneration of our day will not fall short of that which animated our Catholic predecessors of all ranks and the great master builders of the past.

GERMAN CERAMIC INDUSTRIES.

AN interesting report on German ceramic industries has been prepared by Sir William Ward, consul-general. The German industry and trade in ceramic ware, including bricks, has largely increased during the last thirty years, and the indications point to further expansion. Common clays which can be utilised for brickmaking, and also those which can be used for the manufacture of common earthenware goods, are of frequent occurrence in almost every part of Germany. The rather superior kinds, and those which turn white after burning, are also common, but highly refractory clays are of rare occurrence. There are no very recent statistics available for obtaining a correct idea of the annual extent of the production of the various branches of German ceramic industry. The latest statistical returns are those furnished about five years ago, at the time of the preparation of the new German Customs tariff. These statistics were supplied to the Government by German manufacturers, and they may have been, in some instances, overstated, in order to give more importance to the respective branches of industry, and in some instances understated by manufacturers, who were afraid that their figures might be used as a basis for increased taxation. Taking, however, these returns, the total value of the various productions of ceramic industry, exclusive of those of brickmaking, in Germany in 1897 was 5,575,099*l.* The total value of porcelain ware alone amounted to 2,511,600*l.*, so that the total value of all ceramic productions of the more ordinary description, namely, stoneware, earthenware, tiles, &c., amounted to 3,063,499*l.* The total number of ceramic works, exclusive of those for brickmaking, established in Germany in 1898 was 939, whilst the total number of workmen employed in them was 71,983. The total number of brickmaking works in Germany, according to the last official census of 1895, was 16,431, and the total number of hands employed therein 219,860. Amongst these brickmaking works about 7,500 employed each not more than 5 persons, about 8,000 employed between 6 and 50 hands, and the remainder, namely, about 850, employed 52 hands and more.

If we compare the preceding figures with those given by the official census for 1882, it will be found that whilst the total number of hands employed in the German ceramic works, exclusive of brickmaking works, in 1898 largely exceeded the number employed in 1882, the total number of the works had considerably diminished in 1898. This proves that the German porcelain and pottery manufacturers had come gradually to the conclusion that in order to cope in a profitable manner with the increasing demand, as well as in order to meet foreign competition successfully, it appeared judicious to concentrate their efforts by reducing the number of smaller works, and carrying on the work in factories established, wherever possible, on a large scale.

As regards the prominent centres in Germany for brickmaking and for the various descriptions of ceramic industry, these are as follows, viz:—

Brickmaking, in view of the widespread presence of clay deposits in all parts of the country which are suitable for this industry, is carried on all over Germany, excepting of course in the mountainous regions, such as the Hartz Mountains, Thuringia, the Bavarian Highlands, the Silesian Mountains, &c. Earthenware drain pipes and other pipes: Manufactured chiefly in the district of Bitterfeld in Saxony, Münsterberg (Silesia), in the Lausitz district, in Rhenish Prussia, in the Palatinate, &c. Refractory bricks and earthenware for technical purposes: In Silesia, Hesse and Rhenish Prussia. Earthenware goods (faience): In Altona-Hamburg, Annaberg in Saxony, Bayreuth, Saargemünd, Nürnberg and Strassburg; and other kinds of earthenware vessels in Nassau, Bamberg, Bonn, Freising, Mettbach, Regensburg, &c. Stoneware tiles, &c.: At Annaberg, Aschaffenburg, Höchst, Mettbach, Bonn, Wittenberg, Zell, &c.; and stoneware vessels especially in Lorraine, Rhenish Prussia, the Saar Valley, &c. Fireproof stoneware (chamotte), crucibles, clay pipes, &c.: In Hesse, Silesia, Pomerania and Saxony. Stoneware: Remarkable for its light colour, at Mettbach; and stoneware vessels and tiles, with brown and white glaze, in Silesia. White earthenware goods: In a large number of places, and more especially in Saargemünd, in Schramberg, Dresden, &c. Terra-cotta ware: In Saxony, Thuringia, Charlottenburg, &c. Majolica: At Berlin, Meissen, Dresden, Hanover, Mayence, Frankfurt-on-Main, Nürnberg, Hildesheim, Munich, &c. Architectural ornaments: At Bitterfeld, Charlottenburg, Meissen, in Alsace, Treves, Aschaffenburg, Offenburg, &c.

In addition to the well-known porcelain works which belong respectively to the Governments of Saxony and

Prussia, namely, at Meissen and at Berlin-Charlottenburg, and which have done so much for the general improvement and development not alone of the porcelain manufacture, but of the entire ceramic industry of Germany, there are at present about 200 private porcelain factories in Germany, and in addition to these more than 1,000 other establishments occupied in painting, colouring, gilding and otherwise "finishing" porcelain ware, but, as a rule, not employing more than twenty workmen. Whilst the Meissen and Berlin porcelain works manufacture chiefly articles of luxury, most of the German private factories produce porcelain ware for daily or technical use. The centres of the private porcelain industry and of the finishing of porcelain ware are in Thuringia, Silesia, Dresden, Berlin, Lower Bavaria, Baden and in the Saar Valley.

Sir William Ward attributes the remarkable development in the export trade of German ceramic ware to foreign countries largely to the constant efforts made towards increasing the quality of the goods produced. The increase in quality which has taken place in German ceramic ware during recent years is attested by the fact, based on official statistics, that the average export value, which was about 12*s.* per cwt. in 1891, rose to 18*s.* per cwt. in 1900. Apart from the opportunities which are offered in Germany by other technical schools of a more general character for acquiring a theoretical knowledge of ceramic industry in its various branches, there are at present four special technical schools for this industry, namely, at Hohn, at Bunzlau, at Lanbau, and at Landshut, all of which are situated in the midst of the industries which they are intended to promote. Their aim is to afford a thorough combined theoretical and practical workshop instruction, and to train young persons for future positions as owners, managers, foremen, painters or modellers in the various branches of ceramic industries. The schools are maintained by subsidy, and are under the supervision of the governments of the German States in which they are situated. The statistics show that whilst, on the one hand, Germany imports from the United Kingdom large quantities of unglazed and glazed bricks, glazed earthenware pipes, muffles and capsules, as well as of ordinary white stoneware, Germany, on the other hand, exports to the United Kingdom much larger quantities of coloured, painted and gilt stoneware, and more especially white and coloured porcelain ware, in particular of coloured table services and of fancy porcelain.

DEFECTS OF TIMBER.

THE committee of the American Society for Testing Materials on standard specifications for the grading of structural timber have prepared a report on defects occurring especially in yellow pine and Douglas fir.

Structural Timber.—The term structural timber includes all such products of wood in which the strength of the timber is the controlling element in their selection and use. The following list of products were recommended for consideration as structural timbers:—Trestle timbers—stringers, caps, posts, mud sills, bracing, bridge ties and guard rails; car timbers—car framing, including upper framing and car sills; framing for buildings—posts, mud sills, girders, framing and joists; ship timbers—ship timbers and ship decking; cross arms for poles. It was recommended to omit for the present the following products:—Railway ties, poles, piling, car flooring and mine props. The following products were not considered to come within the work of the committee:—Vehicle woods, tank stock and packing-box materials.

Standard Defects.—The standard defects included in the following list are mostly such as may be termed natural defects, as distinguished from defects of manufacture. The latter have usually been omitted because the defects of manufacture are of very minor significance in the grading of structural timber:—(1) A sound knot is one which is solid across its face and which is as hard as the wood surrounding it; it may be either red or black, and is so fixed by growth or position that it will retain its place in the piece. (2) A loose knot is one not firmly held in place by growth or position. (3) A pith knot is a sound knot with a pith hole not more than $\frac{1}{4}$ -inch in diameter in the centre. (4) An encased knot is one which is surrounded wholly or in part by bark or pitch. Where the encasement is less than $\frac{1}{4}$ of an inch in width on both sides, not exceeding one-half the circumference of the knot, it shall be considered a sound knot. (5) A rotten knot is one not as hard as the wood it is in. (6) A pin knot is a sound knot not over

$\frac{1}{2}$ -inch in diameter. (7) A standard knot is a sound knot not over $1\frac{1}{2}$ -inch in diameter. (8) A large knot is a sound knot more than $1\frac{1}{2}$ -inch in diameter. (9) A round knot is one which is oval or circular in form. (10) A spike knot is one sawn in a lengthwise direction; the mean or average diameter shall be considered in measuring these knots. (11) Pitch pockets are openings between the grain or the wood containing more or less pitch or bark. These shall be classified as small, standard and large pitch pockets. (a) A small pitch pocket is one not over $\frac{1}{4}$ of an inch wide. (b) A standard pitch pocket is one not over $\frac{3}{4}$ of an inch wide or 3 inches in length. (c) A large pitch pocket is one over $\frac{3}{4}$ of an inch wide, or over 3 inches in length. (12) A pitch streak is a well-defined accumulation of pitch at one point in the piece. When not sufficient to develop a well-defined streak or where the fibre between grains—that is, the coarse-grained fibre usually termed “spring wood”—is not saturated with pitch, it shall not be considered a defect. (13) Wane is bark or the lack of wood from any cause on edges of timbers. (14) Shakes are splits or checks in timbers which usually cause a separation of the wood between annual rings. (15) Any form of decay which may be evident either as a dark red discoloration not found in the sound wood, or the presence of white or red rotten spots, shall be considered as a defect. The measurements which refer to the diameter of knots or holes are considered to be the mean or average diameter in all cases.

The “Auld Brig o’ Ayr.”

SIR,—In view of the extension of time granted by the Town Council of Ayr in which to report and submit to a public meeting a scheme for raising the sum of 10,000*l.* required for the preservation of the “Auld Brig o’ Ayr,” which extension of time expires on October 1 next, and until such public meeting is held, the arrangements for which are now being made, the voluntary committee, which has adjusted a working agreement with the Town Council of Ayr, in response to offers of assistance made by various societies and individuals, think it desirable and beg to give notice that subscriptions for this purpose will be received and duly acknowledged by Mr. W. J. Pollock, Bank of Scotland, Ayr, and that after the said public meeting has confirmed the said committee in office, added thereto, or elected a new committee, the said subscriptions will be published by the committee then placed in charge.—Yours, &c.,

R. A. OSWALD, Sir JAMES COATS, Bart., Hon.
HEW DALRYMPLE, GEORGE YOUNGER, M.P.,
ROBERT ANGUS, T. G. ARTHUR, WALTER
NEILSON, W. H. DUNLOP, JAMES KENNEDY,
HEW MORRISON, LL.D., DAVID SNEDDON,
J. C. HIGNET, JAMES A. MORRIS.

Honorary Architects.

SIR,—I should feel grateful if some of the more experienced readers of your valuable Journal would give me their advice on a point of professional etiquette.

Whilst spending my holiday at my paternal home I met two members of the building committee for a contemplated new chapel, and they suggested that I should offer my services as “honorary architect,” hinting that although I should not be paid the usual 5 per cent., I could still get the “customary trade discounts.”

I should like to know what is an “honorary architect.” None of the architects under whom I worked as pupil and assistant acted in that capacity as far as I know, so that I have had no experience of the practice.

I should feel obliged for information as to whether an “honorary architect” is usually paid for out-of-pocket expenses, and whether he does receive the “customary trade discounts.”—Yours, &c.,

YOUNG PRACTITIONER.

The Fund for the restoration of Winchester Cathedral, exclusive of Mrs. Ryle's Women's Fund, amounts to over 26,600*l.*

GENERAL.

The Awards have been published in connection with the competition for cottage models and designs which were on view at the recent agricultural show at Bredon's Norton. Mr. C. E. Bateman, of Birmingham, the assessor, awarded the prizes as follows:—For designs illustrated by models: First prize (15*l.*) to Mr. Henry Weaver, Gloucester; second prize (10*l.*) to Messrs. Hugo Bird and Robert Browne, Brentwood. For designs illustrated by drawings only: First prize (10*l.*) to Mr. A. Dennis-Thacker, Birmingham; second prize (7*l.*), to Messrs. Sam Cooke & Norman Twist, Birmingham. Mr. Bateman considered that the competition was very interesting, and had produced some good designs.

Mr. McCarthy, the city architect, has been instructed to prepare plans for a technical institute in Dublin, which will be adapted to the building and printing trades.

An Exhibition of works by Albert Bartholomé, the sculptor of the great memorial “Aux Morts” in the cemetery of Père-la-Chaise, Paris, is to be held in the winter in Berlin.

A Garage for motor cars will be among the additions to the Elysée, Paris. The Chamber voted 8,000*l.* for alterations to the palace.

The Stone Circle at Brodgar, Orkney, is being preserved under the direction of Mr. Myers, architect. All the cracks are filled in with cement. A concrete base has been laid down for the watch stone.

The Designs for the technical school, Burnley, which were prepared by Mr. Pickles, borough surveyor, have been approved by the Board of Education. The cost will be over 60,000*l.*

The Lancashire Asylums Board have resolved to proceed with the erection of a block to accommodate 100 patients on the site recently purchased at Whalley, together with an administrative block suitable for an asylum for 2,000 patients. The special committee considered the relative merits of an asylum built on the “block system” and the “villa system.” In the opinion of the architect a complete asylum on the villa system would cost probably between 15*l.* to 30*l.* a bed more than an asylum on the block system. The Board have postponed deciding which system will be adopted for the entire scheme.

Mr. W. H. Goss, of Stoke-on-Trent, a well-known potter, who at the International Exhibition of 1862 won the award for the manufacture of articles in ivory porcelain, and was the inventor of the coloured enamels used in heraldic pottery, died on January 4, leaving property which has been sworn at 59,603*l.* gross. By his will, testator gives to the Mayor and Corporation of Stoke-on-Trent two old oak chairs and two large old oak cabinets containing his collection of antiquities and curios and certain works of art for their museum, they providing a room or rooms for the reception thereof. Should they not agree to such terms, the same offer is to be made to the Mayor and Corporation of Hanley.

The Council of the Glasgow Archæological Society were recently informed that the president of the Society (Mr. J. D. G. Dalrymple) proposed to establish in Glasgow an archæological lectureship on the lines of the “Rhind” lectureship, in celebration of the jubilee of the Society, which is to be commemorated by a banquet in the Windsor Hotel on Friday, November 2. Mr. Dalrymple proposes that the appointment should be in the hands of the Council of the Society, the honorarium to be 50*l.* for five or six lectures, to be delivered in the University. The Council unanimously resolved to record its deep appreciation of the public spirit of the President.

The Liverpool Cathedral site now presents an appearance of subdued activity, betokening steady progress in preparation for the erection of the superstructure. The staging erected for the chapter-house foundation stone-laying has, remarks the *Diocesan Gazette*, been removed, and masons may be seen at work on the plinth of the lady chapel. Some idea may even now be gained of the busy scene which will greet the visitor's eye at no very distant date when the works are in full progress. Electric cranes and other machinery, including three electric saws for cutting the stone, occupy suitable positions on the ground, and as the stone is cut it is passed on to the masons to be dressed and shaped. We are rapidly approaching the most interesting stage of the cathedral building operations yet reached.

The Architect.

THE WEEK

We published last week the memorial of the local architects to the Dundee Town Council relating to designs for the branch libraries which are about to be erected. A deputation of the architects appeared before the Council, and Mr. T. M. CAPPON acted as their spokesman. It is proposed that the designs should be prepared by the burgh engineer. But Mr. CAPPON contended that the duties of the office were too manifold for him to give attention to the subject, and the work would have to be delegated to irresponsible assistants. In other towns the designs were obtained by competition or prepared by architects who possessed special knowledge of libraries. It was on æsthetic grounds, as well as being citizens and ratepayers, that the architects appealed to the Council to make arrangements by which the libraries would acquire a monumental character. One member of the Council in reply pointed out that, if the competition system were adopted, it would be necessary to employ an assessor and to give premiums to those whose designs were placed second and third. That would mean an outlay of 900*l.*, which would not be approved by the ratepayers. Eventually eighteen members decided in favour of employing the Corporation official, while only seven voted for competition. From the result it will be evident that the crucial test which is employed in such cases is that of economy. An architectural assistant or two may be employed, and by the aid of that machinery public buildings can, it is believed, be properly designed. It is also recognised that an assessor must necessarily be a stranger, and probably the architect who obtained the first prize might likewise be one. To give outside architects 1,000*l.* as a share in the spoil, as one councillor expressed it, is especially obnoxious to the Scottish mind. But the speaker would, no doubt, become excited if he found that Scotsmen were excluded from competitions in the South.

It is generally known that a theatre existed on part of the site of the ancient Abbey of Blackfriars, close to where the publishing office of the *Times* now stands, and not far from the office of *The Architect*. The building was probably erected by JAMES BURBAGE—that wonderful joiner and actor—who was the first to put up a theatre in another part of London. His sons, CUTHBERT and RICHARD, carried on his business, and RICHARD was the most famous tragedian of his time. The late J. P. COLLIER professed to have discovered several important documents relating to Blackfriars Theatre and its proprietors, of whom SHAKESPEARE was one. Unfortunately, it is impossible to distinguish between genuineness and fabrication in any of COLLIER's discoveries. Quite recently Mr. JAMES GREENSTREET found among the unindexed documents in the Public Record Office several which related to the theatre, and now Professor WALLACE, of the University of Nebraska, has informed the *Times* of other discoveries by himself. Investigators are always apt to overvalue old documents, especially when they relate to buildings. BURBAGE, it is believed, employed "the wooden O" in planning his theatres; and it is supposed that form prevailed during the Elizabethan and Jacobean period. But Professor WALLACE says:—"From the evidence of documents now available, it is possible for an architect to reproduce the general structure and many details of both the exterior and interior of the Blackfriars Theatre. The building was a stone structure erected in two sections. One section adjoined the Pipe Office, the place where the rolls of State parchments large as drain-pipes were kept. It was full two storeys high, with dormer windows in the third storey and a garret above. The roof was steep, with gable-end facing north on Pipe-Office Yard (now Playhouse Yard).

The number, location and use of the various rooms in this section is given by different documents. The main section containing the auditorium and stage of the theatre was on the south. This section was two storeys high, and had originally a low or flat roof. But BURBAGE in remodelling it changed the shape of the roof and built certain rooms above the great hall. There were also 'cellar' or basement-rooms which were used for apartments. The auditorium proper occupied about half of the available space of the building." He calculates that it had a seating capacity of 500, and was the most fashionable and aristocratic theatre in London. Professor WALLACE intends to publish the documents *in extenso*, and they are likely to cause some excitement when they appear.

ANOTHER reservoir in connection with waterworks has to be abandoned. The Leeds City Council obtained in 1901 an Act which among other powers authorised the construction of what was called the Colsterdale reservoir. A new waterworks engineer was subsequently appointed, and from an examination of the site faults were found which would make the work risky. He asked to have the aid of an expert (Mr. H. ROFE), and a joint report was prepared in which it was recommended to erect the reservoir in a different position. Money has been expended without advantage. But it is considered that the alteration will save the ratepayers over half a million of money. The Town Council have approved unanimously of the recommendation. It must be expected that in dealing with foundations defects will arise which no foresight could have avoided. Tests can be made by boring and digging, and the sections of the Geological Survey yield exact information about strata. But all this is not sufficient. In engineering works this additional outlay is generally accepted like an unforeseen loss in trading. But whenever defects arise in foundations for buildings then clients, whether public or private, are sure to ascribe the necessity for additional outlay to the negligence of the architect. There ought at least to be as much allowance in the less costly case as is granted with respect to the numerous reservoirs which have lately involved ratepayers in extraordinary works in order to avoid catastrophes.

LAWYERS sometimes profess to have a difficulty in deciding on the manner in which an architect's claim is to be presented to the Courts. But the tactics adopted in an American case, as explained in the *American Architect*, are unmatched among English precedents. The plaintiffs, Messrs. PACKER & THOMAS, architects, of Boston, sued the National Bank of Commerce and Commercial Realty Corporation for about six thousand dollars, balance unpaid of their account. It might be considered a simple affair, especially as the defendants' plea was that the building was delivered to them two hundred days later than the stipulated time. But there are no less than seven heads in the declaration prepared by the plaintiffs' lawyers. The first is that suit is brought for "goods bargained and sold by the plaintiffs to the defendants." The second, that it is for "work done and materials provided by the plaintiffs for the defendants, at their request." The third, that it is for "money lent by the plaintiffs to the defendants," and so on, "money" being referred to in three other counts. But nowhere does it appear that the claim rests upon the exercise of professional knowledge and skill. The lawyers and perhaps their clients appear to be sternly materialistic and not at all sentimental. How it happens that architects have been lending money to their clients, unless in the shape of car-fares on some inspection trip, we cannot imagine. One thing appears plain from the language of this declaration: the architects can have no intention to set up a plea of ownership in the drawings made by them, since these obviously must have been amongst the "goods bargained and sold" by them.

THE WHITEHALL CEILING PAINTINGS.

THE proposal to expend 2,000*l.* on the restoration of the ceiling paintings in the Banqueting-hall of Whitehall will, of course, create some interest in a work which is known to the majority of people only by repute. It must be considered as somewhat anomalous in character, for it is not adapted for the adornment of a royal chapel unless for the gratification of worshippers who could look on King JAMES I. as a sort of demi-god,

Aloft we view the Bacchanalian king,
Below the sacred anthems daily sing.

But when the arrangements for the work were entered into, it should be remembered that the great room or hall was not employed as a chapel. The Banqueting-hall, as everyone knows, is only a fragment of a palace having a façade of nearly 1,200 feet in length. There were to be seven courts with different names, each being treated in a different manner. In the Persian Court, Persian warriors and Persian ladies were made to support Doric and Corinthian capitals. But the project was beyond the resources of the king, and a second design was made on an economical scale and of an inferior character. If the original design were carried out, Whitehall would bear comparison with the Louvre and would be one of the great buildings of Europe.

It is well to remember that when JONES designed the ceiling he divided it into nine compartments, the central one being an oval. There is no evidence whether he intended that the spaces should be filled in with paintings. JONES was a painter both of landscapes and figures, and the beautiful pageantry of the Court masques was due to his hands. Whether after consultation with the architect or not is now doubtful, but in 1621—*i.e.* four years before the death of King JAMES—a desire was expressed for RUBENS to paint the ceiling. This is evident from a letter written by the painter, in which he says:—"As to His MAJESTY and H.R.H. the PRINCE OF WALES, I shall always be very pleased to receive the honour of their commands, and with respect to the hall in the new palace I confess myself to be by a natural instinct better fitted to execute works of the largest size rather than little curiosities. Everyone according to his gifts. My endowments are of such a nature that I have never wanted courage to undertake any design, however vast in size or diversified in subject." At the time the order was given the Banqueting-hall must have been in an unfinished state or extraordinary expedition was used in its erection, for the hall in the ancient palace of Whitehall stood until January 1619, when it was burned, the fire being attributed to a couple of labourers.

RUBENS was living in Antwerp, but as he was a diplomatist of high rank he was well known to ambassadors from England, to various continental countries and to political agents. He arrived in London in 1629, and then more definite arrangements were drawn up about the pictures. He made sketches of what CHARLES desired while here and he commenced the works on his return to Antwerp, where, it is believed, he had the assistance of JORDAENS. The sum which RUBENS was to receive was 3,000*l.*, to be paid before August 1634. On August 1 BALTHAZAR GERBIER, who was one of the agents of King CHARLES, and was afterwards ambassador in Brussels, informed the king that Spaniards, Frenchmen and others were talking maliciously about the great works which Sir PETER RUBENS had made for His Majesty's Banqueting-house, and which were lying in Brussels as if for want of money. GERBIER wrote still more freely to Sir TOBY MATTHEW, begging of him to urge the Lord Treasurer to send the money at once in order that the rumours about the pictures being, as it were, in pawn might be removed. GERBIER's interference was not considered satisfactory. But he defended his action by saying he was a royal sentinel and bound to relate what he heard while on watch.

Not until the following year was GERBIER instructed to send over the paintings. Then difficulties arose with respect to customs; for apparently Holland as well as England would not allow them to pass without paying toll. In those days customs were often farmed, and the men who held them were not disposed to look on anything as sacred. RUBENS said that in Zealand the toll would be five or six per cent. on the value of the pictures, unless some in authority would forego their rights. One adviser said that in law RUBENS was bound to deliver the pictures in England, and therefore should pay all tolls and customs out of his own purse. RUBENS got out of the difficulty by declaring that the state of his health did not permit him to take charge of the transport of the pictures to England. The paintings, from being rolled up during a year, were injured, and it was found necessary to retouch them and to mend the cracks in the canvas. CHARLES, we suppose, had raised sufficient money and offered to defray all expenses. Then GERBIER implored RUBENS to obtain for him some repose by giving information as to when the pictures would be in a fit state to be packed for England. But RUBENS was deliberate in his mode of acting and left GERBIER without a reply. The envoy was afraid he might be blamed, and he therefore wrote to the king explaining that he was not responsible for the delay, and that as soon as RUBENS was ready the pictures would be despatched for London. At one time RUBENS thought of waiting until the pictures were placed in position, when he would cross over to London and retouch and over-paint them. Then he changed his mind, fearing that the gout would prevent him working in England, and he thought it would be preferable to do the work in Antwerp. GERBIER is next informed that all the pictures are finished except one which could not be dried for eight or ten days. But at last they were delivered and despatched to the agent at Dunkirk. Then the man in whose charge RUBENS had placed the cases fell ill, and it was not until the end of 1635 that the pictures were received in London. It does not appear that RUBENS was paid his 3,000*l.* until the end of June 1638, when the last instalment was made over.

The subject of the ceiling paintings was to be the allegorical history of JAMES I. As CHARLES sent RUBENS a gold chain weighing 82½ ozs., we may presume he was satisfied with them. We have no evidence of any independent opinion by a spectator. WALPOLE says of the work:—

The design is the apotheosis of King James, for whom, when once deified, there seems to have been no further thought of erecting a monument. The original sketch for the middle compartment is preserved at Houghton; it had belonged to Sir Godfrey Kneller, who often studied it, as is evident by Sir Godfrey's original sketch, at Houghton, too, for the great equestrian picture of King William at Hampton Court, though in the larger piece he seems to have forgot that he ever had studied the former design. Sir Godfrey had heard that Jordaens assisted Rubens in the execution; if true, some of the compartments must have been painted in Holland and sent over hither, for I do not find that Jordaens was ever in England. Rubens received 3,000*l.* for his work. The building itself cost 17,000*l.* What had it been if completed! Vandyke was to have painted the sides with the history of the Order of the Garter. Inigo Jones, Rubens and Vandyke! Europe could not have shown a nobler chamber. Kent in the late reign repaired the painting on the ceiling.

The Banqueting-hall was in use as a chapel from 1724 till 1890. During that time the Bacchanalian scene and the half-naked figures were to be discerned in spite of all the rules and regulations against the introduction of paintings into churches. Probably from their inappropriateness they would not be deemed illegal. The paintings were also restored by CIPRIANI, an artist whose style was not in keeping with that of RUBENS. As the building is now used as a museum no objection can be raised against retaining the paintings of the great Fleming. But it is to be hoped they will

be entrusted to some one who will be competent to treat them properly. It is absolutely necessary to do something, for at present the series appears to have little artistic value, and does not aid in the decoration of the hall. Vigorous as was RUBENS in his handling he could not compete with the atmosphere of the Metropolis.

PUMPING OPERATIONS AND THE RIGHTS OF NEIGHBOURING OWNERS.

IN *The Architect* for February 2 of this year we discussed the question of the rights of surface owners to stop pumping operations when the result of such operations was to let down the surface of their ground. The cases there discussed clearly show that when pumping operations withdraw water and silt from under a neighbouring surface owner's land, and probably where they withdraw water only, and a subsidence ensues, the surface owner has a right of action. But these cases also show that the law does not recognise any proprietary right in underground water which percolates in undefined channels; so that if A. by his pumping operations withdraws B.'s underground water, and such withdrawal does not affect B.'s surface, B. has no cause of action. The case of the Salt Union, Ltd., v. BRUNNER, MOND & Co., LTD., decided last month by the King's Bench Division, is a difficult case upon this subject, which does not seem to fall exactly within either of these principles. It is really a case of first impression, and will probably be taken to the Court of Appeal and the House of Lords. The facts of the case are as follows:—The defendants were the owners of a shaft and of a certain area of rock salt known as Penny's Lane, near Northwich, in Cheshire. The plaintiffs owned a number of adjoining salt mines. The defendants pumped salt brine through their shaft. This salt brine was in part derived from the dissolution of rock salt in the plaintiffs' mines. In consequence subsidences occurred, and the plaintiffs sued for damages for these subsidences, and also for the abstraction of their salt.

In these salt districts the extensive mining of salt and the extensive pumping operations for salt brine have caused very frequent subsidences. In view of the number of miners and pumpers in the district it was found very difficult to say what mining or what pumping caused any particular subsidence. Parliament therefore passed an Act in 1891 which provided for compensating persons other than miners or pumpers for subsidences. In this case the Court held that though the defendants' pumping may have caused subsidences on the plaintiffs' property, it was impossible to say to what extent the subsidences in question were to be attributed to the various operations which were being carried on by both plaintiffs and defendants. That being so, the Court held that it was impossible to find for the plaintiffs in respect of the damage caused by the subsidences.

The second question, whether there was any right of action for the salt abstracted, raises the really difficult point of law. The Court found as a fact that the pumping operations of the plaintiffs had abstracted salt brine from under the defendants' land. Did this give any cause of action to the plaintiffs? At first sight it would appear that it ought to do so. The defendants had clearly appropriated a part of the soil belonging to the plaintiffs. It is true that if the defendants had merely pumped up underground percolating water, the plaintiffs would have had no cause of action merely for the abstraction of the water. But here it was not merely water; it was valuable mineral which had been abstracted. On the other hand, it was said that the mining and pumping operations carried on for many years in this district had introduced a wholly artificial state of things. Just as it was impossible to say, when any subsidence occurred, who was really answerable for it, so it was impossible to say, when a shaft was sunk and pumping operations begun, what area such operations would

affect. The reason why the law recognises no right of property in underground percolating water is that it is difficult to say to whom such water really belongs; and therefore it is better to allow any owner to pump as he pleases than to attempt to settle questions as to the ownership of such water, which, by the nature of the case, must be nearly impossible of solution. This reasoning really applies to the pumping of brine in cases where the district has been so honeycombed by mining and pumping operations that it is impossible to say to whom the salt brine pumped up really belongs. It was these arguments which convinced the Court and led it to hold that the abstraction of salt brine under the circumstances gave no cause of action.

There is much to be said on both sides of the case. The Lord Chief Justice admitted that his mind had fluctuated during the arguments and the consideration of the case. The correctness of the decision must really depend upon the proposition that it is really impossible to say what amount of brine was taken from the plaintiffs' land. We should remember, however, that it was clear that some had been taken, and, between the pumping of underground water and the pumping of salt brine there is this difference: in the first case no part of the soil is removed, in the second case valuable mineral is abstracted. The law may well say that it recognises no right of property in underground water flowing in undefined channels: it can hardly be contended that this proposition is true of salt brine. And if this is so, it goes far to destroy the analogy between pumping water and pumping brine. It may be difficult to accurately measure the amount taken; but if it is clear that some has been taken, we doubt whether this difficulty of accurate measurement deprives the plaintiffs of all right to damages. If it does the case is a hard one for the plaintiffs. We shall await with interest the decision of the Court of Appeal and the House of Lords on this new and difficult point of law.

THE CATHEDRAL CLOISTERS AT GERONA.

By ARTHUR WATSON.

THE cloisters of the cathedral at Gerona are of interest on account of their construction and as containing a remarkable series of carvings representing Scripture scenes, monsters and foliage.

The plan is quite irregular, no two of the four sides being of the same length and none of the angles being right angles. This irregularity does not make itself felt as unsatisfactory. It is not the result of caprice on the part of the builders, but arises from definite determining conditions.

The directions of the north and south walls are fixed, the former by the line of the fortified portion of the city which is itself determined by the natural formation of the land, the latter by the orientation of the cathedral. The south side is a line from west to east, the north a line from west to a little south of east. The two remaining sides run from south in a northerly direction, and complete a figure which is nearly but not quite a trapezium.

On the north side the vaulting is semicircular, whereas on the south, west and east sides it assumes the unusual form of the quadrant. The semicircular vaulting has been used where the outside wall does not adjoin any part of the monastic building, and the quadrant where it may serve the purpose of support; it is, in fact, in the happy mode of expression hit upon by Viollet-le-Duc, a continuous flying buttress. On the south side the cloisters now adjoin the north wall of the cathedral. The east and west sides adjoin what were formerly the dormitory and refectory respectively. The builders have thus, both in the general plan and in this variation in the vaulting, had real constructive reasons as determining factors.

Within the quadrangle is a little stone building surrounding the opening for the well. M. Gailhabaud, who made a special study of the construction of wells in the Middle Ages, has remarked on this one in the cloister of Gerona as being the earliest of the kind of which he had knowledge. In wells built by the Romans he found that no provision for the use of the pulley was made, and this fact he considered the more remarkable as the wheel and

FIG. 1.

FIG. 3.

FIG. 2.

FIG. 4.

FIG. 5.

FIG. 6.

axle and the pulley were not unknown to them. This consideration led him, somewhat fancifully, to the conclusion that the use of the pulley for this purpose was due to the Christians' desire to reduce the labours of subordinates, and thus he looked upon this feature as symbolical of the new religion.

This cannot be regarded as more than a too rapid conjecture. The fact, however, to which M. Gailhabaud draws attention is interesting, viz. that the cathedral cloisters at Gerona furnish a prototype of later elaborate structures for sustaining an overhead pulley.

FIG. 7.

FIG. 8.

The cloisters date from the eleventh century or the beginning of the twelfth.* On three sides they are ornamented by carvings representing Scripture scenes; on the north side by foliage patterns. At the corners, and also between the extremes of the sides, are blocks of masonry (see figs. 1-6) occupying the space between the four pillars, and on the sides of these blocks, filling the intervals between the capitals, are stories from the Old and New Testament, forming a kind of frieze. The capitals of the

twin shafts are also in some cases storied, but for the most part they are occupied by foliage or grotesque animals and birds. The Scripture scenes begin with Genesis.

The following is an almost complete list:—

Old Testament.

- The Creation of Woman.
- Adam and Eve in Paradise.
- The First Sin.
- Adam and Eve driven from Paradise.
- The First Labours.

Fig. 9.

FIG. 10.

- The Death of Abel.
- The Curse of Cain.
- Building the Ark (see fig. 2).
- Noah and his family entering the Ark (see fig. 3).
- The three angels at the door of Abraham's house (see fig. 4).
- Abraham sending his servant to seek a wife for his son Isaac.
- The Blessing of Jacob.
- Esau returning from hunting.
- The Dream of Jacob.
- Rachael's flock.
- Jacob and Rachael.

New Testament.

- The Murder of the Innocents.
- The Flight into Egypt.
- The Annunciation.
- The Nativity.
- The Adoration of the Magi.

* See Bassegoda, *La Catedral de Gerona*, Barcelona, 1889.

On the west side is a piece of sculpture representing two men carrying a heavy vat or wine-press, while a man behind is bearing a jar with difficulty (see fig. 6). At first this may suggest the return of the spies from the land of Canaan, but Mediæval sculptors would probably not have ventured to substitute a vat for the grapes of the Bible story. The opposite face, however, of the block of masonry on which this subject is represented shows a bishop blessing the first stone of a building, and two masons. Fig. 6 may, therefore, as Joaquin Bassegoda suggests, be intended to represent a workman carrying water and two others bearing mortar, or it might be intended for one of the occupations of the months. At San Cugat del Vallés, near Barcelona, on one of the capitals of the cloisters is a similar representation, though much more damaged (see fig. 7).

The building of the Ark gives an insight into carpenters' work, the workmen using saw and hatchet. The hands and heads of the figures are large in proportion to the rest of the body, and the hair is represented somewhat conventionally, in this as in other subjects, as terminating in volutes. Noah and his family entering the Ark is one of the best of the scenes, and it is noteworthy that a good deal of care has been taken in the carving of the folds of the dress.

The Ark is, of course, quite inadequate.* It is but a small boat. Its line approximates to that of a semicircle, as in many Mediæval representations, and the planks of the sides are marked by studs. (Cf. British Museum MSS. 19 D. ii. f. 13b, and "Nero," C. iv. f. 3, and the seal of the town of Dover in J. R. Green's "Short History of the English People," vol. i. p. 339.)

Want of proportion is perhaps most strikingly shown in representations of Jacob's Dream, where obviously the distance between earth and heaven cannot be made to scale. It can only be attempted on the understanding that the representation is conventional and the imagination is left free play. Yet in spite of obvious inadequacy in this respect, as judged by modern standards, these sculptures in the cloisters of Gerona have, like many representations of the kind to which they belong, life and go in them. They suggest the Bible story, and at the same time bridge over eight centuries and place before our eyes common objects and common events as they appeared to the sculptors who executed them.

The rectangular Scripture scenes are bounded on each side by sculptured foliage or grotesque animals. In fig. 2, for instance, on the right is a bird form with a human head, which in fact overlaps the principal subject.

At the north-east angle is a richly carved foliage scroll, which is so arranged as to give nearly the same pattern when inverted (see fig. 8). The capital to the left has bent leaves of the acanthus type, enriched by many drilled holes, and above are diminutive well-defined volutes. This capital is of a type common in Southern France, but rare in England and Normandy. Other examples of capitals of a like kind exist in the cloisters of San Cugat del Vallés (see fig. 9), in the church of San Pedro de Galligans at Gerona, in the cloisters of San Juan de las Abadesas, and in the apse of the cathedral of Santo Domingo de la Calgada.

It may be noted that the inner or quadrangle sides of the abaci (see fig. 1) are level with the outer face of the wall, the wall receding where the arches rest on the abaci, and that the outer arch is supported by short and slender shafts surmounted by carved capitals.

From the west side of the cloisters the open door at the north reveals the outer world, framing the view of the opposite hill gilded by the bright sunlight, while the cloisters themselves are cool and shady. The glimpse intensifies the repose of the cloisters. Here the passing priest may enter into friendly conversation with the traveller, and of fresher interest to him than the surrounding treasure are such questions as the cost of travelling to England.

From the north side may be seen the giant buttresses, deeply projecting solid walls of masonry rendered necessary to support the vault of the nave with its extraordinary span of 73 feet, an enterprise the nature of which is realisable by means of documents dating from the time when the con-

struction was in contemplation, in which the opinions of experts as to the practicability and safety of the proposed undertaking are set forth (see Street, "Some Account of Gothic Architecture in Spain," pp. 501-13).

Apart from the intrinsic interest of the existing architecture of the cloisters, with their treasures of sculpture and romantic surroundings, an added interest is to be found in the fact that this peaceful retreat is set in a city which still retains so much that is Mediæval, and offers a wealth of subjects for the painter, etcher, and for the traveller who can bring away with him nothing but the remembrance or the records of his camera.

SOANE'S LAST LECTURE.

FEW architects obtained a larger measure of worldly success than Sir John Soane. The son of a brick-layer, his first occupation was as an errand-boy in the office of George Dance, the architect. As he made himself useful in other ways he was subsequently treated as if he were a pupil. He was sufficiently competent to enter Holland's office as an assistant. Soane gained the gold medal and travelling studentship of the Academy, and his three years' residence in Italy were profitable to him. On his return he commenced practice, and was able to gain appointments as well as commissions. Having been elected associate in 1795, he became an Academician in 1802, and in 1806 was appointed professor of architecture. He held the office until 1833. Soane delivered his course of lectures in the Academy for the last time in March 1832, and then he expected to deliver another course, in which he was disappointed, for owing to the failure of his sight he resigned his numerous appointments.

The following report of the final lecture has been preserved:—

Having in the previous lectures traced the progress of the art, from its first rise among the ancients through all its periods of prosperity and depression, and latterly from its revival in Italy in the fifteenth to the close of the eighteenth century, the Professor devoted his concluding lecture to an analysis of the practice of the ancient artists, and a comparison of it with that of the moderns in some of the leading features of the art.

He began with arches, of which, he observed, the origin of their introduction into architecture is extremely difficult to be ascertained. The triumphal sort of arches, he remarked, were not general until the age of Augustus. He next adverted to the construction of bridges, commented on the peculiar beauty and picturesque appearance of those foundations in effecting the union of two opposite shores. Among all the examples of this style of building at present existing none, he observed, claim more admiration than those of China, which indeed are pre-eminent for their magnitude and extent. The bridge of Kingtunc affords a splendid instance of the grandeur resulting from those qualities. The bridge of Ispahan, and those erected in ancient times, of which we have little more left than descriptions—Trajan's bridge over the Danube, Cæsar's over the Rhine, &c.—are likewise deserving the careful study of the young architect. Our own bridges of Blackfriars and Westminster are, however, never to be omitted from the list of the celebrated—the first conspicuous for the beauty of its proportions and magnificent aspect, the last for its utility and characteristic effect. Dismissing this subject, the Professor next adverted to the practice of ornamenting domes, which is carried to a far greater extent in modern than in ancient times, and frequently without any visible connection or analogy with any other part of the building. He pointed out the ill effect arising from the erection of the lantern on the domes of even the beautiful churches of St. Paul and St. Peter. To the dome he attributed the origin of the spire, and both, he observed, might perhaps find their prototype in the obelisk, an erection appropriated by the ancients to the worship of the sun. He instanced the injudicious erection of spires on the tops of roofs, and contrasted those examples with others in which the spire rises pyramidically from its own base, in which latter the outline is generally pleasing and the whole effect appropriate. He next adverted to the application in buildings of staircases, vestibules, saloons and galleries, all of which offer a wide range for the ingenuity and invention of the architect. The appropriate and injudicious selection of ornaments for buildings was the subject which next engaged the Professor's attention, and while upon it he was naturally drawn to a conspicuous

* Representations of this period almost inevitably lack proportion, and especially is this the case in sculpture. It may be interesting to note that in the representation of the Ark on the west front of Auxerre Cathedral (fourteenth century) this want of proportion is felt, as the sculptor has recognised the difficulty of doing justice to the subject within the space of one panel, and has allowed his subject to extend over two. (See W. R. Lethaby's *Mediæval Art*, plate li.)

example of the latter description in this Metropolis, Bloomsbury Church, the steeple of which is surmounted by a statue of George II. This absurdity has given rise to the following epigram:—

When Harry the Eighth left the Pope in the lurch,
His Parliament made him the head of the Church,
But George's good subjects, the Bloomsbury people,
Instead of the Church made him head of the steeple.

He then entered into a minute description of the modes of decoration used by the ancient architects, and contrasted the good taste exhibited by them with the extravagant and ill-chosen style of ornament adopted by more modern artists. For the encouragement of the growth of a pure taste in architecture, as well as in every other branch of the fine arts, the family of the Medici in Italy did much; and he hoped that under the fostering influence of similar patronage, England too would have to boast of her Raphaels and Michel Angelos. In the best works of the ancients, he continued, there is observable a propriety of design and a singular harmony of every part of the building, which is never interfered with by the introduction of heterogeneous ornaments, so fatal to the unity of many modern edifices. In order to avoid this blemish, he recommended the architect constantly to aim at imparting to his constructions a positive character—to neglect no part, however unimportant it might appear; but, by giving to each and every portion its due weight and significance, to produce that fitness and harmony he had pointed out as the standard of excellence. The ancient writers, he observed, recommended the study of music to form part of an architect's education, conceiving, perhaps, that a relish for the harmonies of tone would induce, by a sort of sympathy, a corresponding taste for those of proportion.

The profession of an architect he considered beset with many difficulties, of which the sister professions, those of painting and sculpture, are happily ignorant. The architect alone is subject to that fearful ordeal, the obligation of showing his work during its progress; his designs are besides frequently counteracted by circumstances beyond his control, and too frequently interfered with and altered to suit the purposes of economy or the contingencies of locality. He lamented that in this country the mechanic is but too often identified with the regular architect, who ought to be as distinct from the builder as the physician is from the apothecary. The architect should never be the contractor, nor ought the profession to be subject to those constant squabbles respecting building expenses so degrading to its character. The Ephesians are stated to have adopted a good regulation with regard to such matters. Among those people, it is said, the builder was required, previously to commencing his work, to resign over to the public treasurer his whole property, and if, on the completion of the building, it were found that the expenses exceeded by one-fourth part the stipulated amount, his goods were appropriated to the liquidation of the excess. The Professor entreated the students to recollect that their art, valuable and important as it is, owes all its value and importance and all its power of pleasing to its utility. It may, he continued, be considered an art pre-eminently calculated to call forth the latent energies of genius; but not all the graces of invention nor the charms of execution can compensate for the sacrifice of that great and leading principle.

The Professor, in conclusion, stated that he had endeavoured in the course of the lectures now terminated, to render his observations as useful to the students as he possibly could. He had entered upon the task with fear and trembling, but he had brought to it the whole of his zeal and attention. In the prosecution of his labour he had sought to instruct the students in the laws and principles of their art, and to point out for their guidance the faults and beauties of those masters who have preceded them. Much, however, yet remained to be noticed, nor could he comprise all he had to say within the narrow limits of six lectures. He would, therefore, next season add to the present lectures six others entirely new, in order that he might enlarge upon some of the chief principles of the art, and the more important duties of the architect. When he had completed the work he had thus allotted to himself, he would direct the twelve lectures to be printed, not for public sale, because it would be done from no feeling of vanity, but for the use of the students of the institution of which he is a member; so that if he could not say with the poet,

Exegi monumentum ære perennius,

he would yet have the satisfaction of feeling that he had

devoted his best efforts to facilitate and advance the study of architecture. Nay, that he might "whet the almost blunted purpose" of the Legislature he would direct in his will that after the death of his grandson, his natural heir, the house in which he resides, in Lincoln's Inn Fields, shall be placed under the control of trustees, who shall be empowered to allow from its proceeds a salary to a professor of architecture until such time as a national establishment for the fine arts shall be formed in this country—that then the trust shall cease and the estate revert to the next heir-at-law then existing.

This announcement was received by the numerous audience assembled in the lecture-room by loud cheers.

Sir John Soane not only made a will, but in 1833 he obtained a private Act which empowered him to vest his museum, library, &c., in trustees. The reference to his grandson as his natural heir in his last lecture was another way of expressing the alienation between him and his son, and which continued to the end of Sir John's life on January 20, 1837.

SCOTTISH BROCHS.

AMONG the various relics of the past which time has spared the Scottish brochs possess a special interest, both because they are a type of building absolutely peculiar to that country, and from the fact that they show that the prehistoric architects who constructed them possessed alike forethought and resource in working out the idea of an edifice so admirably suited to fulfil the objects for which it was intended. A broch might shortly be defined as a hollow, circular tower of dry built masonry, from 40 to 70 feet in diameter, having within the thickness of its walls a series of chambers and galleries lighted by windows, all looking into the central area. The only aperture to the outside was a doorway through a tunnel-like square-headed passage, with slightly inclined sides 5 to 6 feet high and about 3 feet wide, constructed in the thickness of the wall. The latter (which was from 9 to 20 feet thick) was solid for about 10 feet from the ground, except where it was pierced by the entrance or partially hollowed out by the construction of oblong chambers with rudely vaulted roofs. Above this the wall was carried up with a clear space of about 3 feet wide between the exterior and interior portions. Into this hollow horizontal ranges of slabs were inserted at intervals of 5 or 6 feet, thus forming galleries about 6 feet high and 3 feet wide, which ran completely round the tower. These galleries were connected by a stair which ran up to the top of the tower, and were lighted by windows in the inner wall of a peculiar construction, placed vertically over each other. The central area was from 20 to 45 feet in diameter. It is difficult to say with certainty what must have been the original heights of the brochs, as the upper portions of all the specimens known have been demolished. The best preserved is the broch of Mousa in Shetland, which though incomplete at the top is 45 feet in height, so that they must have, occasionally at any rate, attained an altitude of 50 feet. The door (which would be a slab of stone) was placed about 4 feet from the outer end of the tunnel-like passage against a rebate in the masonry, faced with strong slabs. It was secured by a strong bar fitting into holes made for the purpose in the side walls. In most cases there was also a guard-chamber opening off the passage just behind the door. The object of the builders of the brochs was undoubtedly to provide a place of temporary shelter and defence to which they could retire with their cattle and other valuables during the raids and forays of foreign marauders, which at the time of their construction were constantly occurring in the north and west of Scotland. As a general rule, therefore, these curious edifices were situated in districts of some fertility, and the buildings most admirably fulfilled the purpose for which they were intended. The brochs are unmistakably Celtic in their character, and are peculiar to Scotland. They do not bear any proper relationship to any variety of fortified edifices known in historic times. They have been compared to the round towers, but while in outward appearance there was a certain amount of similarity, and both buildings seemed to have been intended for the same purpose, there are marked and signal points of difference. According to one authority in the five northern counties there were 370 of them.

Mr. Barnett has bequeathed to the Painters' Company a sum of 100,000*l.* Part of the interest must be expended on an annual banquet to be held by the Company.

NOTES AND COMMENTS.

It has been stated that the house at Herne Hill occupied by the RUSKIN family was the Casino House. JOHN RUSKIN says in "Fors Clavigera," "When I was about five years old my father found himself able to buy the lease of a house on the opposite side of the road to the Casino, and somewhat nearer to Herne Hill station, being numbered 28. Our house," he goes on to say, "was the fourth part of a group which stand accurately on the top or dome of the hill, where the ground is for a small space level, as the snows are (I understand) on the dome of Mont Blanc. The group of which our house was the quarter consisted of two precisely similar partner-couples of houses, gardens and all to match; still the two highest blocks of buildings seen from Norwood on the crest of the ridge. The house itself, three-storeyed with garrets above, commanded, in comparatively smokeless days, a very notable view from its upper windows of the Norwood Hills on one side and the winter sunrise over them, and of the valley of the Thames, with Windsor in the distance, on the other, and the summer sunset over these." In another part of the same work RUSKIN said:—"My father's house at Herne Hill—in which I correct the press of this 'Fors,' sitting in what was once my nursery—was exactly fit for him and me. He left it for the larger one, Denmark Hill, and never had a quite happy day afterwards. It was not his fault; the house at Herne Hill was built on clay, and the doctors said he was not well there; also I was his pride, and he wanted to leave me in a better house." The house at Herne Hill referred to is well described and easily recognised, having no resemblance whatever to the Casino just demolished, and it is one of very modest pretensions, that probably did not cost more than 1,200*l.* to build, although it is still apparently in good condition and inhabited. It is much smaller than the house on Denmark Hill, a short distance off, which is numbered 163, and for the last thirty years has been occupied by Mrs. DRUCE.

THE various governments of France have reserved to themselves the privilege of manufacturing tobacco and of selling wholesale foreign products which find favour with "the blest tobacco boys." The principal manufactory in Paris was the immense block of buildings on the Quai d'Orsay, near the Pont des Invalides. At one time nearly two thousand men and women were employed in it. The Government have decided on the demolition of the buildings, for so large a site in so excellent a position can be turned to more profitable account, and the removal of a colossal factory will be an advantage to that part of the Paris landscape. According to tradition, the ground at one time belonged to BEAUMARCHAIS, who converted it into a farm. That wonderfully tough and indomitable man played many parts, and as he had friends at court and a patron in a court banker, it is not unlikely that he tried to speculate in a farm for the benefit of Paris and his own profit.

THE arrangements respecting the rebuilding of the South Parade Pier at Southsea were adopted at the meeting of the Portsmouth Town Council on Tuesday. The plans are to be prepared by Mr. G. E. SMITH, of Southsea, as architect, at a commission of $3\frac{1}{2}$ per cent. on the total expenditure on reconstruction, to be reduced to 3 per cent. if the plans, specifications and details are not completely ready for the quantity surveyor within five weeks. It is rarely an architect is allowed to co-operate in structures of this kind, and it is to be hoped the designs for the Southsea Pier will be of a character which will persuade other authorities that it is advantageous to give a commission to an architect. It is estimated that the building will cost 46,845*l.* But with such work unexpected contingencies

are likely to arise. There will be a pavilion at the shore end which can be used as a concert hall or for balls. A theatre was proposed, but the Corporation prefer to have concerts only. The tea-room will be over 70 feet in length, and it is intended to spare no pains or expense to render the pier attractive. Some members proposed to obtain designs by competition, but the majority were in favour of entrusting the work to Mr. SMITH, who had already taken some pains to assist the Council.

ST. PAUL'S Episcopal Chapel in Great Portland Street, W., was erected in 1775. It was closed as a place of worship a couple of years ago. There is now a sign-board set up announcing that the building is for disposal. What is still more remarkable, a notice has been affixed to the door stating that at the next licensing sessions a music license will be applied for. As St. James's Hall has vanished in order to make room for the new hotel, it is understood that a successor to it will be erected on the site of the Episcopal Chapel. The position is not unsuitable. It is near Oxford Street and Regent Street, and the stations of the Metropolitan Railway and the "Tube" are not far distant. The promoters, it is said, will expend 200,000*l.* in erecting a building which in convenience and acoustic fitness will surpass St. James's Hall, although it may be wanting in the interesting associations connected with the older building.

As elementary education has become compulsory in this country, it would be only rational to develop the system by making technical education also compulsory. For the majority of the people in this country the latter is the more important. The High Master of the Manchester Grammar School explained an experiment by Sir WILLIAM MATHER, which demonstrates the advantages of such a course. In a school of which he is a foffeee, Sir WILLIAM has looked after the training in manual exercises of 100 boys. The results were so satisfactory, the gentlemen who shaped out the system of higher education in Wales worked upon the experience of that school. It was urged that the only remedy for the present condition of things in England was the extension of technical education, if necessary by compulsion of law.

PARKHEAD DISTRICT LIBRARY, GLASGOW.

WE publish to-day the plans of one of the district libraries with which the city of Glasgow is providing itself. Many years ago, with the advice and assistance of Mr. BARRETT, the city librarian, a scheme of public branch libraries in different parts of the city was drawn up and begun to be put in execution. Already there was a valuable central consulting library. About four years ago Mr. CARNEGIE, with his usual generosity in such matters, offered Glasgow 100,000*l.* to help on their scheme of libraries. This munificent gift was at once accepted, and has enabled the city to hasten as well as enlarge their original intentions. When the whole scheme is completed Glasgow will be one of the best, if not the best, provided city in the kingdom in the matter of public libraries. This work was got in public competition by Mr. JAMES R. RHIND, I.A., architect, Inverness. The sculpture is by Mr. KELLOCK BROWN, Glasgow.

JAMES R. RHIND, Architect.

ST. DAVIDS CATHEDRAL.*

(Continued from page 166.)

THE next period in the history of the church is marked by the construction of the present lady chapel by Bishop Martyn at some period between 1290 and 1328, the former date being that of his accession to the bishopric, the latter that of his death. Perhaps the foundation of 1302 will enable us to fix the date more exactly. The appearances at the entrance of this chapel, the seams, patchings, interruptions, &c., are most perplexing, and cannot be made intelligible by any description, but the result of repeated examinations on the spot is a belief that most probably some such small structure as was described above had at least been commenced, but that Martyn changed the design and erected the present larger structure. The masonry of the arches leading into the chapel does not belong to that of the chapel itself, the arches themselves do not form a suitable approach to the latter, and Martyn's vaulting system, as we have seen, displaced an earlier one. Hence we may infer a change of design. But there is so little change in style that we must conceive the second design to have followed almost immediately upon the first. The architecture of Martyn's chapel is well nigh identical with the later Early English work adjoining. Some details may be called Decorated, but the general feeling and character much more nearly resemble those of the preceding style, and the capitals are remarkably similar to some of those in the north chapel aisle. It may be called an example of not very advanced Transition, less advanced, like so much other work at St. Davids, than might have been expected from its date. Its style, though a little later, is not dissimilar to that of the analogous structure at Llandaff, but the two present a striking contrast in proportion, that at Llandaff being remarkably tall and slender, with narrow bays and extremely lofty windows, while the St. Davids chapel partakes of the general character of breadth and lowness which distinguishes the whole cathedral.

On the whole, this chapel, though separated by a small difference in date and style, may be considered as the conclusion of the third epoch in the history of the fabric. It was the last addition to the cathedral, and brought the ground plan within a few feet of what it is at present. Up to this time the building was continually extending its dimensions; subsequent benefactors did little more than remodel the works of their predecessors. Bishop Martyn, more truly than anyone else, may be said to have completed the existing church.

Though there is no part of the edifice which has been more altered in detail, we may still ascertain the most important features of the original design. The Decorated string still surrounds the whole interior, except where it is cut through by monuments and other palpable insertions. Traces remain of the vaulting system, as the original shafts are preserved at the four corners and the corbels (heads in helmets) of at least one vaulting arch. But the number of bays contemplated in this roof is not clear. . . . Bishop Martyn was succeeded in 1328 by Henry Gower, one of the most munificent benefactors that the church of St. Davids ever beheld, and who might almost deserve the name of the Menevian Wykeham. The alterations in the cathedral effected during his time in the complete Decorated style extend nearly throughout the whole building, and appear to have been carried on from one uniform design. The chief object at this time appears to have been to bring the aisles and chapels into a more regular and ornamental shape, and we may fairly conclude that an impulse was given in that direction by the foundation of Sir John Wogan, which bears date in 1302, but which from the terms employed appears to have a merely prospective reference, and may not have been carried into effect for a considerable time. It was at this period that the aisles both of the nave and choir, and also the chapel aisles, had their walls raised to their present height, and preparations were made for vaulting the whole. . . . It is in this south chapel aisle that the work of this date appears to the greatest advantage. . . . It must be remembered that none of these preparations for vaulting were ever carried into effect. This is indeed no unusual phenomenon, yet there is certainly something striking in so many designs for a stone roof being traced out upon the same walls and none of them ever brought to perfection. . . . The operations carried on

in the cathedral during the latter part of the fifteenth century and the commencement of the sixteenth were very extensive. They consisted chiefly in an entire renovation of the roofs throughout the main portion of the fabric. This work seems to have been carried on not indeed from an uniform design, but with something like an uniform purpose, through a long series of years. . . . There are two names which especially connect themselves with the reparations of this date, that of Owen Pole, treasurer from 1472 to 1509, and that of Edward Vaughan, bishop from 1509 to 1522. To the former is attributed the roof of the nave, and there is reason to ascribe to him that of the choir also; but whether we are to consider them as having been erected at his private expense may be very well doubted. . . . The changes of late date in the eastern chapels are constantly attributed to Bishop Vaughan, the last of that series of munificent prelates who had so often filled the chair of St. Davids, and who, just on the eve of the revolution which was to extinguish them for ever, might by his benefactions here and elsewhere be almost said to have renewed the days of Gower. We may consider him as carrying out Pole's plan for reroofing the church in a more sumptuous manner, his roofs being of stone, while those of his predecessor were of wood. . . . At the same time the lady chapel was remodelled and at last received a stone vault not only in idea but in reality. . . . The buttresses on each side, the singular turrets at the east end and the open parapet, of which only just enough remains to prove its existence, were added at this time and the present windows inserted, but beyond these changes the masonry of the southern wall appears to be still the original work of Bishop David Martyn.

The more we contemplate the changes effected in the cathedral at this time, the more we are struck by the extreme diversity of the different portions. . . . The great point at which the restorers of this age aimed was a thorough renovation of the roofs of the church, the point in which it had up to their time remained most defective. Every earlier period in the history of the fabric had witnessed the commencement of designs for the appropriate covering of the church, each of which was supplanted by others destined, like itself, never to arrive at perfection. . . . That the works of this period were not fully completed is shown by the imperfect state of the ceiling in the south aisle of the nave. . . . Bishop Vaughan, with a pardonable vanity, reserved the most perfect and sumptuous form of roof for that part of his church which was to bear his own name, and which he had himself rescued from a state apparently approaching very nearly to desecration. The roof of the lady chapel appears to have been little less sumptuous; but an inferior style of vaulting might suffice for the mere passage between the two. The walls of the nave, which could not support their own weight, were clearly inadequate to support that of a stone roof; they therefore received a wooden one of the most gorgeous character. . . .

During the latter half of the sixteenth century considerable pains, as it would seem, were taken to preserve the building from further dilapidation. The blasts of the preceding period had swept unsparingly, indeed, over the ancient fabrics of Menevia; the translation of the see, which must directly or indirectly have involved the complete ruin of the cathedral, was indeed averted, but only at the price of a ruined palace and an absent bishop. But the old church still stood erect, and in its essential features uninjured; the work of spoliation was as yet confined to its wealth and its subordinate buildings; the fabric itself was spared.

At this period the precedent set by the enormous buttresses added to the nave during Treasurer Pole's repair was followed by propping both transepts in a similar manner. To the eastern face of the south transept two large buttresses were attached, a solid one at the angle and a flying buttress between its two blank arches. At the same time a wall was run across connecting the eastern points of these buttresses with the south choir aisle, thus making an actual addition to the church. . . . In fact, the space thus gained was used as a vestry; and if it be the place alluded to in an entry of the year 1565, we may venture to date its erection a little before that year. . . . We may probably refer to this date the partial blocking of the two windows of the north choir aisle. In each case three debased lights of equal height were inserted, the heads of which did not rise above the spring of the original arches. The upper part of the old windows was completely blocked, and that the blocking is contemporaneous with the debased lights is shown by an arch of construction in the masonry at some distance above the heads of the lights. . . .

* From the *History and Antiquities of St. Davids*. Architectural History of the Cathedral, by W. S. Jones, M.A., and E. A. Freeman, M.A.

We find a record of some trifling repairs in the year 1571, and in 1573 there was at least an intention of making further restorations in the south transept, unless we assign the erection of the buttresses and the addition of the vestry to that year, which is quite possible. . . . The eventful era of the Civil War is generally regarded as that in which its eastern aisles and chapels were virtually lost to the cathedral. We are told that the lead was at this time stripped from the lady chapel and the aisles, and used to cover the church and priory house at Cardigan. . . . It is, however, asserted by Archdeacon Yardley that this spoliation took place at the Reformation.

The most important operation since the days of Edward Vaughan and Owen Pole was accomplished in the year 1793. In consequence of a letter from Bishop Horsley, a subscription was set on foot in the year 1789, which amounted altogether to 1,931*l.* 12*s.* 6*d.*, 839*l.* having been subscribed by persons who were not members of the cathedral body. Accordingly, Mr. Nash was directed to give plans for rebuilding the west front, and the plans were submitted to the criticism of the Society of Antiquaries. The result of this is the west front in its present form. To show how far the original work was interfered with, it will be desirable to give one or two extracts from the specification. After giving directions for shoring the west front and the western arches of the north and south arcades, the architect directs "foundations to be dug from the two buttresses, 10 feet below the present surface of the ground, and a foundation to be dug to the same depth for the casing of the front wall, 3 feet wide, and the whole extent of the west front." "A range of fir piles of Norway timber" were to be driven under the foundations of the buttresses and casing. Mr. Nash proceeds:—"Erect scaffolding and take down stage by stage the upper part of the west front of the cathedral, the whole extent thereof as low as the cill of the principal window. Take down one haunch of the first arch on each side the centre aisle, and one half of the small arches over them (the triforium), also one bay of the lead, flat and roof, and also of the carved ceiling and boarding over it. And plaster and whitewash the whole to correspond with the old work.

"A casing (the whole length of the west front) of the stone of the country . . . to be worked up against the old wall, as high as the cill of the principal window; the said casing to be 18 inches thick at the bottom and 6 inches at the top, the old wall being in that height 12 inches out of an upright and hanging over its base." A completely new wall was to be built up from the cill of the window.

In point of fact this plan does not seem to have been thoroughly carried out, as the western arches of the arcades are still in the condition in which they probably were before the repairs, and the whole, or nearly the whole, interior face of the west wall, probably including the rear arch of the window, seems to be in its original state.

It only remains to observe that the sums expended on this work amounted to 2,015*l.* 15*s.* 5*d.*

In the year 1811 we find the thanks of the chapter voted to Archdeacon Davies "for his zeal and attention in new paving and improving the body of the cathedral."

Five years later it was found necessary to support the roof of the passage leading to the lady chapel by heavy props, which were built for that purpose against its southern wall, with arches thrown across the south chapel aisle. Another similar buttress was run out into the middle of the lady chapel, enclosing the central pillar of the couplet which leads into it.

In compliance with an order of the chapter made in the year 1827, the chantry chapel of St. Thomas was fitted up as a chapter-house, and was first used for that purpose at the audit on July 25, 1829. In order to effect a covered communication between the chapter-house and the choir, the western bay of the north choir aisle was taken in and roofed over, though at a lower level than the original roof.

Up to this point we find no repairs extending to the strictly architectural features of the fabric. There has been nothing to deserve the name of a restoration, nothing done with any ulterior view than that of rescuing the building from further ruin, and in many instances the means taken to preserve it have, in fact, run counter to and destroyed the original architectural design. The only work of any extent, since the time of Bishop Vaughan, in which there is the slightest pretension to architecture is the greatest blot in the whole building. The first dawn of anything like a practical application of its beauties is of much more recent date, and its first-fruits appeared when the piers and arches of the

nave were cleared of their thick coating of whitewash by the care of one of the residentiary canons. To inveigh against whitewash is in these days a little trite; it is a more pleasant task to record the effects of this good work. To say nothing of the richness and delicacy of the mouldings and floriated capitals rescued by this process, upon which we have dilated sufficiently already, one of the chief beauties of the nave was then brought to light in the natural colour of the stone, at once rich and sombre, and harmonising wonderfully with the general effect of Peter de Leia's architecture. Within a very few years the same process has been partially extended to the choir; but much of the same kind remains to be done both there and in the transepts, and in the nave itself. In the transepts, in the southern one at all events, the eastern arches are turned with alternate voussours of purple and yellow stone, the effect of which is at present entirely lost.

The fitting up of the south transept in 1843-4 as a parish church made considerable changes in the arrangement of the fabric. In order to enlarge it to the requisite extent, the blank arcades in its eastern wall were opened, and the old vestry, together with the western bay of the adjoining choir aisle, taken into it, the south wall of the latter being destroyed. These processes have resulted in the transept being now furnished with a complete eastern aisle. And as the arches by which it is entered have quite the effect of pier arches, there is nothing in the original transept to suggest the idea that such has not been the case from the beginning; it requires an inspection from the other side to reveal two curious and, we may add, ingenious changes to which the appearance is owing. The next bay of the choir aisle was roofed in to form a porch and a large and rather unsightly doorway cut through its southern wall. At the same time, the original door leading from the nave was, unfortunately, blocked up.

In 1846 a small subscription was raised, which has resulted in the restoration of the rood-screen. About the same time the remains of the great north window, long blocked up, were taken out and replaced by a Decorated window from a design by Mr. Butterfield. The first window from the west in the north and south aisles respectively, the former wholly and the latter partly blocked, were filled with Decorated tracery copied from the third window of the north aisle. The southern window was restored by subscription. In 1849 the whole range of Perpendicular windows was blown in by a violent storm and their places supplied by Decorated tracery of two patterns occupying the alternate windows. And the north choir aisle has since been roofed in, a step preparatory, it is to be hoped, to opening its windows and the arcade of the presbytery.

SELSEY CHURCHES.

AN inspection of seven ancient churches and two historic towers seems to be a good day's work, even though they were all on the fertile plain known as the Selsey peninsula. This was the programme of the sixtieth autumn meeting of the Sussex Archaeological Society, says the *Sussex Daily News*, and it was resolutely carried out to the last item.

Rumboldswyke Church was the first to be visited. Mr. P. M. Johnston said he could not quote another instance in this country of a church the whole shell of which is pre-Conquest in date (possibly as early as the ninth century), and the dedication of which is almost unique. He outlined the career of St. Rumbold so far as it is known, but explained that a host of events and miracles in the legendary life of the saint rest on very doubtful authority. He appears to have been the son of a king of Scotland, and was Bishop of Dublin (775). He crossed over to the Continent, and the relics of the saint, preserved in a silver shrine at Mechlin, are still carried in procession round the town on his day, July 1. Mr. Johnston seemed to have no doubt that the walls of Rumboldswyke Church were at one time adorned with painting, telling the story of the saint's miracles, and were ignorantly destroyed when the process of scarification, misnamed restoration, took place in 1866. He gave strong reasons for holding the opinion that the walls of the church were built from the spoils of ancient Regnum, and should be assigned to an early rather than a late date in the Saxon period.

The drive to North Mundham disclosed to the party some of the prettiest and quaintest old gardens in Sussex. North Mundham Church was restored about twenty years ago, and the restoration has left an effect of newness upon

the building, but from personal examination and from what the rector (the Rev. J. C. B. Fletcher) had told him, Mr. Johnston was glad to say that the ancient features of the church had all been most conscientiously preserved. The only object that could be pointed to as belonging to an earlier date than the thirteenth century was the font—a remarkable example on account of its huge size. It is large enough for the total immersion of an adult, and is probably the largest font in Sussex. He drew attention to the beautiful Early English arcades to the nave aisles; all this fine stonework which had stood the wear and tear of nearly seven centuries, was from the famous quarries at Caen, from which enormous quantities of stone were brought over in barges, in exchange for cargoes of wheat, to build our seacoast and riverside churches. The original toolmarks are still visible on most of the stones.

Sidlesham, three miles from North Mundham, was reached soon after noon, and Mr. Johnston described the Early English church. He dwelt particularly on the details of the early thirteenth-century work. The font is a perfect and unrestored example of Early English work. It has a square Sussex marble bowl, the sides being carved with *fleurs-de-lis* (in allusion to the Blessed Virgin, patroness of the church), while the bowl rests upon angle shafts of Sussex marble, having well-moulded capitals and bases of Caen stone. It stands upon its original steps, and has evidently never been moved from its ancient position. "We have," said Mr. Johnston, "many late twelfth and early thirteenth-century fonts of this type in Sussex. They are so numerous and bear such a close resemblance to one another as to make one suspect the existence of a 'font factory' in connection with the Petworth quarries."

There are also Early English churches at Earnley and East Wittering, and these were described by Mr. Johnston. The south doorway of the nave of the latter building dates from about 1120. It has been a good deal patched, and appears to have been shortened. It resembles a blocked doorway in the south-west tower of Chichester Cathedral. The party after luncheon drove to Cockham Tower, the last relic of the episcopal palace built by Bishop Sherborne (1508-38), for the sea view. They could stand up there and get a glorious view of the Isle of Wight. There was also a deer park, but that, together with other ancient glories of Selsey, is now at the bottom of the sea. It was while the party were gathered in a lovely garden at Cockham Tower that the Rev. J. Cave-Brown gave a brief account of the history of Selsey, on which interesting subject he is writing a book which is sure to be full of valuable information. At West Wittering, the sixth church to be visited, the vicar (the Rev. G. C. Walpole) was unable to be present, and Mr. Johnston pointed out the principal features of the Transitional Norman church, with Early English portions: the remains of what is called a "confessional," an altar-tomb, in which is placed a small coffin lid (stone) of the kind known as a "boy bishop's" tomb, bearing a pastoral staff, and two very interesting tombs of late character (about 1545) to members of the Earnley family. The county of Sussex, he explained, is justly famous for its Gothic altar-tombs; they may be said to start from about 1450, and to continue down to, or even after, the reign of Queen Mary. They made a most valuable comparative study, and without putting them in any precise order of date or locality, he arranged them as follows:—At Arundel, Singleton, Trotton, Horsham, Chichester Cathedral, Petworth, Wiston, Isfield, Kingston, Sompington, Selmeiston, Hurstmonceux, Racton, West Wittering, Selsey, Rustington, Clapham, Boxgrove, Broadwater, Warminghurst and Firle.

There was a longer drive of six and a half miles from West Wittering to Appledram, where the Rev. Canon Deedes described the Early English church and Ryman's Tower. He touched on what had been done in the way of restoration, and said that probably an old apple tree on one of the parish boundaries gave its homely name to the place. He inclined to the opinion that there must have been a church at Appledram in quite early times. The treatment of the chancel was extremely like that of Bosham, and reminded him of the close connection of that church with Bosham, as a prebend of that free royal chapel or college. At the beginning of the thirteenth century a skilled architect must have been commissioned to carry out considerable structural work at Bosham, and likely enough the prebendary of Appledram (or Apuldram) resolved to have his chancel treated in the same rich style as that which had been adopted in the mother church. In the belfry is a pair of twin bells, with inscriptions in fourteenth-century Lombardic lettering, "Sancta Maria, ora pro

nobis"; "Benedicta sit Sancta Trinitas," with the initials "P.W." after each, and Canon Deedes thought there was the strongest probability that the founder of these two bells was Peter de Weston, and that their date is about 1340. The restorers of the church might have been a little more conservative, but they did their work well, and but for it time might have made some ugly ravages. The church was now a thing of beauty; so might it remain.

As to Ryman's Tower, the date commonly assigned to this building is the latter part of the fifteenth century. It is quadrangular, 45 feet high, with internal dimensions of 27 by 20 feet. The builder is supposed to have been John Ryman, of Appledram. There is a good deal of uncertainty as to why the tower was built, but, as Canon Deedes said, "the whole pile is very picturesque, especially in combination with the adjoining church." Several of the churches visited, it may be noted, were beautifully decorated for the harvest thanksgiving services.

THE EDUCATIVE MINISTRY OF ART.*

A WISE old Roman has said that "He who suits his matter to his powers will never lack eloquence." What are my powers in the matter which this exhibition indicates? I have not the genius to be an art-producer, I have not the encyclopædic knowledge enabling me to be an art critic, historian or expounder. I have not the money or the taste which will allow me to be an art connoisseur. Alas! then, the prospect of an eloquent speech is not encouraging. The only qualification for the duty entrusted to me which I possess is official rather than personal; it is my association with the university, which is, or ought to be, in touch with all that promotes education. I pray you to invest me with this association. I shall try to invest myself with it and to keep within the lines which it prescribes by speaking for a little while on art and its educative ministry.

What do we understand by art? The primary notion of art, artis, is skill in combining or working out. The term was at first applied to the ordinary pursuits of life. Gradually it was so extended as to comprehend all mental activities. And by-and-by a distinction was introduced whose trace still exists in our universities. Twice a year I touch the heads of men and women with a velvet cap and proclaim them masters "in artibus liberalibus." The liberal arts were opposed to the illiberal or sordid. They were the arts of the free man; the sordid were the arts of the slave. What we now denote by the word is arts that give freedom in the worlds of thought, that widen horizons, that train the mind whilst they inform the intellect, and are the foundation on which special professional structures are reared. The educated man first, the educated specialist second. What, from this point of view, we can transfer to art in the sense proper to this exhibition is that art implies skill in working out some idea or concept and so representing it as to interest others in what is delightful or interesting for its own sake.

The treasure house of art is nature. Three things are postulated concerning the artist—vision, imagination, manipulation: the eye to see, with the capacity of seeing into and around the object; the faculty of discerning and imagining the purer form, the ideal truth of that which is seen; and such deftness of hand as secures the representation of that which is seen and imagined. Art is thus the interpreter of nature. As it is put in two lines of Pope:—

Unerring nature still divinely bright, . . .

At once the source and seat and end of arts.

Sometimes we oppose the artificial to the natural. The artificial is that which is made by art, and legitimate art expresses the natural. Yet we identify the word frequently with the feigned, the fictitious, the false. We say of such a one that his manners are artificial, not natural. Now, this is to say that the art is bad, unworthy in the end it contemplates or the methods it adopts. For the business of art is with truth. The artist endeavours to represent nature, not as it looks to the casual observer, or as it is at some moment or under some conditions, but in its wholeness, in its permanent and essential beauty or grandeur, as it is when the ideal and the actual are in closest accord.

Is it not here that you find the indefinable something

* An address delivered by Principal Marshall Lang, Marischal College, at the opening of the exhibition of the Aberdeen Artists' Society.

which we call genius? Many a painter draws correctly; lines, proportions, symmetries are excellent; the mechanical work is well done; you recognise painstaking talent, but the chiaroscuro, the glorifying light and shade of genius is wanting. A portrait, for instance: the features of the person are reproduced; the sartorial work—clothes, drapery, &c. admirable; you have the likeness, but it is rigid and stiff; the play of the soul is not mirrored, the characteristic or ideal man is not there. So also with a landscape picture. The configuration may be good, but it is not a Turner; you miss the shimmer, the spiritual, higher element in nature. It is the power of suggesting this, of awaking and inspiring the consciousness of this, that makes you occasionally stretch out your hands to a great picture; there is that in it which stirs a dormant receptivity; you feel that it has got into you, that through it you have a new possession, a thing of beauty that is a joy for ever.

Now, the educative ministry of art is at once apparent. It educates the faculty of observation and the faculty of imagination. What men want is, strange as it may sound, a training of the power to see; to see what is, not in its grosser states and aspects, not in its mere externality, but in its purer, nobler forms; to see the essentially and everlastingly interesting and beautiful. We all wish to get out of the circumscription of our daily round, our immediate surrounding. The mind needs some relaxations, some lightening of pressures, some other worldliness than the worldliness which hems it in. Is it not in its answer to this that one feature of the ministry of art is declared? The good picture initiates us into a secret lore. It bids us not only look with the eye, but through the eye into mysteries of life and beauty in the sights and sounds with which we are familiar. Among word-painters, have not Wordsworth and Burns given us a new delight in the familiar cuckoo, the "modest crimson-tippit daisy?" Even the otherwise uninteresting mouse? I see a character in the shaggy Highland cattle that I did not see until I was acquainted with Peter Graham. Lately I was in Essex, and the neighbourhood of Dedham had a charm for me. I looked for touches of the beautiful in its nooks because it was Constable's country. Thus, the faculty of observation is stimulated, is educated by such an exhibition as this. The eyes are opened to see what would otherwise escape sight, and ideas are borne away which we can breathe into our prospects, whatever these may be, and by which "the repose of earth, sky, sea and air is vivified." This is a service to all, and all sorts and conditions, surely.

We can feel what a place for every educative influence a city such as Aberdeen is. How many in it, in the adjacent country, need to be taken out of the circuit of their narrowing cares for little whiles; need to be healthily refreshed and delighted; need to have their minds replenished with images of beauty and of truth? I do not isolate art. It has been affirmed, and with justice, that "mere art perverts taste, just as mere theology depraves religion." For to be really appreciated there must be an atmosphere in the soul of the one who studies a work of art. The mind must be educated; the character must be elevated by the love of the good and the inherently lovely; the spirit must be in tune with the infinite; there must be a certain fineness in the fibre of the being. Therefore, for the power to purify and ennoble, art depends on the reciprocal and mutual action of many forces. But seeking to provide this action, is there not a call for such a collection of works as shall bring really good pictures and sculptures within the reach of limited means, as shall give to the worker, when the day's work is over, an opportunity, with his wife or others, of companionship with the master-interpreters of the universe in which he lives, and shall stimulate and guide the exercise of the imagination? We don't sufficiently or rightly cultivate the imagination. But a man without an imagination called into exercise and supplied with good material for its development is a man with the part neglected that enables him to live "by admiration, hope and love."

My friend Mr. Murray has done an excellent service to the citizenship of Aberdeen in giving momentum to the study of art treasures. Give nobler lives and higher cares, purer, sweeter interests to men and women; exercise in wholesome ways the imagination and the taste, and you do much that tends to withdraw the mind from what is mean and vulgar and degrading, to refine the manners that make men and to beautify and dignify human life. I congratulate the Society, whose motto is "Ars et fraternitas." It has existed for nearly eighty years, but within the last few years it has not only existed but lived and flourished. This

is the twelfth exhibition within these walls. I am no judge, but those who are maintain that this exhibition is the best ever supplied by the Society. The two committees—selection and hanging (not a very pleasant word)—have bestowed pains on their task, and have secured the result of which this afternoon we are witnesses. I trust that the ensuing season will be a record season; that not only those who attend our quarter-centenary celebrations shall have the occasion of admiring what Aberdeen can provide, but that hundreds and hundreds of the toiling and weary shall be refreshed, instructed and delighted in this hall of the muses that is opened to them. I venture to anticipate—the wish is indeed father to the thought, but the thought is one that shall be fulfilled—that, year by year, the fame of our city as a centre of art will grow, its circle of influence ever widening and its harvest of benefits to the community becoming fuller and richer.

TRANSVAAL UNIVERSITY COLLEGE.

WE published last week Mr. Colclutt's award in the Transvaal competition. A correspondent of the *Rand Daily Mail*, writing on the subject, says:—Some months ago the Council of the Transvaal Technical Institute advertised the conditions for an architectural competition for proposed new buildings for a university college to be erected in Plein Square. Designs for the whole of the contemplated new buildings were required, but it is the present intention of the Council to carry out only a portion of the work to the extent of 80,000*l.*, the design for the balance of the building having to be framed with a view to a proportionate outlay. Mr. Colclutt, the president-elect of the Royal Institute of British Architects, was appointed assessor, and came over recently from London to make his award. During the last three days the designs submitted have been on view to the public, and it is satisfactory to note that a considerable number of visitors have availed themselves of the opportunity of inspecting them.

After leaving the rooms where the drawings are exhibited one is inclined to feel that the word "waste" should be writ in large capital letters over the doorway. To every thinking mind the wastefulness of the competition system must be saddening. In this particular competition twenty-nine sets of designs have been submitted, twenty-eight architects have been spending their time, brains and money for three months, and one out of the number has been successful in being placed first, and will presumably be employed to carry out a portion, only a portion, of the building. No less than 270 large sheets of drawings have been sent in; of these, 263 are useless. One wonders if the time will ever arrive when some healthier and more economical scheme will be devised whereby architects can be saved this terrible wastage and disappointment.

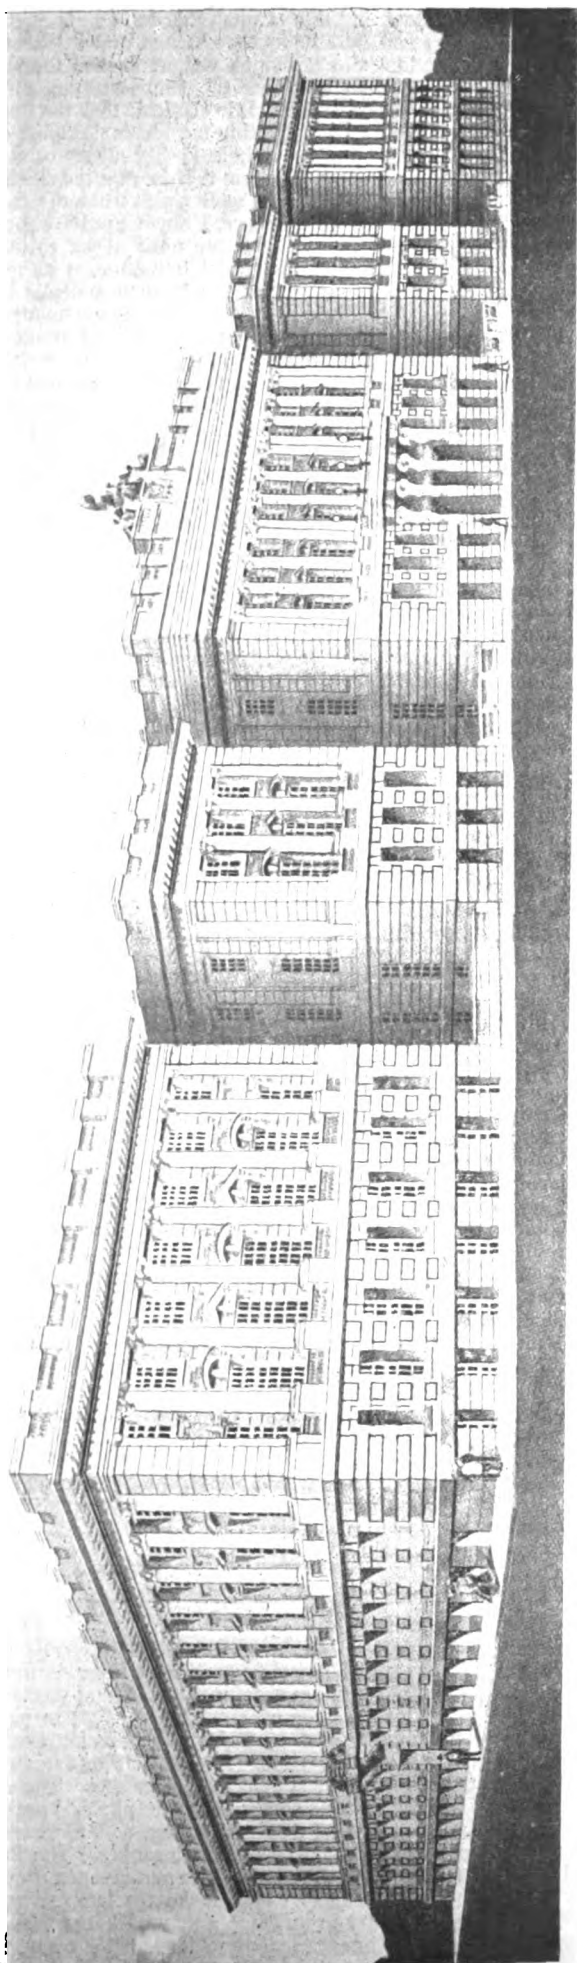

Not a single plan is wholly satisfactory, owing to the conditions which the Council of the Technical Institute laid down. The available space of 206 feet by 75 feet was graciously extended to a further 5 feet in width, making 206 feet by 80 feet. Whoever was employed by the Council to draw up such regulations is very much to blame for the necessarily unsatisfactory plans, and Mr. Colclutt in his report attributes the cramped nature of all the plans to the meagre available space laid down. Had the Council asked Mr. Colclutt to draw up the conditions, this stupid and extravagant mistake, which has crippled the designs of all the competitors, could not have happened, and it is much to be regretted that promoters of competitions do not seem to realise how indispensable it is for competent professional advice to be secured from the beginning as well as at the end of every competition.

In view of Mr. Beit's bequest to Johannesburg to found a University in quite a different neighbourhood to that of Plein Square, it is hardly credible that the complete scheme which the Council of the Technical Institute originally contemplated will ever be carried out; therefore, Mr. Howden, who is the author of the first premiated design, is to be congratulated on a plan which, more readily than any of the other designs, can be built in distinct portions which are practically complete in themselves.

The academic and dignified Classic treatment employed by Mr. Howden lends itself admirably to the preliminary portion of the scheme, and its restraint from "features" is eminently suitable to a Technical Institute.

It is only when one contemplates this same treatment being repeated throughout the building in its entirety that one does not regret the inevitable abandonment of a University in Plein Square.

DESIGNS FOR TRANSVAAL UNIVERSITY COLLEGE.
First Design by Mr. Koch and H. (C. C. P.)

Second Design by Messrs. Dickson & McCowat.

Third Design by Messrs. Stucke & Bannister, Johannesburg.

Even in the admirably drawn perspective, which might have emanated from the Ecole des Beaux-Arts—so continental is it in its careful draughtsmanship—one's eyes grow weary of endless Ionic columns and pilasters, and one looks in vain for some relief in the treatment of the main block.

The principal feature of the plan of the first portion is the parallel corridors which, although at present far too narrow, being only 5 feet in width, will doubtless be widened when additional ground is granted by the Council. There is much to admire in many of the other designs submitted and the plan of the set awarded the second premium contains many excellent features; it is a pity that the elevations are so restless and unsatisfactory. The design awarded the third place is full of admirable restraint and good detail. By recessing the top storey of the building behind the columnar treatment the authors have availed themselves of the sunlight and shadow which is such an asset in this land.

It is difficult to discover why the author of the design placed fourth merited this distinction. The draughtsmanship might be excused owing to lack of time, but the debased Renaissance style adopted by the author is so very bad that one is astonished at the assessor's decision. Possibly the plan may possess merits which do not appear on a brief examination.

The plan of the fifth premiated design seems good, but the treatment of the elevations is lumpy, whilst the main entrance is ill-considered and unhappy in every way.

The planning of the design placed sixth is not happy in its long narrow rooms, otherwise there is much which seems good in this set.

The elevations are in many respects original and pleasing. Had the unnecessary towers been omitted much would have been gained. Particularly happy is the long stretch of plain arched windows on the second storey, which are treated with refreshing restraint.

Twenty-six unpremiated designs, many of them of great merit, remain for the visitors to inspect, each the product of some three months' unremunerative toil, each a silent protest against the wastefulness of the competition system.

We now publish views of the premiated designs from the *Transvaal Leader*. According to Mr. Howden's design the new building will be a three-storeyed structure, and will have an effective space of some 12,000 square feet per floor after allowing for walls, passages, staircase, lift and lavatories for men and women students and for professors. In the basement provision will be made for mining and metallurgy. There will be a museum for both these branches. In connection with mining there will be a lecture-hall, a general laboratory, and, in addition, a laboratory for private work. On the other side provision will be made for the main metallurgical laboratory, a metallography-room, a sampling and grinding-room, a laboratory for wet work, a dark-room, a balance-room, &c. The ground floor will be devoted (*pro tem.*) to a council chamber, registrar's offices, secretary's offices, a large room for the use of technical societies and for the accommodation of the Seymour Memorial Library, a general lecture theatre, an examination-hall, a staff common-room, &c. On the first floor provision is to be made for the teaching of physics and mathematics. In addition to these, provision is made on the first floor for two commodious classrooms for the teaching of mathematics, a classroom for the teaching of the classics, another for modern languages, and yet another for English literature. The feature, however, on this side will be the classrooms for the development of evening technical classwork. There will also be a students' common-room. The second floor is given up to surveying and chemistry, and excellent provision is made for both these subjects. In connection with chemistry there are to be two laboratories—a main laboratory nearly 2,000 square feet in extent and also a laboratory for organic chemistry over 1,000 square feet in size.

WINCHESTER CATHEDRAL.

IN the latest number of the *Diocesan Chronicle* Canon Braithwaite gives the following description of the works at Winchester Cathedral:—

The first and most important work is that of underpinning the buttresses which support the north and south walls of the retro-choir, and the northern and southern portions of the east wall. The cathedral was originally built on a bed of peat, on which were laid horizontally large

trunks of beech trees in layers, the interstices being filled with chalk and flints; upon these the early English builders (A.D. 1202) laid their foundations and raised their walls. Before long the immense weight caused the walls to sink and spread, so that now the south-east corner is 20 inches out of perpendicular. It is obvious that the first need is to prevent this from continuing. This is being done in the following manner:—A hole is dug close to the foundation down to the peat; when this is reached the hole is continued under the main wall 9 feet from the front, and the timber, flints, &c., removed down to the top of the peat. There is scarcely any water until about 1½ feet or 2 feet above the top of the gravel, but as soon as this depth is reached the water fills the hole to a depth of 6 feet or 7 feet. The diver then removes the remainder of the peat, and places bags of cement concrete well grouted on the top of the gravel, which prevents the water from rising. When he has completed one layer of concrete bags he slits open the top of each bag and lays another upon it, which adheres to it; in the same manner a third layer is placed on the second, and so on. When 3 feet or 4 feet of the concrete have been put down the grouting-machine forces in liquid cement, which fills up all interstices and binds the whole into one solid rock. The water having been sealed down by the concrete, ordinary bricklayers lay courses of specially-burnt, hard bricks with cement upon a rock of so broad a base that no movement is possible.

A word as to the diver may be of interest. He is a man of great skill in his work; he holds a certificate for having been under water at a depth of 184 feet. Before the Government gave up the attempt to salve the *Montagu*, an application was made for this man, on account of his skill, to work upon the wreck; but the architect decided that it was impossible for him to be spared from the cathedral. On Saturday, August 11, Mr. Francis Fox, the eminent engineer, paid a surprise visit, himself put on the diver's dress, and went down into the holes in which work is at present in progress, in order to test the work for himself. He was more than satisfied, he said, that the work underneath was admirably executed and could not be improved.

Of course when the walls began to move the strain on the roof was tremendous, and it is no wonder that many of the ribs were pulled out of shape and that they, and the groining between them, have ceased to fulfil the office of an arch. For this reason the whole of the retro-choir is filled with scaffolding; some of the ribs and much of the groining must be taken out and rebuilt. The same has happened in the nave, where the outer walls have spread, though not to the same extent as the eastern part, and great cracks separate the groining from the wall in many places.

Neither the work in the roof of retro-choir or nave was foreseen when the appeals for help were made, and as, in addition to all this, reparation of the west front and pinnacles is imperative, it seems almost certain that more money will be needed than was at first contemplated, and that neither the diocese nor the country must hold their hands. At all costs the cathedral must be made absolutely safe, and those who have contributed or are going to contribute (that is to say, every person in the diocese) may feel perfectly happy that the work is in the ablest hands, and is being done by all concerned with the greatest interest, skill and carefulness. We are sure that the diocese will hear with thankfulness that every week a short service is held for the workmen, who respond most cordially. We would ask the prayers of all that they may be protected from accident, and may increase in the knowledge and love of God.

TESSERÆ.

Architecture and the Novel.

IN external materials architecture varies more than any other art. In part, it uses rare and precious materials, associated mainly with artistic service; in part, materials as common and as intimately associated with practical daily life as language. In materials and in structure architecture is the most objective of the arts. The average mind is at once impressed by the mere physical presence, length, height, mass of a great building, and these characteristics are also of essential artistic meaning. The labour of construction and the comparative permanence of works of architecture are facts which make the lamp of memory shine more clearly in its domain than in that of fiction. The processes of material decay, addition and restoration have no

analogies in the novel. The relation of part to whole is very different in a building and in a novel. In the former there are many details which have less artistic meaning, separately considered, than the single words in a work of fiction. Yet it is in unity of structure that the two arts may be most readily compared. The best plots in the novel have a marked architectural quality. When the mind grasps the general design of a cathedral, the effect ceases to be sensuous, and becomes one of the best examples of calm, free intellectual mastery over the senses to be found in any form of art. In all that concerns the warmth of concrete individual experience, the trivial affairs of the common heart, architecture can offer no successful rivalry to the novel. It cannot readily be associated with the emotional history of an individual artist, as every novel can be. So far as architecture serves practical purposes as a shelter from the elements, and a centre for community interests, it is connected with social life, however, in a more real manner than the novel is.

The Client's Duty.

The employer, in matters connected with outlay, should be honest and unreserved with his architect. It would be as foolish for him to hide from the architect his ability to spend a large sum as it would be to conceal from him his inability, should it exist, to spend a large amount. In one case he will miss the supply of much which would have improved his building, and made more delightful much of the supply of his wants, and in the other he will involve himself in unnecessary and unwise embarrassment. If his architect tells him honestly and clearly that his ideas and wants cannot be satisfactorily supplied for the sum of money it may be within his power without difficulty to provide for the purposes of his structure, he will do well to either abandon doing what he had proposed to himself to do, or consent to a remodelling of his views altogether. To make a great scheme and then to cut it down is almost infallibly to spoil everything. If all the conditions of the employer's case are properly made known to the architect before he commences his design, and borne in mind by him sedulously in the formation of that design, in nine cases out of ten the first mode of working out the problem will be found to be the wisest. Doubts and hesitations and partial pulling about of an architectural idea almost invariably destroy its unity, symmetry and proportion.

Mental and Actual Views.

How much more the artist's pencil is guided by his mental than by his sensorial view of certain objects has been pointed out by Mr. Hamerton, who states it as a fact that every landscape-painter represents mountains much higher than he sees them, as is shown by the comparison of his drawings either with photographs or with tracings taken by a perspective apparatus. Another departure from visual truth for the purpose of producing ideal truth is made by every artist in his pictorial representations of the perpendicular lines of a building as vertical and parallel; notwithstanding that, as projected upon his retina, they converge towards a vanishing point in the sky. This last statement has been called in question, on the ground that a perspective projection on a vertical plane shows perpendicular lines as vertical and parallel. But when we are looking at a lofty building like the west front of York Minster, we do not direct our eyes horizontally, but look towards a point some way up, so that the retinal plane becomes oblique, and what our visual picture really is under the circumstances is proved by the unerring test of photography. For in taking a picture of a lofty building the photographer tilts his camera upwards, so that the plane of the picture becomes oblique; and in every photograph thus taken the perpendiculars of the building must unmistakably converge.

Interpretation of Works of Art.

Constructive association is the foundation of imagination. A very common *modus operandi* is the realisation of a landscape, a figure or a countenance from a pictorial representation of it. Every picture must be essentially defective in some of the attributes of the original, as, for example, in the representation of the projection of objects, and all therefore that the picture can do is to suggest to the mind an idea, which it completes for itself by this constructive process, so as to form an aggregate which may or may not bear a resemblance to the original, according to the fidelity of the picture and the mode in which it acts upon the mind of the individual. Thus a mere sketch shall convey to one person a much more accurate notion of the object repre-

sented than a more finished picture shall give to another, because from practice in this kind of mental reconstruction the former recognises the true meaning of the sketch and fills it up in his "mind's eye," while the latter can see little but what is actually before his bodily vision, and interprets as a literal presentation that which was intended merely as a suggestion. And it is now generally admitted that in all the higher forms of representative art the aim should be, not to call into exercise the faculty of mere objective realisation, but to address that higher power of idealisation which invests the conception suggested by the representation with attributes more exalted than those actually possessed by the original yet not inconsistent with them. It depends, however, as much on the mind of the individual addressed as on that of the artist himself whether such conceptions shall be formed, since by those who do not possess this power the highest work of art is only appreciated in so far as it enables them to realise the object which it may represent.

Granite.

An average granite may be expected to contain from two to three-fifths parts of crystals of quartz or crystalline quartz; about the same, more or less, of felspar, also partly crystalline and chiefly in definite crystals, and the remainder (one-tenth part) of mica. But the mica may form two or three-tenths and the quartz three-fifths, or more, while the proportion of felspar, as well as the particular composition of the felspar, both vary extremely. Good ordinary granite weighs 166½ lbs. the cubic foot, and the cubic yard as nearly as possible two tons. Fourteen cubic feet to the ton is the usual estimate. Its toughness or resistance to crushing weights is very great, and is believed to vary a great deal in different samples. For practical purposes it is safe to assume that fresh unweathered granite will bear any direct crushing weight to which it can be exposed. Granite contains a certain amount of water capable of being driven off by continued exposure to a heat insufficient to produce any other change. This quantity differs much in different specimens even of the same stone, but it may be said to be represented by the "loss" in the table of analysis. It averages, therefore, about 0.8 per cent. Taken in its ordinary state, and containing this quantity of water, it is still sometimes capable of absorbing about one-fourth more (or 0.2 per cent.) when placed in water for a few hours. This quantity is, however, rather larger than could be expected of a good sample. Expressed in another way, we may say that a cubic yard, or two tons weight of granite, contains in its ordinary state something more than 3½ gallons of water, and some specimens can absorb nearly a gallon more on being placed in pure water for a short period. It is important to notice this fact, as the influence of frost on stone is in proportion to the water it takes up, and determines its durability.

Honorary Architects.

SIR,—If the "Young Practitioner" who wrote to you last week will look in any directory of charitable, philanthropic and other institutions he will find names of honorary physicians, honorary solicitors, honorary chaplains, honorary secretaries, &c. Without such men numerous excellent organisations must cease to exist. There are also honorary architects, and I have acted as one of them whenever occasion demanded. I knew I was in excellent company. Take, for instance, the lifeboat stations all round the coast. Until the time of his death my excellent friend the late Charles Henry Cooke acted as honorary architect for every one, for the only money he received from the Lifeboat Institution, as he told me, was on account of travelling expenses. Yet he was far from being a wealthy man, and he was sensitive concerning professional etiquette. I consider it is almost incumbent on architects to hold honorary offices. There is no use in concealing the fact that many people believe in architects having the "itching palm," and in consequence add to the cost of buildings in order to increase their commission. It is one of the causes by which municipal councils, regardless of additional trouble to themselves, employ their own surveyors to design buildings. In no way could it be more effectively brought home to the

public that architects are not more avaricious than other men than by showing a readiness to act on certain occasions without fees.

As to the case mentioned by your correspondent, where two would-be pillars of the church suggested his paying himself through trade discounts, if I were in his position I should have done something to the hypocrites which would have led to a summons. Generally men of that class are shrewd enough to know that the cost of the building is not diminished by such an arrangement. The "Young Practitioner" should have demonstrated that he was insulted as well as the profession, and I do not augur a successful career for him unless he displays more courage. I should like to have the account of the two members of the building committee on the transaction, and the reasons for tempting a novice.

Whether travelling expenses are accepted depends, of course, on the conditions of each case. Generally it will be found that arrangements can be made by which they are not incurred.—Your obedient servant,

AN ANCIENT FELLOW.

SIR,—In reply to your correspondent, *re* "honorary architect," I should understand the term to mean that he was to prepare plans, specification, supervision and the general routine of the work for nothing; but certainly he should not be called upon to pay his own travelling and out-of-pocket expenses. I have done work in this capacity, but then it has been in the town, where there are no travelling expenses. With regard to trade discounts, they should belong exclusively to the builder, and no gentleman of any position or repute would think of taking them, although we all know it is done and called secret commissions.—Yours faithfully,

HY. CURTIS-CARD.

10 North Street, Lewes: September 8, 1906.

SIR,—"Young Practitioner" has raised a point which is a poser, or rather two points—firstly, the position of honorary architect (a most unsatisfactory one) and a position which should be sternly refused. Why should an architect give his services for nothing? Do surgeons perform operations for nothing, and do solicitors undertake legal work for nothing? They do not; then why should a member of the architectural profession? With reference to the "customary trade discounts," has our profession fallen so low that such a question can be put? We have no doubt some undesirable members, as in all professions, but surely not so many black sheep that this question can be put in a journal of the standing and importance of *The Architect*. I trust that "Young Practitioner" will steadfastly shut his eyes to such a practice, and should he be fortunate enough to obtain proof of such grossly unprofessional behaviour that he will immediately place the matter before the Royal Institute of British Architects, who can safely be left to deal with such a question in a manner which would promptly put an end to the delinquent's professional career. I am a comparatively poor man in the profession, but am thankful to say honest, and have always held myself aloof from honorary work, and absolutely from the question of a bribe, and I can in consequence meet my clients and those who work for me in a quite independent and respected position, which I could not have obtained and retained had I mixed myself up in such transactions as suggested by your correspondent. Stick to your work, act honestly, do not give away your independence, and you, "Young Practitioner," will find that your work will be pleasant, your name will be respected, and should you prove exceptionally clever and have the opportunities denied to some of us, you may rise to the highest positions in your profession. With all apologies for taking up your space,—I am, &c.

AN OLD PRACTITIONER.

Old Maldstone.

SIR,—It is proposed to pull down the gatehouse of the old Palace under the new street improvement scheme. This is possibly the oldest piece of architecture in Maldstone, showing as it does direct evidence of Norman architecture, and such a piece of vandalism should not be permitted and every possible pressure brought to bear on the local authority. Will you, therefore, favour me by publishing this letter in your widely-read journal?—Your obedient servant,

ARCHÆOLOGIST.

GENERAL.

The Bexhill Town Council have paid the Somerset Herald the sum of 76*l.* 10*s.*, being fees on patent for a grant of arms.

Mr. William Fegson, architect, who has practised in Carlisle since 1868, died in that city on Monday last in his sixtieth year.

The Northern Architectural Association again offer to students (and associates not in practice nor yet twenty-five years of age) a first prize of books of the value of 2*l.* 2*s.* and a second prize of 1*l.* 1*s.* for the best set of drawings or testimonies of study as required by the R.I.B.A., to be submitted for their final examination. Similar prizes will also be given for the probationary work for the intermediate examination. The drawings are to be delivered not later than February 19, 1897.

Mr. William Goldstraw, building surveyor for a great many years to the Liverpool City Council, is to retire on a superannuation allowance of 366*l.* 13*s.* 4*d.* per annum.

The Government of India have decided to create an entirely new service of sanitary engineers, whose special province it will be to safeguard public health. A committee of experts has been appointed to consider the details of the scheme.

The Shanklin (Isle of Wight) District Council are about to expend 10,000*l.* for a supplementary water-supply from Chillerton.

The Glasgow Town Council have given formal approval to a draft agreement for the transfer of the municipal telephone undertaking to the Post Office authorities, who took possession on September 10. The purchase price, exclusive of loose tools and stores, which will be taken over at a valuation, is 305,000*l.* This figure entails a loss on the undertaking to the Corporation of 15,000*l.*

The Rev. John Griffiths reports in the *Western Mail* the discovery by the Rhonddda Naturalists' Society of a buried city at Gelli, Llwnypia, in the Rhonddda Valley. In the excavations made on this site flints of the finest workmanship were relatively abundant—arrow-heads (plain and barbed), lance-heads, scrapers, all fitted for some special use. The pottery, though in small pieces, presents eight or nine different patterns. Hearthstone ledges, fireplaces and large slabs, firmly planted for tables or anvils, were common features of the huts. In rude stone implements the sites, all of them, were remarkably rich. "There is now no doubt in my mind," Mr. Griffiths writes, "that the Gelli group of ruins is a prehistoric town. The sites already explored are numerous and important enough to warrant such a description. The 'drinking-cup' may be ascribed to the period between 1000 and 1880 B.C. The wheel-made pottery cannot be much earlier than our Christian era. What we expect to find at this old town is not merely evidence of one stage of culture, but a continuous history of man in the Rhonddda for about 4,000 years."

The Liverpool City Council last week adopted a report from the housing committee to the effect that, mainly on the question of inability to compete with private enterprise in the matter of cost, they could not recommend the Council to enter into competition with private enterprise in the direction suggested. The following amendment was proposed and lost:—"That the recommendation be referred back to the committee with instructions to prepare by way of experiment a scheme for building artisans and workmen's dwellings (not necessarily for the dispossessed) in the outskirts of the city, allowing more land, light and air than has been usually provided."

The Board of Works (Edinburgh) are taking active steps for the preservation of the stone circles at Stennes and Maeshowe. The stones of Stennes, the Watch Stone and the Ring of Brodgar are all being carefully examined, the fallen stones raised, and those that have sunk in the ground exposed as far as possible. In addition, the bases of such as are loose are being set in concrete in such a manner as not to interfere with the appearance of the stones. At Maeshowe a fence is to be erected to keep off wandering cattle, &c., and steps will be taken to prevent damage by the surface water percolating through to the stonework. Notices will also be erected at all the principal monuments in the district, intimating that they have been placed under the charge of H.M. Office of Works, as custodians under the Ancient Monuments Act.

The Architect.

THE WEEK.

POSSESSORS of pictures of late years often bequeath or present some of their examples to corporations. That is praiseworthy conduct and is deserving of imitation. On the other hand, a man who prizes a picture and intends to sacrifice his own pleasure by parting with it should ascertain what provisions are to be made for its preservation. In cities like Birmingham, Manchester, Liverpool, there are curators acquainted with the processes of cleaning and restoration. A work is therefore not likely to suffer while in their charge. But in other towns where it would be too expensive to appoint a curator there is no doubt that risks to the pictures are almost inevitable. At the present time in York there is a discussion on the subject. The city possesses some modern pictures known as the Burton collection. Recently they have been operated on, and the renovation is of a kind which would startle the painters of them. We can judge of that fact by one instance. There is a picture called *Scotch Drovers*, which is the work of the late RICHARD ANSDALL and Mr. FRITH. The latter recently visited the gallery, and he says of it:—"This picture has been so seriously injured by the removal of sheep and other unwarrantable liberties that I can scarcely recognise my own work." Some sheep it appears have been obliterated, others have been "improved" by removing their horns or by altering the forms of their eyes. Another picture was painted by the late G. F. WATTS, and is called *The Sentinels*. In it a beacon lamp, which the Saxons were supposed to employ, was removed and a cross substituted for it; afterwards the cross was painted out and a lamp of a novel kind introduced. A landscape by SAM BOUGH has been enriched by new foliage. The sub-committee who have been investigating the subject, and who are, we suppose, more or less responsible, have come to the conclusion that the work of renovation has been carried out in a thoroughly efficient manner, and without causing damage to the pictures as alleged, although no doubt the picture by ANSDALL and FRITH has at some time been damaged, but in their opinion not by their restorer. There may be differences in judgment about restoration as in those about the original execution. But when one of the aldermen declines to make observations through fear of an action at law, it is evident there must be irregularity somewhere. When such an incident can arise in a city like York it should be taken as a warning by the owners of pictures to be careful about the public bodies to whom they make over their treasures.

THE cathedral of Worms is one of the most interesting of the Romanesque churches of Germany. The style is sober and far superior to the vagaries of German Gothic of a later time. Although it might seem an enduring form of building, the cathedral was especially unfortunate in accidents. This has been explained by Professor HOFFMANN before the Union of German Architects and Engineers. There was a cathedral in Worms at an early date. But the existing building was commenced during the episcopate of Bishop BURKHARD, who presided in the diocese from 1000 to 1025. In 1018 the Emperor HENRY II. passed through Worms on his way to Burgundy, and although the building was incomplete it was consecrated at his desire in order that he might assist at the ceremony. Two years afterwards the choir collapsed. Other misadventures must have followed, for there was another consecration in 1110 and a third in 1181. In 1421 the north-western tower fell down. During the Thirty Years War the city suffered, and in 1689 the furniture and woodwork were carried off by the French and were used as firewood. In 1860 it was necessary to use iron

ties in order to keep the walls together, and in later years it has been necessary to employ a variety of methods to uphold the building. One proof of the weakness of the construction is seen in the rose window, which, owing to the sinking of the foundations, is now oval rather than round. The cathedral has two apses with altars, an arrangement which Lord LEIGHTON said jars on our sense of artistic propriety, especially as the choirs are raised above the floor of the nave. He considered that such a disposition could not have found general acceptance among a people whose sense of æsthetic fitness was congenital and strong.

It is hard on architects to be deprived of commissions which they consider are rightfully theirs. But the misfortune becomes aggravated when it is alleged that economy is insured by avoiding them. The Bradford architects have had an experience of that kind, and they met on Tuesday in order to protest against it. A statement has been issued from the city architect's department stating that the work done for the last five years, if done by outside architects, would have cost the city an average of 3,203*l.* a year, that the charges of the department had been 1,630*l.*, and that there had thus been a saving of 1,573*l.* a year to the public. Mr. T. C. HOPE analysed the document in order to prove that the saving was more imaginary than real. Mr. PRIESTLEY took a desponding view of the future, and Mr. FAIRBANK explained that, with a city architect, a poor law architect and an education architect as rivals, all commissions for public works were withheld from private practitioners. It was pointed out that the International Congress of Architects were unanimous in their opinion that the employment of official architects was detrimental to the progress of the art. But under present conditions any vote of the Congress is not likely to cause a revolution.

ANYONE taking an interest in English ecclesiastical remains, and who has a little money to spare, will do service by contributing to the cost of excavations at Haughmond Abbey, near Shrewsbury. The work has been commenced by Mr. HERBERT SOUTHAM, the local secretary of the Society of Antiquaries, under the supervision of Mr. HAROLD BRAKSPEAR. There must have been at least one peculiarity about the building, for the east end was 10 feet higher than the west end; but how this was arranged cannot be ascertained without further spadework. The abbey comprised church, chapter-house, frater, dormitory, infirmary, gate-house and guest-house, but hitherto there has been no correct plan to define the relative positions. Mr. BRAKSPEAR has offered to be present and direct and also to plan out all the work done. Visitors in the future would have the assistance of a trustworthy printed guide to enable them to understand the buildings of one of the most beautiful abbeys in the kingdom. The amount required is about 50*l.*

As there is no restraining influence in New York to determine the height of buildings, there is now rivalry among property owners to attain loftiness in their premises. The latest victory seems likely to be attained by the Singer Company. Having a building at the corner of Liberty Street and the Broadway which is fourteen storeys high, it has been decided to superimpose an extension which will attain a height of 612 feet 1 inch. There will then be forty-two floors. The addition will appear still higher as each side will measure 63 feet across, and the whole will be designed as a great tower. Lifts will, of course, be introduced, which will enable all the floors to be utilised. The premises will eventually have a cubic area of 6,695,000 cubic feet, and the floor area will measure 411,333 square feet, or nearly 9½ acres. The cost of the works has been estimated at 1,800,000 dols. Mr. ERNEST FLAGG, architect, has prepared the plans and several of the large contracts have been let.

ARCHÆOLOGY AND ROMANCE.

IT is generally accepted as a truism that there are fine arts and useful arts. The distinction between them is not always obvious. The greatest of all arts, unless we rank poetry with it, is architecture; and it sometimes can be considered as a combination of the fine arts and the useful arts. We need not enter here into any analysis of the differences between the two. But, generally, the useful arts are concerned only with the present and the future, and are indifferent to the past. Those who practise the fine arts, on the contrary, are disposed to give more attention to the past than to the present. Poets like TENNYSON, BROWNING and MORRIS, who have the deepest sympathy with the cares and difficulties of their contemporaries, cannot resist the captivation of olden legends, and endeavour to live in imagination among the conditions of a former age. In an exhibition of modern paintings we are sure to find illustrations of ancient incidents. Sculptors have not yet freed themselves from the sway of Classic mythology. Modern architecture at one time is Classic or Neo-Greek; at another time Gothic prevails. The Renaissance of Italy and that of France find admirers beyond those countries. When a favourable occasion occurred the styles named were superseded by the quaint style of Holland.

We must accept the inevitable, and all those variations can be considered as arising from the peculiar qualities of human nature. We see only a succession of changes around us, for, as has been demonstrated in our time, the surface of the great globe itself is not necessarily stable or independent of the law of mutation. Men would probably be more unhappy than they are if they were not in harmony with the material world and destined to play many parts during their seven ages. The arts, whether useful or fine, are intended for the service of man, and it must therefore follow that human interests should be influential in their growth and in their decline.

Owing to the defects of language that fact is not always apparent. We speak of Greek, Doric, Ionic, Italian and other styles as if they corresponded with the stones which were found in those countries, and were produced independently of men. What we should express by language is that architecture was created by Greek minds, Italian minds, Mediæval minds and so on. In reviving a style we are compelled to think of those who were originally associated with it, and building is only one kind of effort towards our imitation of them.

Everyone who is acquainted with architectural drawings knows how often figures in ancient costume and suitable to the style are introduced in designs for modern buildings which are imitations of Classic, Mediæval or Renaissance examples. In Gothic churches many clergymen abandon the robes which might be called constitutional, and assume vestments of the forms and materials which prevailed prior to the Reformation. Although the French are very sensitive to ridicule, statesmen, artists and authors used to pose as Romans at the parties in Prince JEROME'S Pompeiian villa. Eighteenth-century costume is occasionally worn by guests in some modern Queen Anne houses. It is only fitting that people should be in keeping with their surroundings, and a love of antiquity can be shown in costume as well as in buildings.

How far, when adopting surroundings and customs belonging to a past time, men and women also permit their thoughts to turn backward and to imagine themselves as belonging to a different period and a different country, is a subject for which we can have less visible evidence. Even in practical go-ahead America, if we believe EMERSON, there were many earnest people who were dissatisfied with modernity and were pining after an earlier and more romantic sort of life than was led in the new cities. That very shrewd business man, WILLIAM MORRIS, described himself as a "dreamer of dreams, born out of my due time," suggesting that, like

most men, there was a duality in his composition which he was able to turn to profitable account, but which would have brought other men to ruin. What, in fact, are histories and historical romances but means which are intended to gratify the craving to escape from the present and to put ourselves in the place of those who lived, as we suppose, amidst less prosaic conditions? It was a recognition of the importance of human influence when the late Professor BANISTER FLETCHER introduced in his "History of Architecture" a number of historical novels among the reference books which were recommended for the use of students. For it is absurd to consider columns, arches, windows, roofs and doors as if they corresponded with crystals in being independent of human faculties. To appreciate styles we must know something about the qualities of the races with whom they originated, and what functions the buildings were intended to serve. There were temples in Greece which Romans could imitate, but the Coliseum was of native growth. To consider the elements of a building by themselves is to ignore the spirit by which the style was created, and which was expressed in those forms rather than in others.

It must be admitted that in endeavouring to discover the character of a people of a past time there is great difficulty owing to the uncertainty of the evidence. This is seen in the disregard for what is called history by men for whom it has especial importance. The well-known story of the great Duke of MARLBOROUGH, stating that his knowledge of the Wars of the Roses was derived from SHAKESPEARE, is only one of several cases. Colonel ESMOND considered that HOGARTH and FIELDING should be accepted in the future time as more trustworthy than the official annalists of the eighteenth century. But the scientific spirit of our time is not disposed to accept caricatures or novels as necessarily authentic descriptions of the age in which they were produced. Sir WALTER SCOTT, for instance, had far more archæological knowledge than SHAKESPEARE; he was well acquainted with a variety of men in all conditions, and he had the training of a lawyer and of a judge. But modern archæologists and historians will not accept SCOTT'S pictures of life as correct. Some critics have said he is only valuable for his descriptions of armour and costume. But students of those special subjects maintain that nowhere is he so defective as in dealing with the garb of his characters.

An example of the hypercriticism to which romances are now subjected was afforded during a recent visit to Cumnor Hall by members of an archæological society. That ancient mansion has gained renown through SCOTT'S novel, "Kenilworth." In it he followed the tradition that AMY ROBSART, the wife of LEICESTER, was murdered in Cumnor by one of the earl's tools—Sir RICHARD VARNEY. Mr. JAMES PARKER, who was the cicerone for the occasion, said that much which SCOTT wrote on the subject was nonsense and entirely untruthful. Lord DUDLEY, who was afterwards Earl of LEICESTER, was in reality an excellent husband, who paid large sums for his wife's gowns and hats, and the death of AMY ROBSART was caused by an accident. Owing to the numerous errors, Mr. PARKER doubted whether Sir WALTER SCOTT ever visited the district. All that SCOTT could gain by a visit would be materials for a description of the mansion and of the park, which are of inferior importance compared with the tragedy. As it happened, Sir WALTER did visit Cumnor, but it does not follow that he was bound to describe the estate with the care that would be desirable in a land agent who was negotiating for its purchase. As regards the earl, he was undoubtedly one of the crafty nobles who were engaged in playing a deep game, and he therefore exposed himself to the danger of having his schemes distorted and his character darkened. SCOTT, who was a man of honour, says distinctly that LEICESTER may have been slandered. But the murder of AMY was generally believed in by the people of the sixteenth century. ASHMOLE, the antiquary, was

not a man who gave much attention to the gossip of ignorant people, and SCOTT found in his "Antiquities of Berkshire" the statement that VARNEY, after stifling or strangling AMY ROBSART, flung her down a flight of steps and broke her neck, using much violence upon her. In "The Yorkshire Tragedy," which some scholars attribute to SHAKESPEARE, one of the characters says—

The only way to charm a woman's tongue
Is, break her neck—a politician did it.

The words may have been inspired by one of the earl's enemies, but at least they express what was the opinion of the time. It may be allowed that documents discovered of late years prove that LEICESTER was not so black as he was painted, and Mr. PARKER would no doubt be able to make out a good case in favour of the ambitious noble.

The question, however, is whether SCOTT acted wrongly. He endeavoured to assume the position of an Elizabethan, and he is not to be blamed because he did not anticipate the researches which were to be undertaken some sixty years afterwards. He did not profess to write a history or a biography but a romance, and therefore he was only obliged to observe such laws as earlier writers had followed. Modern archæologists may endeavour to employ the same tests in dealing with legends as are used in identifying material objects of an older date. But SCOTT knew that all such investigations were likely to be uncertain. Although an enthusiastic archæologist himself, he more than once exercised his humour on the assumptions of infallibility to which some of his friends laid claim.

SCOTT, in his admirable "Essay on Romance," does not claim more for a romance than to be "a fictitious narrative in prose or verse, the interest of which turns upon marvellous and uncommon incidents." The word "romance" is no guide, for originally it signified one of the Latin dialects—"Frankis speech is called Romance." As far as can be made out, men in all ages endeavoured to obtain a respite from ordinary life by listening to fictitious narratives which, like the "Iliad" and the "Odyssey," may have had some connection with actualities. The simple authors of such fictions were not always able to create new characters. Just as in architecture, while people are demanding new styles, modifications of old styles have to be repeated, so in the romances old characters under new names were introduced from time to time. Hence it happens that stories and legends which at one time were supposed to have originated in certain countries and to be peculiar to them are now found to have a more remote origin, and to have travelled from the East to Western Europe. To subject romances to severe archæological tests is an abuse of strength and power like the breaking of a butterfly on a wheel. Writers of romance do not, as a rule, oppose fiction to fact. Their field is among incidents which are not clearly explained by history or tradition, and by combining the known and the imaginative they produce a consistent whole. DEFOE, as SCOTT says, rendered fiction more impressive than truth itself, and SWIFT gave plausibility to the grossest impossibilities. SCOTT also has been able to make romances so convincing as to excite the envy of professed historians. When so much can be done it is not wise to subject a romance to rules and regulations which were unknown to storytellers from primitive days.

It seems to us that there are analogies between the cramping system which would make "Kenilworth" an impossibility and much of the criticism which is applied to architecture. In our time everyone who proposes to practise as an architect is expected to be proficient in the science of mechanics and especially of statics. The syllabus of a modern art college, school or class would scare the architects not only of Greece and Rome, but of the Mediæval and Renaissance periods. Those men must have had various rules of thumb which they could turn to account.

But if their buildings were to be tested by the sublime science which was exemplified in the Tay Bridge that a sudden storm blew away as if it were a structure of cardboard, several must be condemned as departures from the laws of building. In most of them there is a great waste of material, and the masonry does not always correspond with any diagrams of forces which a novice could make out. An ancient building is in its way as inconsistent with scientific facts, as untruthful and as nonsensical as SCOTT's "Kenilworth," or the "Nibelungen-Leid," or the "Arthurian Legends." But the architects who designed the buildings were like the writers of romance. They adhered to the rules and regulations which had come down from their predecessors, and all of which had the simple object of captivating the attention or giving pleasure to those who looked at the buildings or listened to the romances. Men are not entirely scientific, and in spite of the absence of logic, their buildings are destined to survive thousands of most excellent structures which are marvels as expositions of pure science.

THE CHATEAU DE MADRID.

IT was rarely the late Mr. FERGUSSON expressed regret over a vanished building. He was so confident in his own power to improve buildings which are generally considered as masterpieces, he may have imagined that those which are only known by tradition were also imperfect. One of the exceptions to his general treatment is the Château de Madrid, which was due to FRANCIS I. To French eyes it was a wonder, although they were accustomed to gaze on many remarkable buildings. In describing some of the French Renaissance works of the sixteenth century Mr. FERGUSSON wrote:—

The palace, or château, of Madrid, in the Bois de Boulogne, at Paris, is another production of the same age, the loss of which is more to be regretted (it was destroyed in the Revolution) than that of any other building of its period. From the drawings of it which exist it seems to have been of remarkably elegant design, and to have approached more nearly to the palatial requirements of the age than almost any other. It was not very large, being only 265 feet in length by 112 feet wide, but it was four storeys in height, and divided into three nearly equal blocks by square towers at each of the angles and two in each face. Standing on a good bold basement, the two lower storeys were covered by arcades of very elegant design broken only by the towers, and variety and relief were given to the whole by the centre being recessed. The roof, though high, was far from being excessive, and the chimneys were treated as an essential part of the design. If we may judge from the testimony of those who have seen it and, more than this, from the representations that still exist, there was certainly no building for its size so palatial or to which the Transitional style was more happily applied, though it had not the picturesqueness of Fontainebleau nor the semi-feudal grandeur of Chambord. As an exterior, however, it would probably have at least been equal to the fragment of the court of the Louvre, which was in course of being erected simultaneously and almost in sight of this building, while its open arcades give it exactly that degree of shadow and relief the want of which is so much felt in the Louvre.

It is remarkable that Mr. FERGUSSON does not mention the peculiarity which rendered the Château de Madrid a novelty to Parisians. It was popularly known as the Château de Faience. This was owing to the manner in which glazed terra-cotta was employed in its construction and decoration. Probably Mr. FERGUSSON did not approve of that mode of construction, which in our time it is found to possess many advantages. PHILIBERT DELORME, when he was entrusted with the completion of the building after the death of FRANCIS I., declined to continue the enamel decoration, although he played it elsewhere. The château must therefore have wanted unity, and resembled a great many English houses, in which we find a difference between the front

and the sides. Some fragments may be found in the Sèvres and other museums, which are supposed to have formed part of the château. But it is very doubtful whether any important part survived the merciless destruction to which the structure was condemned, as if it were an enemy of the Revolution. There is one description of the building which should have interest for Englishmen, and which suggests the peculiarity which distinguished it. In 1650 JOHN EVELYN was in Paris, and on April 25 he visited the château. The following record of the impression it made on him is given in his Diary:—"I went out of towne to see Madrid, a palace so call'd, built by FRANCIS THE FIRST. 'Tis observable onely for its open manner of architecture, being much of terraces and galleries one over another to the very roofe, and for the materials, which are most of earth painted like Porcelain or Chinaware, whose colours appeare very fresh, but it is very fragile. There are whole statues and relievos of this potterie, chimney-pieces and columns both within and without. Under the chapell is a chimney in the midst of a roome parted from the Salle des Gardes. The house is fortified with a deepe ditch, and has an admirable vista towards the Bois de Boulogne and River." The palace at that time had existed for about a century and a quarter. But the colours continued to be "very fresh." As to the "fragility," if the pieces were thin, they were likely to be broken after a fall, but the word was likely to be used to suggest that faience was not considered to be as enduring as brick or marble. EVELYN said that the château was built by FRANCIS I., and was given its name in order that he might be absolved from his oath, "that he would not depart from Madrid, in which he was a prisoner in Spayne, but from whence he made his escape." That may have been the belief among foreigners at the time, but it is not supported by evidence. When FRANCIS I. was taken prisoner at the battle of Pavia in 1525, he demanded that he should be conducted to Madrid to his cousin CHARLES V. He found the emperor was not inspired by any excess of generosity. He was treated as a royal prisoner, and was so disappointed he thought of abdicating in favour of his son. At length he signed a treaty which his subjects declined to accept. The Pope released the king from his oath. When FRANCIS began to build the château it was known as the "Château du Bois de Boulogne," or more simply "Château du Bois." People imagined when they saw the enamelled exterior that it was an imitation of the Alcazar or the Alhambra. It was even believed that the prison in which the king was confined when in Spain was of a similar character. But so far as is known FRANCIS I. never desired to have a memorial of his misfortunes, and his conscience was not sufficiently scrupulous to compel him to set up a memorial which would remind him that he had broken his oath or was disloyal to CHARLES V.

The origin of the building was much more commonplace. English visitors when they take drives through the Bois de Boulogne where the palace was erected may imagine from the number of routes, avenues and alleys, which are laid out with so much skill, that the trees also were planted in modern times to give pleasure to spectators. But long ago the Bois formed a part of a genuine forest which extended beyond the suburban towns which now mark its limits. FRANCIS I. was fond of hunting there, and he wished to have a residence which would be nearer to it than the Louvre or St. Germain. There was no doubt that he was a genuine lover of the arts and artists of Italy, and he formed an Italian school which exercised a great influence in France. The king must have often heard of the success of LUCA DELLA ROBBIA in the decoration of buildings by glazed and coloured terra-cotta, and it was only what we might expect from such a patron to insist that his new villa, which Pierre GADIER designed, should exemplify the latest novelty in architectural decoration.

Some of LUCA's grand-nephews were following in his footsteps. The younger LUCA apparently confined

himself to glazed terra-cotta. But his brother GIROLAMO not only worked in clay but in marble and bronze. The latter was therefore better adapted to serve FRANCIS I., and through the agency of some Florentine merchants he was persuaded to visit France. VASARI says that he executed various works for King FRANCIS, "more particularly a palace decorated with numerous figures and other ornaments, cut in a kind of stone similar to that which we have ourselves at Volterra, but of a better quality, since it is soft while being worked and becomes indurated by time and exposure to the air." GIROLAMO laboured in other parts of France, and it is said remained in the country for about forty years. He acquired wealth as well as reputation. He invited his brother from France, but LUCA died soon after his arrival. VASARI considers that after GIROLAMO's death the methods of working in glazed terra-cotta became unknown.

FRANCIS I. died in 1547, and at that time the Château de Madrid was not completed. His successor HENRI II. was likewise favourable to the advance of art and his name is associated with an interesting class of pottery. The works are believed to have been continued under PHILIBERT DELORME, who was also engaged at Fontainebleau, the Tuileries and other palaces. HENRI II. reigned for only twelve years. The château was partly used as a hunting lodge and partly as a residence for royal favourites. But we do not learn that additional works were carried out. There is reason to suppose that the château was neglected. HENRI II. set up a menagerie in the grounds, and in the time of LOUIS XV. it was used like Hampton Court at the present time, to afford accommodation for people who had some claim on the liberality of the Sovereign.

Many of our readers may remember the engraving from ELMORE'S picture of the invention of the stocking frame. WILLIAM LEE, who was a Cambridge scholar, is represented watching his wife knitting at the time when he was happily inspired to invent a machine which would serve instead of women's fingers. Hose were then important articles of dress, for they were not concealed by other garments. The great HENRI IV., although burdened with the task of reconciling the different sects, made arrangements that the Château de Madrid should be used as a factory for the production of hose under the superintendence of LEE. He was also desirous of introducing various other industries and to reorganise French trade. But the king's assassination by RAVAILLAC put an end to projects of reform. LEE endeavoured to assert his rights, for he had brought over a great many workpeople from England. But the disturbances which followed were unfavourable to his claims. It was remarkable that in the eighteenth century one of the gentlemen who were allowed to live in the château used his apartment for weaving silk stockings. The effort to use the building for a factory must have had an ill effect on the royal residence, and for a long time it could not be said to be applied to any definite use.

Although of little or no utility, the Château de Madrid required the expenditure of money for its upkeep. LOUIS XVI. was compelled to give an order for its demolition. But it was untouched when the Revolution broke out. It was then sold to two contractors, BORNE and LEROI, for the small sum of 8,000*l.* For the lead they were able to obtain more than 6,000*l.* The sculpture in marble and wood was purchased by strangers. The temper of the time is suggested by the fact that no importance was attached to the beautiful work of GIROLAMO DELLA ROBBIA. The whole of it was sold to a paviour, and was converted into cement. Whatever might be said about some of the decoration, the walls at least could not be described as fragile. Although demolition in many forms was destined to be supreme during the French Revolution, the house-breakers of that time had to submit to many delays at the Château de Madrid. Large fires were lighted. But as gypsum must have been largely employed in the

construction the walls withstood the flames. At length they had to be taken down course by course with pick-axes. So much labour was expended on the work, it is stated that the expense of demolition exceeded the enormous prices received for the materials.

It would be strange if some attempts were not made by Frenchmen to imitate the decoration of the DELLA ROBBIAS. It was employed on mansions here and there; but they were so few in number that we must conclude that the sixteenth-century architects in France were not favourable to that class of work, although there were ancient as well as Renaissance precedents for its use. It afterwards became confined to finials and ornaments for roofs. Of late years the French potters have shown their ability to produce panelling and surface decoration in glazed materials. The discovery of the Persian frieze by M. and Mme. DIEULAFOY, which is now in the Louvre, has doubtless given an impetus to ceramic decoration, for it is a precedent of great age which is well deserving of respect.

STANTON HARCOURT.*

IT is an interesting coincidence that there should be a direct connecting link between the manor of Stanton Harcourt and that of the manor of Benham-Valence, by Newbury, now so well known as the property of the youthful Sir Richard Sutton, both manors having as their owners the important baronial family of De Camville, lords of Middleton, now the seat of Lord Jersey, Stanton having been granted by Adeliza, queen of Henry I., to her kinswoman, Millicent de Camville, whose daughter Isabel married Robert de Harcourt, while the manor of Benham-Valence, which has of late years been ignorantly associated with Beenham, near Reading, was given by Richard I. in 1189 to Richard de Camville, the founder of Combe Abbey, in Warwickshire, the seat of Lord Craven; and here we have another coincidence in the fact that the De Camvilles' manor of Benham-Valence after many alienations was purchased by the Cravens in the seventeenth century. Considering the many changes which have taken place in the ownership of landed property from time to time, it is a remarkable fact that the ancient and honourable family of Harcourt have held Stanton Harcourt for over 750 years, although the family seat is now elsewhere.

The magnificent old manor-house of Stanton was probably built about 1450, and ceased to be the residence of the Harcourts on the death of Sir Philip Harcourt, knight, in 1688. His widow sold the furniture, and early in the eighteenth century the family removed to their new house at Newnham Courtenay, which was building at the same time as Blenheim. The old house stood for many years dismantled and fell gradually into decay. At last, in 1770, it was taken down, though the great kitchen and a tower, containing a chapel and other rooms, was spared. The embattled tower is 54 feet 6 inches in height, with a stair turret at the south-west angle, rising 2 feet 9 inches above it. The great detached kitchen is on the lordly scale of Glastonbury, Christchurch and Durham, about 30 feet square, with a turret at one angle and an octagonal pointed roof, and is best described by Dr. Plot, the historian of Oxfordshire:—"It is so strangely unusual that, by way of riddle, one may truly call it either a kitchen within a chimney or a kitchen without one, for below it is nothing but a large square and octagonal above, ascending like a tower, the fires being made against the walls and the smoke climbing up them without any tunnels or disturbance to the cooks, which being stopped by a large conical roof at the top, goes out at loopholes on every side, according as the wind sets, the loopholes at the side next the wind being shut with louver boards, the adverse side open. The walls are 3 feet thick and the height to the roof 39 feet, which rises 25 feet higher. The roof is surmounted by a griffin 8 feet high, supporting a vane. Pope, in his letter to the Duke of Buckingham, likens the kitchen to the forge of Vulcan, the cave of Polyphemus and the temple of Moloch. He also graphically described the aged and desolate appearance of the house in his time, and concludes by affirming that 'its very rats are grey and praying that the roof may not fall

upon them, as they are too infirm to seek other lodgings.' He also describes one of the little rooms in the tower as walled up, 'for the ghost of Lady Kances is supposed to walk here and some prying maids of the family report that they have seen a lady in a fardingale through the keyhole; but the matter is hushed up and the servants are forbidden to talk of it.'"

The tower, good Perpendicular of Edward IV., called Pope's Tower, is in the garden, and contains the domestic chapel, with three rooms above it, the uppermost of which is called Pope's study, having been occupied by the poet during his residence here in 1716-8. The pane of red glass upon which he wrote the following inscription was taken out of its casement in this chamber, and is now preserved as a valuable relic at Nuneham:—"In the year 1718 Alexander Pope finish'd here the fifth volume of Homer." While he resided here Gay was staying with the Harcourts at Cokethorpe and frequently visited him. An interesting letter of his graphically describes the death of two horses who were here struck dead by lightning in 1718.

Stanton Harcourt has a charming old house in the village, belonging to All Souls College, locally known as the Pest House, but which was used as a resort for the members of the college at the time of any epidemic occurring at Oxford, and which in the seventeenth century was occupied by the Huntingdon family, to one of whom there is a monument in the chancel (1693). A remarkably interesting collection of armour and portions of military equipment of the Civil War period was inspected by some of the party. Here is also a curious collection of ladies' hats of the Cromwellian period, and other items of considerable rarity, of which time did not permit of a proper inspection.

This fine old property, which has been held by the Harcourt family 750 years, embraces a series of fishponds. The visitors ascended the tower and inspected the quaint and separate building which in former times served the purposes of a kitchen. It was described as being unique, and more remarkable than the famous kitchen at Glastonbury Abbey. The party next assembled at the church close by, which Mr. Keyser said was one of the most beautiful country churches in Oxfordshire. It contained a certain amount of Norman work, including two very fine doorways. The noble chancel and transepts were of the Early English period of architecture—thirteenth century. The antiquarians were, by special permission, allowed to enter the Harcourt chapel and inspect the grand old tombs and effigies which are so well and carefully preserved there. The most interesting of these were the recumbent figures of several members of the family, including one in knight's armour, by his side being his wife, who was represented as wearing on her arm the badge of the ancient Order of the Garter, this being one of only three instances known of the Order of the Garter being conferred upon a woman. Of the remaining two cases one exists at Ewelme, near Wallingford. There is also a fine full-length marble statue of Field-Marshal Earl Harcourt, who was born in 1743 and died in 1830, and a beautiful memorial to George Simon Harcourt, described as "earl, viscount and baron," born 1736. Mr. Keyser considered that the Harcourt chapel was probably built in the reign of Edward IV. The church screen, of Decorated style, no doubt dated from the fourteenth century. It appears to have been the custom in former times to affix memorial tablets on the outside walls of many parish churches, and among those outside Stanton Harcourt Church was one which was specially noticed on account of the tragic event which led to its erection. The quaint inscription on the tablet runs as follows:—

Near this place lie the bodies of

JOHN HEWET AND SARAH DREW,

an industrious young man, and a virtuous maiden of this parish, contracted in marriage, who being with many others at harvest work, were both in an instant killed by lightning on the last day of July, 1718.

Think not by rigorous judgment seized
A pair so faithful could expire
Victims so pure, Heaven saw well pleased
And snatched them in celestial fire.
Live well and fear no sudden fate
When God calls virtue to the grave.
Alike His justice soon or late
Mercy alike to kill or save.
Virtue unmoved can bear the call,
And face the flash that melts the ball.

* A paper by Mr. Walter Money, F.S.A., read at the visit of the Berks Archaeological Society, and published in the *Reading Mercury*.

Signor Rava, the new Italian Minister of Education, proposes to utilise a portion of the Castle of Sant' Angelo as a museum of mediæval Roman history.

OLD BUILDING AGREEMENTS.

ONE of the buildings associated with the career of Lord Bacon was Gorhambury House. It was not the mansion known by that name which belongs to Lord Verulam, but one erected by Sir Nicholas Bacon, the father of the philosopher, of which some remains exist. The estate was part of the possessions of the abbey of St. Albans. At the time of the Dissolution it was granted to Sir Ralph Rowlatt, citizen and goldsmith. From him it was purchased by Nicholas Bacon, who was afterwards Keeper of the Great Seal, and on it he erected a house. He also possessed York House, which stood within the grounds in that part of the Metropolis between Buckingham Street and Villiers Street, the Thames and the Strand. There Francis Bacon was born, there he lived during the time he held high office, and when after his disgrace he was commanded to surrender it he was afflicted. In his letter to the Duke of Lennox he wrote:—"York House is the house where my father died and where I first breathed, and there will I yield my last breath." Accident was too strong for Bacon, for he died after an experiment relating to what would now be called "cold storage" at Lord Arundel's house in Highgate.

Like many other impecunious men, Bacon lived in the grandest style. At Gorhambury he probably was attended by as many servants as James I., and according to all accounts they fleeced him as mercilessly as he fleeced litigants in his court. His father's house at Gorhambury was probably too small to accommodate his retinue, but it is said he found fault with the water-supply and had Verulam House erected on a site to the north-east of the house of Sir Nicholas Bacon. After the death of Lord Bacon, who was without children, the Gorhambury property passed to a great niece, who was married to Sir Harbottle Grimston, Master of the Rolls. Afterwards it came into the possession of his daughter-in-law. The lady was not of the temperament to allow any of her rights to be ignored. In 1656 Bacon's house had existed for only about half a century, but it had fallen out of repair, and Mrs. Sarah Grimston was eager that any reparation required should not be paid for out of her income.

Some of her letters to the Master of the Rolls remain, and have been printed by the Historic Manuscripts Commission. In one she says:—"For the repairs of the house, to which Mr. Bigg was bound, if he be of so sordid a spirit as to deny the repairing of a house which he lived in above three years, rent free, surely it is but just if he be forced to do that which, were he of a generous disposition, he would scorn to decline." A week afterwards Mrs. Grimston again writes:—"If your many employments will not give you the leasure to deale with Mr. Bigg, if you shall pleas, by my servant the bearer hereof, to send me up his lease, I shall take here that order with him which you intended, and with it, that you would pleas to send up all my other leases, save those two which Mr. Lowe is to make new ones by."

The Master of the Rolls evidently informed his daughter-in-law that it would not be becoming on his part to institute proceedings about so trifling an affair. Mrs. Grimston's reply is characteristic:—

"I am very willing rather to forbear it than to doe anything for my own gain which may be to your prejudice. But yet I thinke it very hard that I should bee required both to put the house in repair and keep it so, when, should it bee refered to indifferent persons, nothing would bee enjoined me more than to take care that it fall not into a worse condition then I found it; for the estate being to returne, after my death, to you and your heires, ther is not the same reason for my doing that now, which I should most willingly have done, had God spared to me my son, who after my life should have received it."

Lord Bacon's house was taken down a few years afterwards, viz. in 1663, and litigation concerning the keeping of it in repair was prevented. It could not be of imposing size, for it was returned for taxation as having only eleven hearths. The older house, erected by his father, was described as having forty-one hearths, and it was used as the family seat until 1681. Among the manuscripts which have survived to our time are some agreements dated 1672-3 relating to works at the chapel, which are interesting, as they were likely to be drawn up by the Master of the Rolls himself, who was one of the parties in each case. The first is between Sir Harbottle Grimston and Thomas Edney. The latter is "to build a new window to the chapell, containing fourteen foot wide in transome, and eighteen foot in the clear, with a pier in the middle, and

three lights in each side of the pier. The first light to be seven foot high with transome, the second six foot high, and the third five foot high, arched on the top." And the Master of the Rolls is to bring as much stone from Sopwell as is useful and necessary for doing the said work; and what is wanting over and above is to be supplied out of the stone in the barn at Gorhambury. And the said Thomas Edney is to find lime for the said work, and to let in all the iron bars fit for the glazier, and do all other freemason's work to the finishing of the said window, which is to be done and finished, before Midsummer Day next ensuing, in good and workmanlike manner. And he is to have and receive for the said work the sum of 19*l.*; that is to say, 5*l.* the first day he begins the work; and 10*l.* more when the work is half done, and 4*l.* when he has finished the said work.

The Sopwell referred to was an adjacent nunnery. On the same day another agreement was entered into with Thomas Evans, who was "to take down the end of the old chapel and to build a new wall, twenty foot in length from the old wall, and to make the foundation as thick as it was before, and from the water table to the roof a foot and a half thick; the hight and breadth within to be according to the old chapel." He is to "lath, tile and seal it," and to raise the roof next the chaplain's chamber even with the new building. Moreover, he is to build up a room for the gardener adjoining the said wall, which is to be 7 feet high from the ground and 7 feet broad and 16 feet in length, to lath and tile it, and pave it in the bottom with brick. And the said Thomas Evans is to provide all materials whatsoever for doing the aforesaid work, and to have the use of the old. And for doing and finishing all the said bricklayer's work (which is to be done before Midsummer Day next ensuing) he is to have and receive the sum of 60*l.*—that is to say, 30*l.* presently down and 30*l.* when the work is all finished.

A month afterwards there was a contract with Joseph Carter as follows:—

"To frame a new roof ye whole length and breadth of the chapel, and to put in seiling gises and brackets for a cone seiling, and to make good the gallery roof to ye chapel roof, and to find all materials belonging to ye carpenturers' work of new timber.

"To make a pair of stairs out of the passage in the gallery into the gallery in ye chapel, and also to make a timber partition to secure ye round stairs, and two new door-cases with timber and boards.

"To make a new wooden gutter the whole length of the chapel to carry ye water between ye gallery roof and chapel roof ready for the laying on the lead, and to make use of old boards.

"To frame a new roof for a shed 7 foot wide and 16 foot long on the back side of the chapel, and a door and a door case, and a window, to be done of the old materials except the door case and window.

"To cut off the landing-place going to the chapel, and to return ye rails and ballisters straight to the dining-room door, and also to put in a new door-case into ye chapel close to the great stairs.

"To make the roof going up to Mr. Tressel's chamber level and straight with the rest of the range of building with old timber.

"To new joist and board with materials, which are to come from Sopwell, and boards which are already at Gorhambury, the new room under the master's own chamber: to fill (?) the old roof where the tiles are to be taken off, and to put in two purlines, and to new set up a dormer window in the garret looking into the kitchen court with old stuff which is already at Gorhambury.

"To take down ye old roof which is now over the chapel and the ceiling-floor and the windows, and to frame a floor the breadth of the seats on both sides of ye chapel with old stuff, and to board with old boards.

"To make a new window in the chapel according as it is designed in the draught.

"And it is agreed that the Master of the Rolls do pay unto Joseph Carter the sum of 70*l.* in full for doing the several works aforesaid, and the said Joseph Carter doth acknowledge that he hath received 30*l.* in hand, in part of the said 60*l.*"

It was added that "Six pounds is to be abated out of this contract in regard he does not make the window."

A third agreement was between Sir Harbottle Grimston, Master of the Rolls, and Thomas Edney, stone-cutter, who was no doubt the same party as Thomas Edney agrees to "make and set up one window of stone in the chapel

belonging to Gorhambury in form and fashion according to the draft made thereof by Capt. Ryder, for which the said Sir Harbottle Grimston does agree to pay unto the said Thomas Ednee the sum of 10*l.*, and find stone, iron-work and the carrier of the sand." The said Ednee further agrees "to lay the floor of the said chapel with good, strong and sound Pirbeck stone, cornerwise, and to find stone, lime and all other materials whatsoever, except carriage of sand," for which he is to receive at the rate of 16*d.* a foot. A subsequent memorandum records that the window was to have been "18 foot and 20 foot," and that "now the window is to be but 14 and 16 foot."

Soon afterwards there was a further agreement between the same parties. Ednee agrees "to lay the floor of the chapel at Gorhambury with good strong sound and well-coloured white Pirbeck stone and black marble, cornerwise, well polished," at the rate of 2*s.* a foot, which "comes upon measure 443 foot." Ednee also agrees "to lay the floor of that part of the chapel where the communion table is to stand with black and white marble, well polished and glazed, cornerwise," for which he is to have 3*s.* 6*d.* a foot, and to find marble, lime and all other materials. He is also to work the step "with an ostrigal mould, [and] to polish, glaze, and lay the same with the marble steps that are at Sopwell, finding all other materials" for which he is to have 3*l.*

Finally, Ednee agrees "to take up all the defective stone of blake marble in the shell house, and new lay, in the roome thereof, blacke marble, rubbed and polished, and to new lay the paveinge before the shell house doore leadinge into the gravill walke, as well where the wood lyes as where the stone lyes. To take up the stone in the space at the end of the lowe gallery under the gallery chamber, and to square and rubb the best of that stone and new lay it, the one halfe with that stone, and the other half with blacke marble, well rubbed, as alsoe the steppes goinge in and out of the same. To make foundations of bricke to sett the two pillars upon that supports the gallery chamber, to make cleane and rubb over the stones that lye by the pillars on the syde of the sayd space, and to plaster all alonge the syde at the foote of the pillars with tarrice, and to lay two courses of old stone that shall bee left in the kitchen court from the bricke paveinge at the seller doore to the door goeing up to Mr. Martine's chamber, and one course from that doore to the bricke paveinge goeing into the brewhouse entry, and to lay whole stones in the fore court in the roome of such as are broken; he to find all stone, marble, lyme, hayre, and all other materialls to be used about that work, for which he is to have forty and three pounds."

Although the agreements were entered into, Joseph Carter, who was to execute work of the amount of 70*l.*, writes to Mr. Martin, at the Rolls, in Chancery Lane:—"We receive no orders for the going on with the chapel as yet. I well hoped to have heard on Saturday last at night. We desire to hear with what expedition you can. We are not yet hindered by it, by reason the old walls are not quite taken down; if we can hear by Tuesday next, it will be seasonable enough. The bearer hereof, Mr. Edney, and I have talked about the window in the chapel, and he says he can make it of stone which he can find out at Sopwell, and I perceive the charge of wood or stone will not differ much, if you please to acquaint the master and lady with it, since he is come so great a journey. If they please, I am very willing to remit my bargain, which is 6*l.*, out of my contract, that he may have the doing of it if the master and lady be so pleased. I hope to hear by the bearer if he return to Gorhambury, or otherwise, directly how we shall proceed."

On the death of Sir Harbottle Grimston in 1683 his younger son, Sir Samuel Grimston succeeded. He in turn died in 1700 and the property passed to his great nephew, William Luckyn, who assumed the name of Grimston, and was created a viscount in 1719. One of his first acts was to order a new staircase, as is evident from the following document:—

"Estimate for a staircase to be erected at the manor-house of Gorhambury for William Grimston, Esquire. The staircase to be erected will rise out of the south side of the hall at the upper end, next the chapel, to the floor of the dining-room above, as it now lies, viz. two flights of stairs of eight steps each and two half paces, one at the end of the first flight and the other level with the dining-room floor, where the dining-room door is to be made; all to be made of good oaken wainscoat, viz. treads, risings, rails, ballisters and brackets, and also to be wainscoated rail height with

oak and pilliasters answerable to the columns on the rail worke; the under part to be wainscoated down to the floor, as also that part of the ceiling under the upper halfe pale with the same oaken wainscoat, viz. bead worke and the pannells raised, the dining-room door to be the same with architrave on both sides carved, and shutters and linings to the two windows on the stairhead, all oaken wainscoat. The ballisters, braketts, rails and cappings of the wall worke and architraves under the stairs with the columns are to be carved. The chappell door is to be sashed with 2 inch and half stuff, from the middle rail upwards; bottom to be bead worke and pannells raised, with a deal door next the hall to slide up in the partition, and those pair of doors that are now in the chappell to be putt into the parlor partition underneath the stairs, and the steps to be made from the hall floor down to the parlor with old treds that are now at Gorhambury."

In 1775 the old house had to be shored and subsequently a new mansion was erected. On October 20, 1784, the then Viscount Grimston records in his diary:—"Took possession of our new house at Gorhambury on this day, after having been employed in building it seven years the second of last month."

VALUATION OF TECHNICAL COLLEGES.

ON Friday last a committee of the Glasgow Corporation heard appeals against the valuation of Mr. James Henry, the assessor.

Mr. Allan F. Baird, on behalf of the governors of the Glasgow and West of Scotland Technical College, asked that the institution should be entered at a nominal sum.

Mr. Henry explained that he had entered the property at 3,000*l.*, being the same rent or annual value as appeared on the roll last year. He understood there was no objection to the sum, but the governors thought the college should receive consideration, and be entered at a lower valuation than a Board school. He had valued the college on the same principle as he had valued Board schools.

Mr. Baird asked the committee to consider the relation of the college to the city. Up to this year the college was exempted from the city assessments, but the committee, in view of the new buildings, thought it was impossible to continue the exemption. So that now the governors were in a worse position than in past years. The Corporation gave two grants to the college, one of 10,000*l.* from their city funds and the other from their share of the residue grant. If the committee found it necessary to assess on the valuation now put on the buildings, then they would be in the position that the city had given with one hand what it was taking away with the other. The present valuation capitalised would more than eat out the city's grant of 10,000*l.* It might be asked if there were any similar buildings treated in the way he asked. He could not refer to any case absolutely upon all fours, but he might suggest that the committee were in the habit of treating churches and hospitals in the way he asked this institution to be treated. This was not a commercial concern. The institution was entirely for the good of the industries of the West of Scotland, and their income was spent in the payment of the large staff of teachers and professors and in meeting the other expenses of the college. The Inland Revenue authorities had recognised their claim to exceptional treatment and had remitted the Imperial taxes.

The Court upheld the valuation. The Chairman remarked that while they sympathised with the work they did not see that they could interfere in the matter. They thought the valuation moderate.

The Nominations for officers and Council for the Society of Architects, 1906-7, are as follows:—*President*, Mr. A. E. Pridmore. *Vice-Presidents*, Mr. G. E. Bond, Mr. G. A. T. Middleton and Mr. R. F. Vallance. *Councillors*, Mr. Henry Adams, Mr. J. Bartlett, Mr. B. D. Cancellor, Mr. J. B. Corby, F.S.I., Mr. J. W. Dyson, Mr. H. E. Hawker, Mr. Choltan James, Mr. W. J. Jennings, Col. F. S. Leslie, Mr. E. M. Leest, Mr. E. H. Mead, Mr. T. R. Richards, Mr. E. J. Sadgrove, Mr. Anthony Scott, Mr. W. A. Scott-Deakin, Mr. F. W. Kinneir Tarte, Mr. T. F. Tickner and Mr. Percy B. Tubbs. *Hon. Treasurer*, Mr. B. R. Tucker. *Hon. Librarian*, Mr. R. G. Base, and *Hon. Secretary*, Mr. Ellis Marsland.

NOTES AND COMMENTS.

By the death of the venerable PHILIP AUDENBRAND *L'Art* has lost one of its most valued contributors. He was the NESTOR of Parisian journalists, and it was only necessary for him to invoke his memory in order to produce delightful articles. As far back as 1842 he was one of the official reporters of the French Chambers. At that time he had gained a position on the Press, and since then he has produced, in addition to articles, a large number of novels and other examples of *belles-lettres*. Being endowed with sympathy he was the friend of all the great artists, authors and players of his time, and his souvenirs form a history of French art and literature during the latter half of the nineteenth century. Among his friends was HENRI HEINE, of whose life in Paris he has given a pathetic account. His last contribution to *L'Art* related to MARIE DORVEL, who was the original CATHERINA in VICTOR HUGO's "Angelo," and whose charm in representing it compelled Mdle. MARS to surrender her rôle of THISBE in favour of her young rival. As in his other contributions, PHILIP AUDENBRAND made the old appear as if it took place the day before. In that way he had an advantage over all his younger rivals.

SOME months back it was settled that the water-works at Portsmouth which belonged to a company should be purchased. The agreement was drawn up, and on Tuesday was presented for sealing at a meeting of the Corporation. Unexpected opposition was raised. At the end of last year there were one or two heavy storms, and in consequence the water became discoloured. The company did not take energetic measures to clear the water, and investigation showed that the required filtration might cost from 50,000*l.* to 90,000*l.* If the works were extended the cost would be about 300,000*l.* Some of the members of the Corporation who at first supported the purchase joined on Tuesday with the opposition. The result was that while eight members were in favour of the purchase, thirty-four voted against it. The affair is not altogether creditable to the Town Council. At first they were confident in their own knowledge and judgment, and the technical assistance which was necessary was not obtained, partly on the score of economy, but mainly from a belief in their own wisdom which inspired the members. There was a reaction, and the Council became alarmed about the condition of the mains which they were taking over without any examination, and they anticipated that the sources of supply would yield diminished quantities of water. It now remains to be seen whether the waterworks company will accept much lower terms, or will continue to retain the works in their hands.

CANONBURY TOWER is one of the few remains of ancient manor-houses which have survived in London. The site was probably once occupied by the country house belonging to the Priors of St. Bartholomew in Smithfield. The tower is part of a house believed to have been erected by Sir JOHN SPENCER and is said to contain over twenty rooms. The contrast between the structure and the modern houses around imparts a value to it not altogether due to its architectural importance. Canonbury Tower obtains further interest from its connection with OLIVER GOLDSMITH. In 1762 he was known as the author of the "Enquiry into Polite Learning," "The Bee," the "Citizen of the World" and the "Life of Beau Nash." He was one of NEWBURY's writers, and as the publisher lived in Canonbury Tower. GOLDSMITH went there, partly to be nearer to him and partly for the quiet of the place. It is related that he composed a "History of England" and a series of "Letters from a Nobleman to His Son" in his Islington lodging. But although the interview with JOHNSON, when he gave him the manuscript of the "Vicar of Wakefield" to read and sell, may have occurred at Canonbury, it is more likely the delightful story was written in Wine Office Court.

ON October 3 there will be an excursion of the Royal Society of Antiquaries of Ireland to Trim, in the county Meath, which is about twenty-three miles from Dublin. It is an ancient place, for an abbey was founded there in the fifth century. One of the first acts of the Norman invaders was to erect a castle in Trim, and so much importance was attached to it that all the available native forces united to besiege it. ILLUGH TYRRELL, who was in command, preferred to set the building on fire. It was afterwards rebuilt, and was the residence of King JOHN. It is believed that Prince HARRY OF LANCASTER, prior to the time when his father became king of England, was imprisoned there. In the fifteenth century a mint was set up in the castle. Sir JOHN TALBOT, who was known as the scourge of France, erected an abbey, and an ancient mansion which bears his name; for a long time it was used as a school, and there the Duke of WELLINGTON received his earliest education. THACKERAY was amazed that in one of the most wretched towns in Ireland a column should be erected in memory of the Duke. Dangan Castle, where he was born, is about four miles from Trim. The Yellow Steeple is a part of the abbey tower which has survived the destructive efforts of the Parliamentarians.

ILLUSTRATIONS.

BARRY MUNICIPAL BUILDINGS.

DESIGNS for the above proposed buildings were invited from competing architects in 1902, and the following year an award was made by Mr. T. E. COLLICUTT, P.R.I.B.A., when the accompanying design was selected.

The library portion of the building was first proceeded with, the cost being about 8,000*l.*, which was given by Mr. CARNEGIE, and the building was opened early this year by the Earl of PLYMOUTH.

The Barry Urban District Council have now resolved to proceed with the construction of the front portion of the public offices, and have accepted the tender of Mr. D. W. DAVIES, of Cardiff, amounting to 7,488*l.*, subject to the approval of the Local Government Board. The architects are Messrs. C. E. HUTCHINSON & E. HARDING PAYNE, of 29 John Street, Bedford Row, London, W.C.

NEW PARISH BUILDING, HAYLE.

PROPOSED CHURCH, CUMBERLAND.

WE illustrate this week perspective view and plan of a proposed church for a village in Cumberland. It is designed to seat 250 people. The materials are to be local stone with roofing of Westmorland green slates. The estimated cost of building is 3,000*l.*, and Mr. J. E. DIXON-SPAIN, A.R.I.B.A., of 19 Hanover Square, London, W., is the architect.

SCHOOL OF ART, HULL.

PORTLAND ROAD COUNCIL SCHOOLS, HOVE, SUSSEX.

THESE schools were opened on September 3, and are the latest of the public elementary schools established by the Hove Borough Council. They are all on one floor and occupy a prominent position in Portland Road, Hove, a wide thoroughfare on the Duke of PORTLAND's estate. The accommodation provided is for 600 children, and the schools, which need little description, as the arrangement can be seen upon the plan, claim to give for a low cost all that is necessary in construction and arrangement, including glazed brick dados with plastered inside walls, a large central hall and modern fireplaces and fittings. The building contract, which was placed in the hands of Messrs. NORMAN & BURT, of Burgess Hill, works out at less than 11*l.* per child, exclusive of the fencing and boundary walls. The architects are Messrs. CLAYTON & BLACK, of Brighton.

SCULPTURE IN THE SEVENTEENTH CENTURY.

DURING the seventeenth century in Italy moral causes operated strongly in directing attention to other studies and in forming intellectual habits opposed to those of the artist. A spirit of inquiry and of philosophical discussion came abroad in the age and turned the genius of the time to mathematics and to science. The fifteenth and sixteenth centuries had boasted their Ghibertis, Donatellos, Raphaels and Buonarrotis; the seventeenth was adorned by Galileo, Toricelli, Viviani, Cassini. Nature, as if unwilling or unable to bless the same epoch with opposite and transcendent talents, seemed to rob the arts in order to enrich philosophy. It was, however, in reality only a change in the provinces of exertion, and those powers had hitherto been exercised in the realms of taste, which were now employed on subjects not less noble or sublime. The same political causes, a similar want of patronage and preference given to other studies affected in like manner literature and poetry. Between these pursuits, indeed, and the cultivation of the fine arts there appears to be an intimate relation. The taste is the same, though differently developed, and in small States they will generally be found to have flourished and decayed simultaneously. But between the spirit of analytical inquiry, and the eagerness of discovery, which conduct to philosophic truth, and the creative genius which leads to excellence in works of imagination, the opposition is so vast that the human mind has never attained high eminence in both, in the same age, and among the same people.

The immediate successors of Michel Angelo had begun to decline from the lofty but fatal pre-eminence to which the peculiar character of his genius and labours had elevated him. A succession of undistinguished artists and of unimportant productions continued to disseminate the corruption, and connect the close of the sixteenth century with the age of Bernini. Of the names or works which mark this interval, it is unnecessary to enter into details. In every respect the purity of taste was greatly deteriorated, and that of mechanical execution formed the only department in which vigorous powers were still exhibited.

No artist ever displayed happier dispositions for excelling, or at an earlier age than Bernini. Nor were these indications of youthful talent fallacious. He was certainly endowed by nature with all those qualities requisite for becoming one of the greatest of modern sculptors. He was inspired by an ardent love of the art, animated by a noble desire of honourable distinction, and possessed unwearied activity in the pursuit of his object. Such is the organisation of genius. At twelve years of age he produced portraits which excited the astonishment of all who beheld them; at fifteen he finished his group of Æneas and Anchises; and at eighteen that of Apollo and Daphne, the wonderful execution of which still claims admiration. His facility and address in the last particular, indeed, have seldom or ever been surpassed. Under his chisel the marble seemed to assume form at a word, and he appeared to create rather than to carve the productions of his fertile skill.

But these rare endowments, these excellent requirements, from the course subsequently adopted by their possessor were rendered useless, or rather hurtful to the art, by throwing a splendour round the errors and extravagances of a capricious genius. He aspired to the reputation of an inventor, and chose rather to be considered the founder of a sect than to be placed among the chiefs of the modern school.

To Bernini the antique appeared meagre in outline, poor in composition and feeble in effect. The works of Michel Angelo he preferred to those of the ancient masters as being more forcible in their impressions, but possessing a character too severe and forbidding. He hoped to elicit a third style, exhibiting distinctive excellences of its own, and which should display greater strength and energy than the former while it surpassed the latter in suavity and grace. In pursuit of this imaginary perfection he wandered still further from simplicity and nature, introducing a taste inconsistent with the real principles of sculpture which finally extinguished art in mannerism, extravagance and exhaustion. To produce effect was now the only object of study, and every means of startling attitude—flying drapery—and forced expression were employed to strike, dazzle and surprise. Statues were composed and draped after the manner of figures in painting, and the full-flowing robes of the Bolognese school were adopted as the models which, in this respect, sculptors were to follow. Thus,

amid greater errors engrafted on those of the preceding age, Bernini, by the introduction of a style which rendered less necessary the science that had hitherto constituted a redeeming quality among the imitators of Michel Angelo, and had tended to maintain an intercourse with nature, produced a more fatal separation and hastened the downfall of taste. The powers of beautiful and facile execution possessed by him in so eminent a degree recommended or concealed the impurities of his style and reconciled those whom they could not deceive. Among artists this style was quickly and almost universally adopted, both as it was the reigning mode and as its author enjoyed during a great part of this century such dominating influence and exclusive patronage as rendered him the tyrant of art to whom all who desired employment were expected to render homage.

Among the contemporaries of Bernini who were thus generally reduced to the rank of imitators two still maintained the dignity of independent and in some respects of original minds. These were Alessandro Algardi, of Bologna, and Francis du Quesnoy, of Brussels, distinguished in Italy by the appellation of his country—Il Fiammingo.

Algardi had studied painting under the founders of the Bolognese school, and we may even discover the evidences of an acquaintance with the antique, though perverted by peculiar notions. When in advanced life he afterwards adopted the profession of a sculptor, by the better principles in which his youth had thus been trained, his style was preserved comparatively pure. If, like his compeers, he confounded the distinctive characters of sculpture and of painting, he claims the merit of at least following correct examples; while they imitated Pietro da Cortona or Luca Giordano, he selected as models the Caracci and Domenichino. The most celebrated performance of this artist, and indeed one of the most extraordinary labours of modern art, is the bas-relief which measures 25 feet by 6 feet, representing the invading Army of Attila stopped by St. Leo in its march to Rome. It is placed in St. Peter's, Rome.

The department in which the talents of Fiammingo were chiefly exercised aided perhaps in preserving his manner uncontaminated by extravagant expression or conventional forms; and as the sculptor of children he not only excelled every contemporary, but even equalled the greatest of his predecessors. Nor was he inferior in works of greater magnitude; though in these his taste was little calculated to secure the approbation of his own age, as not exhibiting sufficient indications of the grand style—as that of Bernini was then falsely termed. For this very deficiency his statue of St. Andrew, in one of the niches of the cupola, is now justly regarded as one of the best colossal figures in St. Peter's. As a model Fiammingo will be found to have selected Titian, whose pictures of children hold a middle style between those of Raphael and Correggio; not so learned, pure and correct in outline as those of the former, they owe less than similar productions of the latter to the magic though fugitive graces of shade and colouring.

Participating yet faintly in the same false principles, the two preceding artists are to be considered rather as rivals than followers of Bernini. Their style and manner are more sustained, more chastened, more severe, and they might have prevented or at least retarded the complete decline of sculpture had not their merit been eclipsed by the superior reputation or their fortunes depressed by the advantageous position of that master. By this ascendancy so fatal to art, Algardi was kept in continued obscurity and neglect, while Fiammingo to obtain employment bowed before the reigning idol, but was early poisoned by a brother jealous of his fame. The genius of Bernini thus remained paramount, maintaining its supremacy during the greater part of the seventeenth century, while the eighteenth was opened by the second generation of his actual disciples.

Rome was thus the grand centre of corruption, but what of excellence still remained was to be found there also. In Lombardy, Naples, Tuscany and all over Italy the same character prevailed, while Venice enjoyed a more barbarous perversion of its own without the merit of producing one man of genius to redeem or to extenuate error. To trace the progress of decline in each separate State, and through a succession of artists whose mediocrity offers no salient feature to the observer, would be equally tedious and nugatory.

Every age has, or imagines it possesses, its own great men, and to impartial posterity often seems to have been strangely prejudiced in this delusion. About the commencement of the eighteenth century, Camillo Rusconi, a Milanese

and scholar of Ferrata, a favourite pupil of Bernini, was the great man at Rome. This artist, though as inferior to Bernini as the latter fell beneath the Tuscan masters who preceded him, was said by his compatriots to unite the correctness and majesty of the ancients with the expression and graces of the moderns. Yet Rusconi was not destitute of talent; with sounder principles and more refined taste he might have obtained merited reputation. Nor were occasions wanting of exercising his powers, since in the twelve colossal statues of the Apostles, placed by Clement XI. on the façade of the Lateran Church, he conducted the only undertaking of importance which during this period illustrates the history of sculpture. Of these Rusconi himself executed four, in the rest he was assisted by six others, whose names will point out the principal sculptors of the time—Stephen Monnot and Le Gros each finished two, Guiseppe Mazzuoli, Francisco Maratti, Lorenzo Ottoni, Angelo Rossi each produced one statue.

In these works are displayed, redeemed only by facility of mannered invention and by audacity of mechanical execution, all the characteristic errors of this school. Grandeur of effect is sought in greatness of extent, and boldness of hand is substituted for sublimity of thought. The forms are buried in a load of drapery, disposed in immense masses, as is the practice in pictures intended to be viewed from a distance, and exactly in the manner of the favourite painters of that age. The conclusion, however, is not warranted by fact in ascribing these effects, as has been done, to the designs of Carlo Maratti. This was a style of art not derived from a new or partial source, but proceeded from a principle of exaggeration and of novelty, to be traced, as the reader is now aware, in the works of Michel Angelo, which was pursued as a leading object by Bernini, and received full development among his successors.

Rusconi and his compeers are the last artists who for nearly three-fourths of the eighteenth century merit particular notice, and the work just described may be considered as the expiring effort of Italian sculpture prior to the restoration by Canova. A crowd of artisans continued for a while to haunt the scenes of former glory, but to enumerate their names or productions could neither interest the reader nor illustrate the subject. Corruptions in taste and extravagances of composition went on increasing, but the means of displaying them offered only in detail, and, finally, the sound of the mallet was scarcely audible in a city of Italy. In the department of mere labour the chisel was still wielded in a bold and skilful manner; but this advantage rather augmented the evil, both as it came to be regarded the praise chiefly to be aimed at, and as facility was thus enjoyed of following every caprice of fancy. In the fine arts the powers of execution are the last to acquire perfection and retain excellence the longest; they survive when moral beauty, sentiment and truth have long ceased to ennoble the creations which their mastery realises.

The progress of Transalpine sculpture during the preceding period now demands our attention. In France Louis XIV. patronised the arts with munificence becoming a great monarch; and though his motives were merely political, not flowing from any innate love of elegance or refinement, their effects were equally beneficial. To create French artists he established academies, endowed professorships, proclaimed rewards, instituted honours and accomplished the object. Patronage, however, cannot introduce purity of taste nor command originality of invention; these are results of causes more universal in their operation and less extrinsic in their nature. France has ever been under the influence of that domination which Italy has always exerted in the arts, and more especially in sculpture. In the present instance this influence was most direct, and they were not the models of a purer age, the monuments of better art that guided imitation, but the works of Bernini and of his school. A similarity of circumstances also concurred to introduce in both countries the same vitiated style of sculpture. Le Brun in Paris maintained the same exclusive sway enjoyed by Bernini at Rome. Nor was this despotism of an individual master equally injurious in the respective capitals—the latter was indisputably a man of genius and a sculptor—the ascendancy of the former was not the superiority of a great mind, and his reign was yet more fatal to sculpture, tending still further to extend the supremacy which painting had acquired. Directing all public works the French sculptors were necessitated to copy his designs, composed solely in the manner of painters and without any practical knowledge of their art, or if they opposed this tyranny remained unemployed.

The merits of Gerardon, the son of a founder at Troyes, entitled him to, and ought to have secured, the success which ultimately attended his exertions, without his being forced previously to become the sycophant of Le Brun. His style of sculpture, though cold, is noble, and more correct than that of his contemporaries. His manner of design is also pure and free from glaring errors, but heavy and destitute of character, and too frequently reminds the spectator of similar productions of ancient masters. That he was the Phidias of his age, though asserted by Le Fontaine, may be disputed; but that Gerardon was a sculptor of great talent, if not of genius, must be acknowledged.

Strongly opposed to the disposition of his compatriot appears the character of "the fiery and energetic Puget," the favourite artist of native writers. His execution is bold, rapid and masterly; but in composition he is defective, in science inaccurate, and in expression without dignity. In every intellectual beauty of art his works are imperfect, presenting little of elevation, nobleness, or grace: the forms are often vulgar, and always exhibit the peculiarities of an individual model. Yet such is the vigour of mechanical detail, such the breadth and freedom of touch, that the figures appear endowed with the privileges of life and movement. In early youth Puget had studied painting under Pietro da Cortona, whose large and effective, but unlearned style, is the most remote from the rigid purity of sculpture; accordingly, its influence becomes sufficiently apparent in that of France, where, subsequently to this period, it was generally followed.

As we advance to the conclusion of the seventeenth, and especially in the early portion of the following century, French sculptors rapidly increase; and, as the occasions of exercising it were more splendid, the art seemed in better condition than in Italy. The actual condition of taste, however, was alike fallen in both countries. Of the artists who flourished during this interval, Sarrasin and Guillin preserved, in the caryatides of the Louvre, some remains of ancient propriety; Le Gros and Theodon are best known at Rome; in France, the names of Le Pautre, Desjardin, Coysevaux, Vaucleve, the two Coustous, are still remembered with honour from numerous groups and statues. These, and many others of inferior note, adorned the brief golden age of French sculpture, which, under the imbecile Louis XV., suffered a rapid decline. Bouchardon, the only artist of eminence who distinguished that reign, possessed no mean talents, but was destitute of the dignity and firmness of character requisite to enable the individual, by pursuing the dictates of his own better judgment, to oppose the caprices of reigning modes.

VICTORIA BATHS, MANCHESTER.

THE Victoria Baths cover an area of 7,395 square yards, and are situate on the north side of High Street, Chorlton-on-Medlock, with the frontage to High Street. They abut upon Curzon Street on the north side and Bax Road on the west side. The elevations are carried out with red Ruabon bricks and terra-cotta in the Renaissance style, and the whole is surmounted by a turret containing a four-dial clock and hour bell. Three entrances are provided, one to the males' first-class washbaths, swimming-bath and to the Turkish baths, another to the males' second-class washbaths and swimming-bath, and a third to the females' washbaths and swimming-bath. The internal treatment of the walls is in glazed bricks, faience, buff bricks and terra-cotta, the whole harmonising in effect and design. The large roofs are carried by steel principals, those over the administrative portion of the buildings being in timber. Glazed lanterns are provided for efficient lighting and ventilation. The floors generally are finished with terrazzo with the exception of the second-class swimming-bath and round the footbaths, which are finished with patent non-slip tiles.

The buildings are heated throughout by steam, and are lighted by electricity, with a supply of gas for cases of emergency. The whole of the hot and cold water and steam supply pipes are fixed in short sections, so that repairs can be effected with a minimum of disturbance to the working of the establishment. A complete system of electric bells and telephones is provided, by means of which there is communication from each bath-room to a disc-board in the ticket office, and from the ticket office to other parts of the building, so that in case of accident or mishap there may be no difficulty in communicating with the staff. The walls of the calorifier house and laundry are treated in a

ELEVATION.

MALES' FIRST-CLASS SWIMMING AND GALA BATH (FROM SHALLOW END).

simple design in glazed bricks, allowing the cleaning down to be done at a minimum cost. In all the details of the buildings an effort has been made to minimise the cost in repairs and renewals.

The swimming-bath is constructed of concrete with a lining of Limmer asphalt; the inside surface at the sides and ends is of glazed bricks, and the bottom is laid with special floor-tiles. The bottom is marked out for water-polo. The floors of the gangways and dressing-boxes are in terrazzo, and a total of forty-five dressing-boxes are arranged on the two sides of the bath. The divisions between these dressing-boxes are constructed of 2-inch

glazed partition bricks, with cast-iron columns, with wings for the framing.

The males' second-class bath and the females' bath are in the main constructed on similar lines to those of the first-class, but the sizes of the baths are 75 feet by 35 feet and 75 feet by 30 feet respectively. At the shallow end of the baths the bottom is level for a distance of 14 feet. This insures greater safety for the younger bathers. The floor of the gangways to the second-class bath is in patent non-slip tiles, and that of the gangway to the females' bath is in terrazzo.

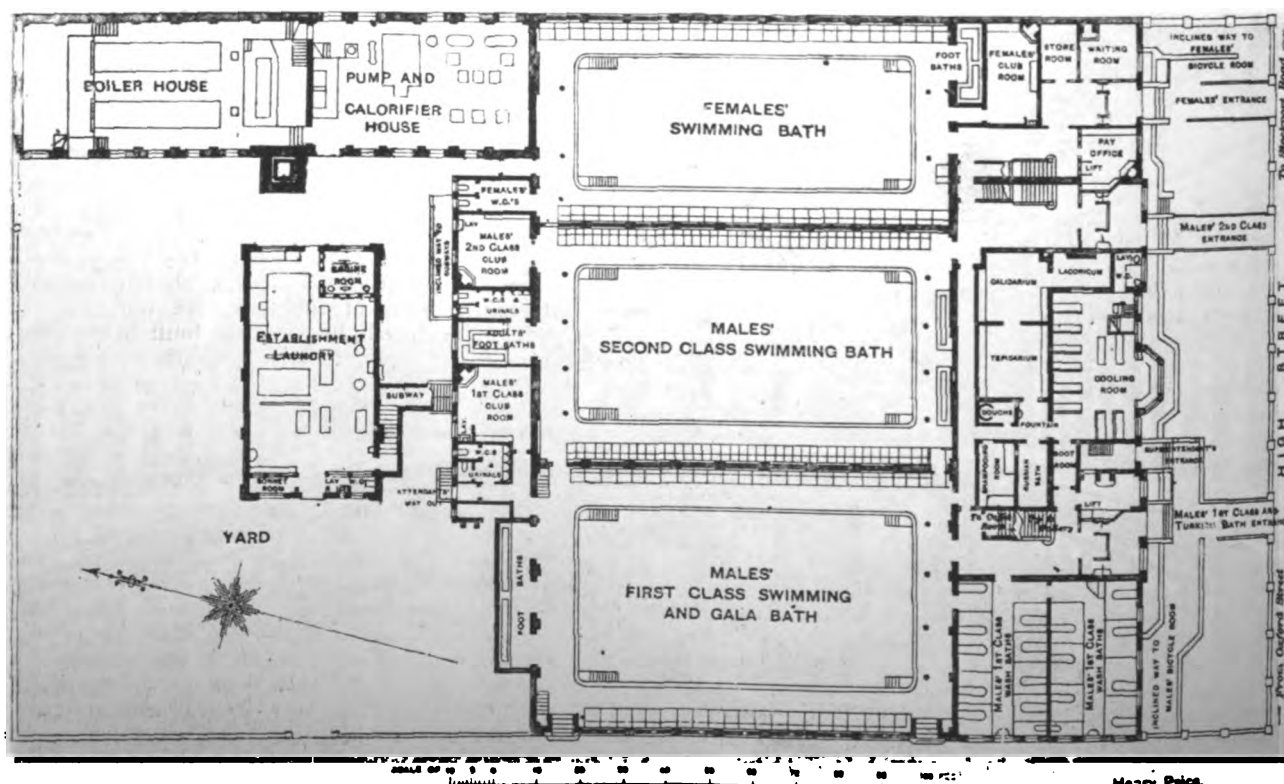

The engineering work, exclusive of laundry, consists of

a steam raising plant, deep-well air-lift pump and water storage tanks, circulating and aerating plant, calorifiers, exhaust-steam heaters and boiler-feed pumps.

The buildings have been erected by Messrs. C. H. Normanton & Son, contractors, from the designs of the city architect (Mr. Henry Price, A.R.I.B.A.). The engineering work generally has been designed and carried out under the direction of Mr. L. Holme Lewis, M.I.M.E., the waterworks committee's hydraulic engineer. The machinery and mechanical equipment of the laundry has been carried out under the direction of Mr. J. Derbyshire, general superintendent of the baths. The total cost of the buildings, street formation, sewerage, machinery and equipment amounts to 59,144*l*.

SHAP AND PENRITH.

THE members of the Cumberland and Westmorland Antiquarian and Archæological Society on Thursday in last week started on a two days tour. A detailed description is given in the *Carlisle Journal*, from which we take the following passages:—

Shap Abbey.

Walking over the crest of the hill the members came into sight of a sheltered vale through which the river Lowther pursues a winding course, and close to the river picturesquely situated was seen the tower of Shap abbey rising grey against the hill in the rear. Chief interest in the abbey ruins lies in the fact that they represent one of the few Premonstratensian abbeys in the north. The tower rising 50 or 60 feet high is a striking object. The walls, from the broken tops of which vegetation springs, are of immense thickness, and two of them are pierced by tall Gothic arches which seem to make a passage through from one side to the other. One of these arches was formerly a window, but the mullions have now disappeared. In a smaller window higher in the wall the mullions, however, are fairly complete. The Rev. J. Whiteside gave the assembly the benefit of some of his knowledge of the interesting ruins, but owing to the adverse conditions he refrained from entering upon the historic aspect of the subject, dealing mainly with the ground plan and pur-

poses of the various enclosures. One heard that the tower was comparatively recent, being built about 1485 to 1500. Nobody seems to care very much about its preservation; its condition is going from bad to worse, and there is a fear that at no distant date it may come down altogether. In the tower a niche was pointed out in which is a statue of St. Mary Magdalene. In adjusting the levels of the stones of which the building consists the monks apparently used oyster shells, and one of these shells in a perfect state which Mr. Whiteside had found some time ago was exhibited. Most of the Premonstratensian abbeys are without an aisle, but where the aisle exists it is on the north, and this is the case at Shap abbey. Cross walls which were probably employed as supports at the time the clerestory was built, the bases of columns and other objects of interest were drawn attention to, and afterwards Mr. Whiteside conducted the members of the Society over the rest of the ruins, which consist of remnants of walls varying in height from the ground level to about 10 feet. He pointed out the site of the canons' cemetery, the base of the staircase of the dormitories which extended about 76 feet in length, the cloisters, chapter-house and other interesting parts of the extensive building. The greater part of the church, he said, was built in the seventy years following 1199, and the whole length of the fabric is about 180 feet. Where now a large tree grows there used to be an arched recess, and there the founder of the abbey, Thomas, son of Gospatrick, rests. Several tombstones were drawn attention to, and pointing to an abbot's grave of stone, Mr. Whiteside said it was questionable if any man could be got into it. He had tried himself, but if he succeeded in getting in his head he could not get in his body, and if he got in his body his head was out. Canon Rawsley had made a suggestion that probably the abbots were buried and afterwards their bones were taken up and encased, and Mr. Douglas suggested that probably the bodies were embalmed and shrank in the process. The position of the doorway at the side of one of the walls of the chapter-house Mr. Whiteside said was almost the only exception to the rule of having the doorways in the centre, and from its position he concluded that the original idea in building the chapter-house had been departed from and that the intention at first was to have a lobby and chapter-house outside the main range, as at Westminster. The abbey

buildings probably extended to the south-west corner of the farm, which has for generations been in the tenancy of the Irvings, and if some 200*l.* or 300*l.* were raised excavations could be undertaken, and Mr. Whiteside believes that much could be brought to light about things which at present are hidden. The Bishop of Barrow having expressed the gratitude which all the members felt to Mr. Whiteside for his contribution to their knowledge of the place the journey was resumed.

Bampton Church and Crosses.

A paper on the church from the vicar, the Rev. G. E. F. Day, was read. The church is Georgian, and was restored very successfully not long ago by Mr. C. J. Ferguson. It is, according to the paper, an entirely modern structure, built in 1725 on the site of an older building, of the date of which there is no record. Mr. Wearing, the vicar from 1695 to 1742, has recorded that "the old church, which without any terms of art was mere rustick and had been enlarged, was about 21 yards in length and 11 in breadth (the chancel whereof was 9 yards long and 5 broad), was become so ruinous and defaced on the whole through antiquity and the disorders of the Civil Wars that it was unsafe to assemble in and incapable of being repaired." With the assistance of Dr. Gibson, then Bishop of London, a brief was procured and the new church built. In 1883 it was restored at a cost of 2,000*l.* The oak used in the pews was, as far as it went, the old remodelled, and on one of the pews is a date prior to 1726. The railing in the belfry is of various periods, and to those interested in old bells those of Bampton Church are attractive. The largest bell is said to have come from Shap abbey. A note in the churchwardens' book mentions the purchase in 1779, but does not say from whom it was obtained. The registers, the earliest of which are in a fragmentary state, date back to 1636. Miss Noble at a later stage in the afternoon explained several of the interesting objects in the church, pointing out the reredos of carved oak and inlay of holly; the cups and paten of Newcastle plate, the gift of William Noble in the memorable year 1814, and a pewter flagon dated 1806. The church also contains numerous books in raised lettering for the blind "to enable John Cookson Gill Head to join the choir and assist at the services." The font cover, an old oak cone inlaid with ebony, was examined by those with an eye to the curious. The font itself, a crude block of stone, is dated 1662. Before quitting the church, Mr. Collingwood read a paper on Bampton crosses. "There is an ancient cross now at the school; there is also a cross-base *in situ* and there are several places where crosses probably existed. Knipe Moor Cross stood until about a hundred years ago on Knipe Moor, where the site is still to be found to the north-west of the junction of the road from Knipe Hall with the road joining Low Knipe and Grange. The cross was removed and used as a gate-post at the schoolhouse; one of the arms was broken off to make it fit closer against a wall. After Miss M. E. Noble bought and rebuilt the school she had the cross placed where it now stands, against the schoolhouse wall. There is no inscription. It is not pre-Norman, but one of a series of Mediæval boundary crosses, of which not many good examples are known in our district, though elsewhere many exist. . . . Christ's Cross Gate, on the opposite side of the valley, is a name which suggests another relic of this type, and at the place where the fence of Hows Moor runs into the road below Scroggs there is the base of a cross yet remaining. Annas or Annette Cross is the name of a hill on the road below Measand." Similar names to Annette, Mr. Collingwood pointed out, occur in Annette Yat and Brow at Bampton, Annas Well at Shap, and Annetwell Street in Carlisle. The origin of the name he was not able to say, but he thought it might be connected with the Thanet Wells of the Kentigern Legend.

Thornthwaite Hall.

Leaving Bampton a short journey brought the members of the Society in view of what at first glance was an ordinary low range of farm buildings lying back some distance from the road. These buildings, known as Thornthwaite Hall, were, however, possibly the death place of the noted Belted Will, of Border fame, and on nearer examination the ancient character of the buildings becomes evident. A passage leads into the spacious courtyard, and opposite the entrance to the yard, looking somewhat modern through recent extension and the introduction of attic windows, are the buildings of principal interest. Mr. A. F. Curwen read a paper concerning the place as far as he had been able to make out, but so many of the important places were full of hay that until he had made

another examination he did not wish anything he said to be taken as final. There was no single date or armorial bearing to help in determining the date of the building, and the only way was to go back into history. In the Court of Requests there was a curious petition dated May 25, 1576, and Mr. Curwen was inclined to believe that in it is the first record of Thornthwaite Hall, viz. Sir Henry Curwen providing an estate for his son Nicholas whereon he could build for himself a home. The windows of the oldest portion of the building accord with this time, and with a little difficulty it may be possible to make out the plan as it was originally built. First of all there would be the tower, erected in imitation of the Border peles, but instead of the vaulted basement of the peles the ground floor was occupied with a chamber having a most delightful six-light mullioned window, looking out towards the south. Sir Nicholas died in the year 1604, and it was his son Sir Henry that sold Thornthwaite to Lord William Howard, probably soon after he came into the property, for they found "Belted Will" receiving the rents of and residing at Thornthwaite Hall in the year 1612. Lord William Howard used Thornthwaite as a convenient house when hunting in the neighbourhood, and to his time must be assigned the extensions consisting of a banqueting-hall nearly 35 feet in length, to which was attached a turret guard built out over a small stream. "The whole building," Mr. Curwen concludes, "has been so pulled to pieces to fit it for a farmhouse that it has now become impossible to further trace back the appearance of this at one time fine old hall of Thornthwaite."

Lowther Park was visited, and soon everybody was examining with wonder two lengths of stone which had been partially excavated, and which the name of "hogbacks" well describes.

The Lowther "Hogbacks."

According to Mr. Collingwood the hogbacks have long been in the same position to the south of the Lowther mausoleum, but it was only during the past few days that the Countess of Lonsdale had had them unearthed. Now they were able to see the pattern, and he pointed out the various features of the thinly cut designs, which indicated workmanship of the time of the Viking invasion. He did not pretend to jump to a conclusion as to the signification of the symbolism, but it was important to have found what the stone said. On the other stone was the representation of a bear scrambling up the end. If they compared it with the photograph or drawing of similar stones at Brompton in Yorkshire they would see at once that it was done by a person who had seen those stones, but could not do the bears as well as the best Brompton carver. Full of symbolism as these stones were, they could not be read thoroughly at first sight. It was a great thing to have ascertained what the details were, but it would be a still greater thing if these most interesting and curious relics could be preserved by being placed in the church. Pointing to a smaller hogback which had been unearthed and was being eaten away by the atmosphere, Mr. Collingwood asked how many people knew that it was a relic which told the story of about a thousand years ago. They were connected with the Danish rather than the Norse settlement. They tell us that the people not only in the days of the tenth century were Christians, but that they were buried in the hope of resurrection; and not only that, but that they had certain rude notions of art and methods of carving. They showed also that the people who lived in the plain between York and Darlington came to this part of the country and reproduced their art at Lowther. Mr. Collingwood concluded his remarks by again expressing a hope that the stones would be taken good care of. A pleasant drive through Lowther Park brought the party to Penrith.

A BURGH ENGINEER'S CLAIM.

THE late burgh engineer (Mr. W. Mackison) has raised an action in the Court of Session against the Dundee Town Council for the sum of 49,601*l.*, restricted to 15,000*l.*, for extra work which he alleges he performed during his term of office, which began in 1868. Official intimation of the fact was made at a meeting of the Lord Provost's committee of the Council by the town clerk, who stated that he had accepted service of the summons.

In the summons it is averred, says the *Dundee Advertiser*, that Mr. Mackison was employed by the Corporation, entirely without his duties as surveyor of police and sanitary inspector, to act as their parliamentary engineer and adviser in the preparation and carrying through of a

number of parliamentary schemes and estimates for proposed Bills, and the execution of the works under the Acts following thereon, and in various ways in connection with said proposed Bills, Acts and works. Special mention is made of the work he undertook in the reconstruction of the town under the Improvement Act of 1871, and parliamentary estimates of the Bills and cost of the works are put down as follows:—Parliamentary estimates of Bills passed, 603,334*l.*; estimates for proposed or withdrawn parliamentary schemes, 270,000*l.*; properties purchased under Improvement Acts for reconstruction and improvement of burgh, and ground feued and feu-duties sold, 600,000*l.*; tramway construction and maintenance, 220,000*l.*; engineering work, 180,000*l.*; and architectural work, 257,000*l.* His employment in carrying out the works was continuous and without interruption from shortly after his appointment as surveyor of police to the present year, and as a matter of fact, certain of the works authorised by the later measures were being carried out at the present time according to his plans. In connection with the Improvement Bill, it is averred that after it passed the then police clerk (Mr. Thomas Thornton), acting for the Commissioners, requested him to render his account. He did so, and wrote the then convener of the finance committee, giving him an unpriced statement of the work done. An offer of 100 guineas and petty expenses for his services in connection with the Bill was refused. He had meetings and correspondence with the treasurer of police and conveners of finance and improvement committees on the subject, and the late Sir Thomas Thornton from the first and all through Mr. Mackison's employment informed him that he would be paid for all work done by him for the town outside his statutory duties. In this particular Bill, while the Corporation offered him a honorarium of 100 guineas, Sir Thomas Thornton told him at the time and on several occasions afterwards that 1,000*l.* would not be too much for the pursuer's services.

Details are given regarding the work he performed in the construction of a line of tramways from the post-office to Dalhousie Terrace, which cost 13,128*l.* and was let to a private company, and for which he received 50*l.* as fees, but which he declined at the time to accept as in full payment; the Dundee Street Tramways Turnpike Roads and Police Bill, 1877-8, in connection with which he states that the Corporation, admitting their liability, requested him to make up a statement of his fees, and this he did, the statement submitted being annexed to a minute dated December 6, 1881; the Dundee Police and Improvement Consolidation Bill, 1881-2; proposals for Rope Tramways Bills from 1883 to 1890; the Dundee Street Tramways, Recreation Grounds, Police and Improvement Bill, 1886-7; the Dundee Boundaries Extension, Police Improvement and Tramways Bill, 1891-2; the Dundee Corporation Bill, 1896-7; the Dundee Corporation Tramways Bill, 1898-9; the Dundee Gas, Street Improvement and Tramways Bill, 1898-9; proposal for a cable tramway system for Constitution Road, 1898-9; and the Dundee Corporation Order, 1900-1. He not only acted as parliamentary engineer for the Bills and proposed Bills and schemes before mentioned, doing all the work usual and incident to such employment, but on the instructions of the Corporation he carried out the whole of the works required in connection with the reconstruction and improvement of the town, the construction of tramways and Esplanade extension works, and also a large number of other extensive and important engineering and architectural works, such as the erection of public markets and slaughter-houses, in reference to which it was, to begin with, contemplated advertising for competitive plans, the laying-out of Balgay Hill accesses and carriage drives, the erection of epidemic hospitals, the reconstruction of and additions to the gasworks, the erection of central and district baths, washhouses, police stations and dwelling-houses; sanitary offices, fire stations and dwelling-houses, police stables and dwelling-houses, and other works.

The whole of these works were entirely outside his duties as surveyor of police and sanitary inspector, and had he not undertaken it the town would have had to employ outside engineers and architects on the usual terms. Before Mr. Mackison was employed to perform this parliamentary work and to act as engineer and architect in other capacities it was the practice, it is pointed out, to employ outside engineers and architects. The work was, however, undertaken by Mr. Mackison, who was only earning a small salary as surveyor of police on the footing and agreement with the defenders that he was to be remunerated therefor by the defenders at the usual rates and charges, allowance

being made for office charges and expenses. The work entailed great labour, and in order that he might be able to overtake it, and at the same time give due attention to his statutory duties, he had to work almost constantly late and early and on holidays. His employment as parliamentary engineer and otherwise, as before stated, was continued without break to the present date, and this in full knowledge that he was charging fees for the work as being outside his duties as surveyor of police and sanitary inspector. Accompanying the summons was a statement giving details of the work for which Mr. Mackison charges, priced according to the recognised fees allowed to architects and engineers, and which totals 49,601*l.*, but, as already stated, the sum sued for is 15,000*l.*

Lord Provost Longair moved that appearances should be lodged, agents and counsel employed, and the action defended. Mr. J. M. Soutar seconded, and said there was no other course open to them except to defend. Mr. A. Speed suggested that an effort should be made to compromise the matter and avoid the expenditure of the rate-payers' money on litigation. Mr. G. Stevenson took the same view, but Mr. Soutar characterised such a proposal as ridiculous. Ultimately it was agreed without a division to approve of the Lord Provost's proposal.

The question of terminating Mr. Mackison's engagement as sanitary inspector, which office he held in conjunction with that of burgh engineer, at a salary, he contends, of 100*l.* per annum, was referred to at a meeting of the public health committee.

The Clerk reported that the convener and himself had interviewed the Local Government Board officials on the subject, and that they were not prepared to interfere with the local authority. Consideration of the matter was deferred.

OWEN JONES PRIZES.

THIS competition was instituted in 1878 by the Council of the Society of Arts, as trustees of the sum of 400*l.* presented to them by the committee of the Owen Jones Memorial being the balance of subscriptions to that fund upon condition of their expending the interest thereof in prizes to "students of the schools of art who, in annual competition, produce the best designs for household furniture, carpets, wall-papers and hangings, damask, chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes are awarded on the results of the annual competition of the Board of Education, South Kensington. Six prizes were offered for competition in the present year, each prize consisting of a bound copy of Owen Jones's "Principles of Design," and a bronze medal. The following is a list of the successful candidates:—Percy Bignall, School of Art and Design, Nottingham: design for a lace curtain; Mabel Eckersley, School of Art, Carlisle: design for tiles; John W. Massey, Technical School, Glossop: design for cotton prints; Stanley B. Potter, School of Art, Macclesfield: design for a woven silk hanging; John T. Shaw, School of Art, Carlisle: design for a stencilled hanging; Charles Walker, Literary and Scientific Institute, Coalbrookdale: design for tiles. The next award will be made in 1907, when six prizes will be offered for competition.

Fireproof Materials.

SIR,—Will you kindly announce in your paper that Messrs. Dixon & Heydorn, of 20 and 21 St. Dunstan's Hill, E.C., would be pleased to receive catalogues of fireproof building materials.

Thanking you in anticipation, we are, sir, yours faithfully,
DIXON & HEYDORN.

Waring & Galloway, Ltd.

SIR,—The attention of my directors has been drawn to certain malicious and unfounded attacks which have been made upon the financial position of this company. I am therefore instructed to state to those who are interested in the company that its funds are not merely ample to meet

its liabilities, but that its financial resources exceed its requirements many times over, and there is no justification whatever for the libellous statements that have been made. The volume of trade in the new premises is eminently satisfactory and far surpasses my directors' expectations.

As you have probably seen from the newspapers, proceedings have already been commenced against the proprietors and City editor of one of the London morning newspapers for libel.

My directors trust that this statement will have the effect of reassuring the debenture and shareholders as to the true position of the company.—I am, yours faithfully,

JOSEPH RITSON, Secretary.

164-180 Oxford Street, London, W. :

September 17, 1906.

GENERAL.

Mr. William B. Bryan, chief engineer to the Metropolitan Water Board, has been elected president of the Junior Institution of Engineers, in succession to Mr. Dugald Clerk.

The Joint Sub-Committee appointed by the roads and bridges and standing joint committees of the Glamorgan County Council to consider what alterations should be made in the duties and salary of the office of county surveyor reported to the last meeting of the local government committee. The committee recommended that architectural work performed by the late county surveyor be separated from the work of the roads and bridges, and the new county surveyor's duties be confined to work under the direction of the roads and bridges committee. The salary of the new county surveyor was recommended to be 600*l.* instead of 850*l.* paid to his predecessor. The suggestions were adopted, as was also a recommendation that Mr. Phillip, the deputy county surveyor, should be appointed county surveyor.

At a Meeting held recently at Middlesbrough it was decided to form a guild of lithographers, bookbinders, artists and kindred arts and crafts, with the object of improving the standard of work done, and combining the interests of both master and workman.

At the Meeting last week of the Sheffield Town Council a query in regard to the payment of 500*l.* to Mr. E. W. Mountford, professional charges in connection with the proposed alterations and additions to the town hall, was put by one of the councillors, who wanted to know whether they were not really paying this sum for nothing, whereas for 350*l.* more they could have the plans. Sir Charles Skelton replied that he was not quite sure that they could have the plans for 350*l.* more, and if they got them he was not certain that they would be of any great use to the Council, as owing to the rearrangement of the departments the enlargement of the town hall would be unnecessary for some time to come. The matter was referred back, however, for consideration.

Two Bronze Groups, each weighing two tons, representing "Industries" and "Education," have just been added to the Queen Victoria Memorial statue at St. George's Crescent, Liverpool, which is to be unveiled by the Princess Louise on the 27th inst. The central figure of the "Education" group is a likeness of Sir Oliver Lodge, formerly of Liverpool University, and now Principal of Birmingham University.

A Public Meeting will be held in the town hall, Ayr, on Tuesday next, in furtherance of the efforts being made for the preservation of the Auld Brig of Ayr, at which an address will be delivered by Lord Rosebery, K.G., K.T.

An Exhibition of a collection of works by Mr. W. Holman Hunt, O.M., D.C.L., is being organised by Messrs. Ernest Brown & Phillips with the co-operation of the artist, and it will be opened at the Leicester Galleries in October. The majority of the works, which have not been seen for over twenty years, are owned by various municipal bodies and private collectors.

The Department of Prints and Drawings in the British Museum has been enriched with a number of sketches by the late Mr. G. F. Watts, R.A. Many of the sketches are studies for some of the master's most important pictures, and from that point of view are of interest to all students and admirers of Mr. Watts's work. The collection is a gift to the nation from his widow.

The School of Art Wood-carving, South Kensington, which now occupies rooms on the top floor of the new building of the Royal School of Art Needlework in Exhibition Road, has been reopened after the usual summer vacation, and we are requested to state that some of the free studentships maintained by means of funds granted to the school by the London County Council are vacant. The day classes of the school are held from 10 to 1 and 2 to 5 on five days of the week, and from 10 to 1 on Saturdays. The evening class meets on three evenings a week and on Saturday afternoons. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager. Students connected with the wood-carving trade and professional teachers are admitted to the school at one-half the usual fees but no reduction can be made on the special fees.

A Party of London antiquaries visited the parish church of West Thurrock, Essex, on Saturday, and inspected some interesting discoveries which have been made there recently. The foundations of a circular tower of Saxon date were disclosed under the present square tower. It is 93 feet in circumference. A coffin which had been unearthed beside the stone wall, 6 feet 10 inches long, containing a skeleton, was also viewed, and it appeared that other stone coffins had been broken up and used to repair the masonry of the church.

The Royal Dublin Fusiliers' memorial committee have agreed:—"That the tender of Messrs. Lavery for the erection in Irish granite of a memorial arch at the Grafton Street entrance to St. Stephen's Green Park be accepted, and that the work be proceeded with forthwith, in accordance with the plans and specification approved by the Board of Public Works."

The Stirling Town Council on Monday considered a letter from Mr. Oldrieve, architect to H.M. Office of Works, suggesting that the Council should hand over Mars Work to the Board of Works, to be kept up under the Ancient Monuments Protection Acts, 1882 and 1901. The matter was remitted to the Provost's committee, the Provost observing that the transfer would be a considerable relief, and certainly a guarantee that in all time coming this ancient building would be kept in a satisfactory way.

Although the architect commissioned by the Office of Works to inspect Carnarvon Castle and to draw out specifications of necessary repairs has not yet presented his report, there is reason to believe, says the *Liverpool Courier*, that the Government do not contemplate an expenditure of more than about 3,000*l.* at present. Whatever money is voted will be spent upon repairs pure and simple and not upon any scheme of restoration. Modest as the sum mentioned may appear, it is exactly six times as much as the estimated value placed upon the whole building at one time in its history. Towards probably the close of the eighteenth century the Government of the day called upon a local architect to value the castle for some purpose or other, and he priced it at 500*l.*, which was almost as ludicrous as the proposal of the Corporation at a much later period to white-wash the castle walls.

The Thakeham Rural District Council, Sussex, have agreed to the following resolution:—"That the Thakeham Rural District Council are not prepared to sanction any scheme for the maining or dismaining of roads in their district of West Sussex that does not embody the maining of the old Roman road (commonly known as Stane Street), which runs in a direct line north and south through the county, and which carries an enormous amount of motor and other traffic between London and the South Coast."

The Mozambique Company announce that granite of excellent quality has been found near Beira, and is being quarried and used by the company.

The New Town Hall, which has been in course of erection at Sutton Coldfield during the past two and a half years, was opened on Wednesday. The building is the third hall the town has had. The buildings have been designed in the Georgian style, to harmonise with the existing buildings in the town, the materials used being red bricks and Monk's Park stone, with green slate roofs. The architect is Mr. Arthur R. Mayston, A.R.I.B.A., Great James Street, London, W.C. The total cost is between 11,500*l.* and 12,000*l.*

The Restoration of Holyrood Palace, Edinburgh, is approaching completion, and several alterations have been made. Queen Mary's audience chamber has been transformed by the removal of the partition.

The Architect.

THE WEEK.

THE retirement of Mr. R. PHENÉ SPIERS from the master's office in the architectural school of the Royal Academy is an event in the history of that institution. He was the first holder of the office, and as such had the principal part in the organisation of the architectural school. It is doubtful whether any one of the masters in the other schools has held office for so long a period. It would be difficult to estimate his success. The address which was presented last year in connection with the SPIERS testimonial acknowledged the help which the master had given, his kindness, constant sympathy and interest in the students' exercises and in their subsequent work. It was not to be expected that the Academy school for architecture could rival the provisions for teaching the art available in the French and other foreign schools. The Academy was from the first almost monopolised by painters; then came sculptors, and architecture may be said to have had to shift for itself. That with so many restrictions Mr. SPIERS was able to inspire the students with high aims and to encourage them to strenuous efforts tells much for his ability as a teacher. The school may hereafter have a wider scope, but it is doubtful whether any teacher will be better adapted than Mr. SPIERS for the position of master.

AN Act was passed in the reign of HENRY VIII. by which four justices were to determine the amount to be paid for the repairs of bridges and the highways within 300 feet. If there was any doubt about the precinct that was liable the work was to be done by the county, riding or corporation. If there were two precincts the inhabitants were to repair their respective parts. In the parish of Mattersey, in the county of Nottingham, there is a dispute concerning the reparation of the bridge, which it would be an advantage if four justices, as in the time of HENRY VIII., would determine. The bridge is supposed to have been in existence in 1610. An award dated 1773 declares that the bridge should be kept in repair and widened at the cost of certain proprietors in the parish and their successors. Whether any repairs were then undertaken is not known, but it is certain that the bridge was not made any wider, and it is believed that any repairs to the structure and roadway have always been carried out by the highway authority for the time being. The bridge is on a district road, and until 1903 was under the charge of the Retford Rural District Council. The District Council then informed the County Council that they would not continue to keep in repair the bridge or roadway. Their act was the result of a decision of Mr. Justice BUCKLEY, that where a bridge was erected before 1803 the liability to repair it (which included the roadway) rests with the county, unless it can be shown that others are bound to repair it. The County Council repudiated all liability. According to the award of 1773 the obligation rests on the parish of Mattersey. But that seems inequitable, because the bridge is partly in the parish of Everton. As the bridge is the only means of crossing the river Idle between Retford and Bawtry, the present deadlock not only causes inconvenience, but may lead to danger. As a way out of the difficulty it is proposed to raise funds by subscription in the district to enable the repairs of the bridge and roadway to be carried out. Afterwards the County Council might be induced to take over both. There are not many old bridges surviving in England, and it is to be regretted that the responsibility for them should be so uncertain.

THE late M. FALGUIÈRE at his own cost modelled a large group of the French Republic, standing in a chariot drawn by several horses, as an experiment to

determine whether a similar work would be adapted for the completion of the Arc de l'Etoile. Parisians were not satisfied, and it had to be removed without bringing any commission to the sculptor. He made another experiment for the glorification of France. As the Parthenon used to contain a great statue of ATHENÉ, M. FALGUIÈRE modelled a colossal figure representing the Revolution, which was to extend from the floor of the Panthéon to the springing of the dome. The Government were not sufficiently courageous to order so costly a work. It was therefore removed to the Dépôt des Marbres, which is the refuge for many ambitious attempts. The workmen in some of the ateliers which are lent to sculptors turned the statue into a rabbit warren. But it brought the men only a scanty supply of game, for hordes of wild cats disputed their rights. So much inconvenience was caused by the rabbits and cats, orders were lately given for the destruction of the model. Then it was found that the interior was a cemetery for the two varieties of quadrupeds.

THE announcement that the tower of Saint-Jacques la Boucherie stands in need of reparation is sure to cause some commotion in Paris. As every visitor to the city is aware, it stands within a public garden at one end of the Rue de Rivoli. It is only a relic of the church and was constructed in 1522 at the expense of NICOLAS FLAMEL, a scholar who on account of his wealth was reputed to be an alchemist. In the early days of the Revolution the church was seized as national property, but the tower was allowed to remain. It was, however, utilised by some private people, and the first floor was used as a shot factory. The Romantic movement and VICTOR HUGO's "Notre-Dame" revived the interest in Gothic architecture. The Municipal Council of Paris, responding to a general desire, purchased all rights of proprietorship in the tower and site of the church. It is needless to say that it was restored and that new sculpture was introduced. A statue of PASCAL was placed in the centre of the lower storey. There was some reason for the selection. PASCAL had used the tower for experiments which he made in order to ascertain the weight of the atmosphere. The tower has become since so familiar a landmark that few people care to consider it was ever attached to a building. It is not only one of the most beautiful structures in Paris, but it appears to be absolutely complete, and may be taken as a perfect example of adaptation.

AN international exhibition will be held in Venice from April 22 to October 31, 1907. Invitations will be sent to distinguished artists, but no work which has been already exhibited in Italy will be accepted. The work of artists not personally invited will be submitted to the decision of a jury of admission composed of five members. Except in the cases of collections of certain celebrated artists, either living or deceased, and in other special circumstances, no artist will be allowed to send more than two exhibits of the same class. Gold medals will be awarded. Intending exhibitors must give notice in a duplicate form not later than January 1, 1907. Applications for forms and all subsequent communications must be made to the following address:—Segretario Esposizione Artistica, Municipio, Venice, Italy. The exhibits must reach the exhibition building not later than March 25. Special facilities will be granted to foreign artists. Similar exhibitions have proved a great success, and have been very useful in the promotion of all branches of art. Great credit is due to the municipality of Venice for carrying on every two years so difficult an enterprise, which, however, has obtained approval and praise from all artistic centres in the world. With a view to improving the artistic taste of the public in their everyday life the decoration and fitting-up of the exhibition will be undertaken by selected house decorators. The decoration will harmonise with the works of art exhibited in the rooms.

ABERDEEN UNIVERSITY.*

AT a time like the present, when the connection between education and national welfare is more recognised than formerly, it is satisfactory that the KING and QUEEN were enabled to inaugurate yesterday important additions to the University of Aberdeen. That university may not appear ancient when compared with Oxford and some of the Italian institutions, but it has at least an existence of four centuries, which, when all the circumstances of its position are taken into account, is remarkable. In fact, it might be said that Aberdeen was unique in possessing a pair of universities. King's College, which was founded by Bishop ELPHINSTONE in 1495, long exercised the privileges of a university. A century afterwards, during the reign of JAMES VI., Marischal College was founded by the fifth earl marischal. It was therefore a post-Reformation institution, and much of the property which once belonged to the Greyfriars was made over to it. Not until 1860 were the two universities combined.

Marischal College possesses an interest far beyond the boundaries of Scotland. Romance has thrown a glamour over it. Sir WALTER SCOTT during a dangerous illness created the Ritt-master DUGALD DALGETTY of Drumthwacket, who fought under GUSTAVUS ADOLPHUS and many other leaders of that time, and was as proud of having been a student at the Marischal College of Aberdeen as of any of the battles in which he took a part. His name is likely to live as long as that of any of the learned professors from whom he derived his skill in ratiocination. To many it may seem strange that a warrior or *condottiere* who changed sides as occasion offered should have been a product of a seat of learning. But SCOTT, as usual, knew what he was about in describing the shrewd hero. In other universities there were rows between the students and the outside inhabitants. No doubt they served the same function as rowing and cricket and gymnastics in modern times for strengthening legs and arms. But in Aberdeen education had to be carried out under more serious difficulties. The majority of the students were likely to be poor and could adopt the motto which SYDNEY SMITH proposed to have printed on the title-pages of the *Edinburgh Review*, "Tenui musam meditamur avena;" but, poor or rich, there was always a liability to meet an invasion by the wild Highland clans on one side and of English intruders on the other. Aberdeen, no doubt, endeavoured to protect itself, but from the circumstance that it was the centre of education it was supposed to be wealthy, and was therefore tempting to northern as well as southern enemies. It was not unlikely that men of the character of DUGALD DALGETTY would at an early age learn something of the delight of battle, and would pass from the classrooms to foreign camps, where there was more demand for courage than for book-learn. Indeed, the old warrior said he preserved a very distinct idea of Highland tactics in his student days.

The Ritt-master, as we know, was not altogether an enthusiast for reformed or orthodox ideas. He was quite willing to serve the Royalist party or the party of the Scottish Convention of Estates. That might be ascribed to old associations. Although Marischal College, as we have said, came into existence after the Reformation, yet Episcopalians and others whose sympathies were with the old system were allowed to hold office. It was difficult to steer the university through the troubles which were everywhere in Scotland for a long period, but there were skilful men in the university and through their tact its position remained secure.

The picture which BOSWELL gives of the professors when JOHNSON visited Aberdeen in vacation time shows an established condition which might be compared with that of Oxford or Cambridge. The English writer was treated with extreme courtesy. BOSWELL, who loved

opportunities for recording JOHNSON's power in disputing, tried to get up arguments on special subjects. He imagined, probably, that in such a place Scotch logic would be forthcoming in its most emphatic form. But the professors were aware of their English visitor's peculiarities and let him have his own way; indeed, JOHNSON had to confess that too much was done to entertain him, his only regret being that the Aberdonians had not started a single mawkin (or hare) for him to pursue. A glimpse of the kind is more valuable than a disquisition about the state of university government in Aberdeen. It becomes evident that the professors were gentlemen as well as scholars and were able to set an excellent example to the youths they lectured.

There are two theories concerning a university education which we may call the conservative and the reforming. According to one theory the system which has come down to us through several centuries and has been tested by civilising many varieties of men is no less adapted to the present time than to the future. On the other side it is said that the world advances, changes or develops irrespective of educational systems, and that universities should be altered to suit the existing state of humanity. The Scottish universities between forty and fifty years ago were made the subject of Royal Commissions, and a great many modifications of old principles had to be adopted. We may even suppose that the desire to make the best use of everything compelled even the most conservative of dons to accept the new experiments. One was the unification of King's College and Marischal College and a division of duties between them. More importance was given to science. Then, of course, it was found that ordinary classrooms and oral lectures like those which had been delivered from the foundations of the colleges would not suffice. In the old days the professors formed the university. They could lecture in the open air, in houses, in the seclusion of forests or in academic groves if they were forthcoming. Science not only teaches, but demands space for experiments and for machinery, museums, and in various ways commodious buildings become a necessity. The men whose names were associated with the Aberdeen University prior to 1858 were followers of literature, theologians, historians, preachers, authors, but scientific men could not well be trained in the old-fashioned rooms in which DUGALD DALGETTY studied the humanities.

Fortunately money was soon forthcoming. The Mitchell Hall and Tower will recall the memory of Messrs. MITCHELL, of Newcastle-on-Tyne (one of them was the painter of the noble picture of *Hypatia*, which gained so much admiration in one of the exhibitions of the Grosvenor Gallery), who expended some 40,000*l.* on the work. Lord STRATHCONA gave 25,000*l.* The Government granted 40,000*l.*, and altogether over 200,000*l.* was obtained.

The new buildings are evidence that the money was wisely expended. Aberdeen is known as the Granite City, and the College frontage to Broad Street of 400 feet in a very light grey stone from Kenmay is a worthy addition to the architecture which will support the title. Opinions may differ about the suitability of the style. When Marischal College was founded Renaissance was ascendant, but sentiment counts for much, and Aberdeen is supposed to have been a royal burgh as far back as 1179. The character of the granite was also to be considered, and it will be allowed that the style adopted expresses some of its qualities. The series of buttresses has a peculiarly effective look, and with their pinnacles they are suggestive of a militant building which will offer stern defence against ignorance and prejudice. FERGUSSON, although a Scotsman, considered that granite was not suited to express Gothic grace. The new College buildings are a refutation of his theory. The entrance gateway suggests by its heraldic embellishments the history

* See Illustrations.

of the university. The Mitchell Tower is 230 feet in height, and the entrance to it leads also to the picture gallery and to the assembly hall. The whole of the architectural work has been designed by Mr. A. MARSHALL MACKENZIE, A.R.S.A. The names of the contractors merit to be recorded. They were as follows:—Mason—JOHN MORGAN; carpenter—D. MAC-ANDREW & Co.; slater—ALEX. ADAM & Co.; plasterer—J. SCOTT & SON; plumber—J. BLAICKIE & SON; painter—J. WHYTE; ironwork—JAS. ABERNETHY & Co.; electric lighting—A. B. ROBERTSON & SON; electric lift—ARCHIBALD SMITH & STEVENS, London; warming and ventilation—SHIRRAS, LAING & Co. The fittings and furniture were produced by J. & A. OGILVIE, CLARK & DONALDSON, JAMES ALLAN & Co., BROWN & THOMSON, J. R. WISHART, HENDRY & KEITH and the Art Metal Construction Company, Jamestown, New York. Mr. GEORGE REID was clerk of works and Mr. A. DAWSON, surveyor.

The ceremonies connected with the opening began on Tuesday, when there was service in the chapel of King's College, a procession from Marischal College to the Strathcona Hall, a reception, a banquet and a torchlight procession. On Wednesday honorary degrees were conferred in the Mitchell Hall, there were sports in the recreation-ground, a students' ball and a reception in the new art gallery of the city. Yesterday His MAJESTY THE KING inaugurated the new buildings and Lord STRATHCONA, as chancellor of the University, gave a banquet. To-day there will be further meetings.

The good wishes for the success of the university in its buildings, whether old or new, will not be confined to Scotsmen nor to Great Britain.

NEW BOOKS.

IT is only reasonable that books for professional readers should be issued like those of an entertaining class at the approach of winter. Every business has its fictions, and publishers still imagine that the majority of people find compensation for winter and its long evenings in reading. There is no doubt the belief is general, and it is quite allowable to take advantage of it. The following short notices will suggest the character of the first batch we have received. A second edition has been issued by Mr. B. T. BATSFORD of Mr. RICHARD GLAZIER'S "Manual of Historic Ornament." It is an admirable abstract of the history of applied forms. The 600 illustrations are typical of styles and periods. They are not only selected with judgment but they are finely drawn, and there is no scamping of the elements of composition. None of the intricacies of Byzantine, Scandinavian or Celtic ornament are evaded, and this thoroughness is by itself a lesson for the student. The descriptions are condensed, but every sentence may be taken as the expression of a fact which is worth remembrance. A student who has mastered the book will find himself in a position to commence the creation of ornament on his own account. The manner in which the book is produced aids its purpose.

When it is said that the 200 pages of Mr. WALTER DEL MAR'S "Romantic East: Burma, Assam and Kashmir" (London: A. & C. BLACK) are illustrated by seventy-three full-page photographs of foreign scenes, it will be evident that his book is of a pleasurable kind. The author has an eye for the picturesque, and he gives views of temples, palaces, landscapes and boats which are almost enough to tempt a painter to seek out Burma, Assam and the most beautiful and fertile valley of Kashmir. Unlike many other modern travellers, Mr. DEL MAR does not pose as a politician. He found enjoyment in his travels, and by pen and camera he does his best to make a reader be a sharer with himself. He has the sympathy with natives which should be a quality with all sensible travellers, and he has contrived to give a better account of that part of Asia than is to be found in official publications.

The subject of water supply is receiving much atten-

tion at the present time, but not more than it deserves. It is, however, generally considered as referring to supplies for cities and towns. The purpose of Mr. W. H. BOOTH'S treatise on "Water Softening and Treatment" (ARCHIBALD CONSTABLE & Co., LTD.) is more limited, for it applies to the quality of water for steam boilers and manufacturing purposes. In most places householders are aware of the inconvenience which arises from the deposit of chalk and other materials in the domestic boiler. The filtering in waterworks is insufficient to overcome a danger for which chemical processes more or less elaborate must be employed. The inconvenience assumes a different character when it is found in connection with machinery, and a great variety of apparatus have been invented in order to remove or otherwise overcome impurities which are both dangerous and costly. Mr. BOOTH has investigated the subject thoroughly, and he has been able to obtain detailed drawings of the apparatus manufactured by Messrs. DOULTON, MATHER & PLATT, the Pulsometer Company and many others. His book is therefore one which should be possessed by all who employ steam or water-power in any form.

Another of Messrs. CONSTABLE'S books is on "The Chemistry of Paints and Paint Vehicles," by Mr. CLARE H. HALL. It is an American work, and, as the author says, has been written [from the standpoint of a chemist employed in the manufacture of paints and colours. Those who use colours may find an occasional suggestion which can be turned to account. But it is evident that an expert alone will be able to detect adulteration. The chapters relate to (1) The Determination of the Elementary Constitution of Paints; (2) Raw Materials, Properties, Tests and Methods of Analysis; (3) The Analysis of Dry Colours, Pastes and Liquid Paints; (4) The Matching of Samples; and (5) Paint Vehicles.

The "Handbook on Reinforced Concrete," by Mr. F. D. WARREN, of the Massachusetts Institute of Technology (London: CROSBY LOCKWOOD & Co.), is an addition to the numerous books on a subject which might almost be said to be monopolising the attention of engineering investigators. The author aims at supplying the requirements of designers who have not much time to spend in working out calculations of strength and dimensions. Under each section many tables and diagrams are introduced, and by a little attentive consideration both can be turned to account in everyday practice. Mathematics are only employed to a very limited extent.

"Fowler's Architects' and Builders' Handbook" (Manchester: The Scientific Publishing Company) is a very cheap and comprehensive collection of tables, rules and data. The index alone fills fifteen pages, and from that fact the comprehensiveness of the handbook can be judged. Diagrams are also given, and the book is well adapted to be a *vade mecum*.

A small history of English architecture recently appeared from the pen of Mr. T. D. ATKINSON, architect. He has now produced a companion to it in "A Glossary of Terms used in English Architecture" (London: METHUEN & Co.). It may seem an easy task to write such a book, especially if the definitions in other glossaries are employed. Mr. ATKINSON endeavours to formulate his own explanations, and he has so far succeeded that his pages can be read through as well as referred to when occasion demands. It is well printed, and there are a large number of illustrations which appear to have been especially prepared. We hope that by its aid interest in architecture will be promoted.

PIERRE-PAUL PUGET.

A FEW days ago Marseilles was rejoicing over the inauguration of a statue of the famous sculptor, PIERRE-PAUL PUGET, whom it claims as a son. It is never very difficult to create excitement in the southern seaport, and to make much ado about nothing. But in

this case there was good reason, for PUGET was a man of whom France as well as Marseilles should be proud. The Ministers who attended and who delivered speeches were only expressing the national opinion in their eulogies.

PUGET was born at Marseilles in 1622, or, as M. LAGRANGE asserts, at Séon, near the city. In those days artists did not confine themselves to one branch of art, and his father was described as an architect as well as a sculptor, but was not successful in gaining a reputation in either art. We are afraid it cannot be said he was an affectionate father, for he got rid of his son when the boy was fourteen and apprenticed him to a sculptor, who seems to have been employed mainly in the production of figure-heads for ships, and who also appears to have designed vessels. Young PUGET soon distinguished himself. He was, however, restless, and having heard some of his companions talk about the great artists of Italy, he resolved to go there. In other words, he ran away from his master, and in his fifteenth year he found himself penniless in Florence. He obtained employment with a wood-carver and again displayed his ability. But he was tired of Florence in about a year and then went to Rome. There he found a kindred spirit in BERETTINI, who is better known as PIETRO DA CORTONA. He was one of the prominent men in a period of decadence in Italian art. He was not without ability, but all his efforts were directed to produce startling effects in colour and composition. He was about the last man who was fitted to instruct a young sculptor. But PUGET at the time had no settled purpose, and his highest ambition was to imitate the master as a painter. From the effect of BERETTINI'S influence PUGET was never able to emancipate himself.

After three years PUGET returned to Marseilles, and as he could paint as well as carve and design it was not difficult for him to find employment. The Duc de BREZÉ was then Grand Admiral of France. He heard of PUGET and summoned him to Toulon, where he gave him a commission to prepare a model of the most beautiful ship it was in his power to create. That was the origin of the floating palace the *Monarque*, which was once as famous as the *Livadia* of later time.

Whether PUGET produced also works of sculpture is doubtful. His occupations in his own country could not overcome his longing to be again in Rome. Accordingly he went back to that city, and as his ideas were more matured, he was able to derive greater benefit from the works of art which were before his eyes. In 1653 he left Italy and set up in his native city as a painter. The price he charged for large pictures was about four francs per square foot. He fell ill and a wise physician counselled him to follow sculpture, as it would allow of more exercise of his muscles. Accordingly he gave up painting and took to sculpture. He also professed to have competence to practise as an architect.

The first works he produced caused surprise by their extraordinary vigour. They are the pair of terms or caryatides supporting the balcony of the Hôtel de Ville in Toulon. He could not believe that men or slaves in such a position would have the calmness and indifference of the antique examples. He therefore represented them as if they were as conscious of the enormous weight they sustained as any of the porters on the quays. Louis XIV. quickly heard about them, and he at once commanded that they should be transported to Versailles. As they were made up of several pieces of marble, removal was found to be dangerous, and they are still left to ornament Toulon. Near the Hôtel de Ville is a house which it is said PUGET designed. Afterwards he produced a statue of *Hercules* and a group representing the *Earth Crowning Janus* for a château in Normandy. They were seen by LE PAUTRE, the artist, and he spoke of them to FOUQUET, the superintendent of finances, who at the time seemed to be resolved to surpass Louis XIV. as a patron of

art, and who succeeded in exciting the monarch's envy, although it brought the official to ruin.

In those days the patronage of FOUQUET was a guarantee of good fortune. Having the command of almost unlimited funds, he was enabled to reward services in a grand manner. He first ordered PUGET to proceed to Genoa in order to purchase beautiful marbles. While waiting to have them embarked the sculptor produced the figure now in the Louvre and known as the *Gallie Hercules*. It is far more suggestive of the style of PIETRO DA CORTONA than the caryatides of Toulon. Before PUGET had followed the marbles to France the news arrived of the disgrace of his patron. He therefore remained in Genoa, where he obtained commissions for large statues for churches, some of which he tinted. He also executed a great bas-relief of the *Assumption* for the Duke of MANTUA. The latter was seen by LEBRUN, the favourite painter of Louis XIV., who spoke of it to COLBERT, and the consequence was that PUGET was recalled to France by the king, and was appointed sculptor and director of the works relating to the ornamentation of vessels, or, in other words, became the chief figure-head carver for the royal ships. A pension of 1,200 crowns was awarded to him.

He obtained from COLBERT three of FOUQUET'S blocks of marble. One of them he used for the statue of *Milo of Cretona*, which many consider to be PUGET'S principal work, and some French critics have claimed that, as an expression of pain, it can be compared with *The Laocoon*. He was not able to discover a model who was sufficiently courageous to allow his foot to be compressed in order to impart reality to the statue. PUGET was compelled to enact the athlete, and when his foot was sufficiently distorted by pain a cast was taken of it, which was copied in marble. Although the work occupied the sculptor for four years, COLBERT offered to pay the ridiculous sum of only 6,000 livres for it. Some of the artists who enjoyed Court favour were jealous of the success of the *Milo* and afraid PUGET might become a rival. They contrived to have the *Milo* placed in an obscure corner at Versailles, where few could see it. The king, however, insisted on its removal to a more suitable position; it is now in the Louvre. Another block was used for the relief of *Alexander and Diogenes*, which did not please amateurs. It was said of it that it might have been designed by JORDAENS, and that the horses could not have been studied from nature. But with all its faults it was a courageous undertaking. Louis XIV. ordered a group of *Perseus and Andromeda*, which His Majesty naturally considered to be PUGET'S masterpiece, and the courtiers agreed with the royal critic, but the sculptor was not satisfied with it.

PUGET could not escape the fate of the majority of artists who sought to win the approval of Louis XIV. The defects of his works were magnified. The sums paid for them did not correspond with their value, and in fact he was treated as if he were a provincial journeyman stonecutter. Worst of all, LEBRUN, the painter, presumed to offer designs for works at Versailles to PUGET, and assumed the authority and manner of an overseer. The sculptor could not accept royal patronage on those terms, and he fled from Paris to Marseilles. His last work was a bas-relief representing the *Plague of Milan*, which is now in the Musée of Marseilles.

PUGET has been compared with MICHEL ANGELO. He resembled the great Florentine in his power of cutting the marble without the aid of full-sized models or mechanical appliances. PUGET said, "The marble trembles before me." One of his contemporaries said that while a part of his *Milo* was almost completely finished, other parts were not even roughly hewn from the block. PUGET would have approved of M. RODIN'S system of leaving a part of the marble in the state it left the quarry. PUGET'S works are not to be judged by Greek standards, and it must be allowed that his vigour is sometimes not unlike coarseness. But all must admire the manliness of his life and the spirit in

which in the seventeenth century he declined to bow to courtiers or to officials. He one time broke one of his own statues when the noble who ordered it began to haggle about the price. Perhaps it is on account of his independent spirit as on his ability that the French continue to admire him and have placed his statue in one of the public places of Marseilles, and his bust as pendant to NICHOLAS POUSSIN's at the entrance to the École des Beaux-Arts.

INGRESS HALL.*

INGRESS HALL has a history which dates back as far as 1353, when King Edward III. granted the "Manor of Ingrycce," as it was then called, to the "Prioress and Abbey of Dartford for ever," and it remained in their possession till the suppression of that priory by King Henry VIII., by which means this establishment with their other possessions came into the hands of the Crown.

According to Hasted, a very small time before the Dissolution, viz. September 4 in the thirtieth year of that reign, Jane Fane, prioress, and the Countess of Dartford by their indenture under their conventual seal let "to ferme" for seventeen years to Robert Mariel, of Swanscombe, husbandman, at the yearly rent of 10*l.*, all that their farm called Ingress, with all houses, buildings, lands, woods, pastures, marshes, &c., belonging to it in Swanscombe, late in the tenure of Richard Grove, "fermor of it," and all their cliffs called Downe Cliffs, with liberty to dig and carry off chalk there to the amount of one acre in length and breadth, which lease Martin Mariel, son of Robert, surrendered up to King Edward VI. in his fifth year, and had another granted him of these premises on paying a fine of 10*l.*, to hold for twenty-one years, at the yearly rent of 10*l.* The fee simple of this estate remained in the Crown till Queen Elizabeth in her fifth year granted it to Edward Darbyshire and John Bere, who not long after conveyed it to one Jones, who, in the latter end of James I.'s reign alienated it to Whaley, and he settled it on his kinsman, Mr. Thomas Holloway, who conveyed it to Shires, and he, by Mary his wife, who survived him, left two sons, Edward and Robert Shires, of the Inner Temple, Esqrs., which Mary and her two sons in 1649 conveyed the mansion house, manor and farm called Ingress, and the several lands thereto belonging, chalk cliffs, limekiln, wharf, salt and fresh marsh, to Captain Edward Brent, of Southwark, who by his will in 1676 gave the same to Christian, his wife, for her life, with remainder to Edward Brent, Esq., their son. He conveyed it by way of mortgage to John Smith, of Camberwell. It next passed through several hands until it came into the possession of the Earl of Hyndford, who in 1748 sold it outright to William Ponsonby, second Earl of Bessborough, whose wife and seven children died here of a malignant disease, and he became so disgusted with the place that in 1760 he sold it to Mr. John Calcraft, then M.P. for Rochester, who died in 1788, when it passed into the hands of Mr. John Disney Roebuck, who a few years afterwards conveyed it to Mr. William Havelock, ship-builder, of Sunderland, father of General Sir Henry Havelock, of Indian fame. Sir Henry was not born here (as some have stated), but he spent his early childhood here, until the death of his mother in 1811. When misfortune overtook his father through unsuccessful speculations the latter conceived the idea of converting Ingress into a Royal dockyard, and with this end in view he demolished the ancient mansion; but his naval design was never carried out. In 1820 the estate was bought by Alderman James Harmer. The house was occupied by the unfortunate Queen Caroline before its demolition.

Alderman Harmer was the son of a Spitalfields weaver, and was left an orphan when he was ten years old. He became an attorney in the criminal courts. He was mainly instrumental in the abolition of "blood money" paid to informers, and acquired a practice of about 4,000*l.* per annum. He was the founder and proprietor of the *Weekly Dispatch* newspaper. In 1833 he was elected alderman of Farringdon Without, and sheriff in 1834. He resigned his aldermanic gown on being rejected when next in succession for Lord Mayor. He erected Ingress Hall in 1833 from the stones of Old London Bridge, and for the first time called it "Ingress Abbey," but this is a

misnomer, as it never was an abbey, but was anciently the grange, manor-house or farm attached to Dartford Priory, as already shown. Parker's "Glossary of Architecture" says "granary" is sometimes used for "grange," or *vice versa*, and "most of the religious establishments had farm-houses on their estates." James Harmer was born in 1777 and died in 1853 (aged seventy-six years) at Cricklewood.

A good deal of the old carved woodwork of the former mansion has been reused at Ingress Hall, particularly the hall mantelpiece dated 1668. In the library there is some very beautiful wood carving to the bookcases. In the grounds, which are about 60 acres in extent and well-timbered, are still to be seen traces of the old Grange and farm buildings. An interesting old archway which recently spanned across the avenue leading to Greenhithe has, it is to be regretted, been lately pulled down.

Alderman Harmer died without male issue and left Ingress to his granddaughter, the wife of Mr. Samuel Charles Umfreville, and since his death in 1894 the mansion has been untenanted, and only recently his trustees have disposed of the property to be converted into a cement manufactory. The last resident here, we are informed, was Mr. Holder (of Holder Brothers), shipping merchant.

Eliza Cook, the eminent poetess, used to write verses for the *Weekly Dispatch*. This led to an acquaintanceship, and Alderman Harmer invited her to reside at Ingress. Some trees are still shown in the park under which she used to write poetry. She was born at Southwark in 1818, and was daughter of a London tradesman. She contributed poetical pieces to various magazines from an early age, and issued her "Melaia and other Poems" in 1838, which, along with the issue of volumes in 1864 and 1865, established her reputation as a meritorious verse writer. She conducted *Eliza Cook's Journal* from 1849 to 1854, when ill-health obliged her to relinquish it. In 1864 a pension of 100*l.* per annum was conferred upon her by Government.* She also wrote "Jottings from My Journal," 1860, and "Laconics," 1865. I will conclude with a verse or two from "The World," a poem I learnt when at school, by Eliza Cook:—

Talk who will of the world as a desert of thrall,
There is bloom, there is light on the waste;
Though the chalice of life hath its acid and gall,
There are honeydrops too for the taste.

We murmur and droop should a sorrow cloud stay,
And note all the shades of our lot,
But the rich scintillations that brighten our way
Are basked in, enjoyed and forgot.

Those who look on mortality's ocean aright
Will not mourn o'er each billow that rolls,
But dwell on the glories, the beauties, the might,
As well as the shipwrecks and shoals.

How thankless is he who remembereth alone
All the bitter, the drear and the dark,
Though the raven may scare with woe-boding tone,
Do we ne'er hear the sound of the lark?

The wail of regret, the rude clashing of strife
The soul's harmony often may mar;
But I think we must own in the discords of life
'Tis ourselves that oft waken the jar.

Sir Henry Spelman, in his "History of Fate and Sacrilege," says that when the Prioress of Dartford surrendered the Grange at Ingress she cursed all its future owners, and adds, "all the males have been unfortunate ever since." In Kelly's "Directory" will be found a list of their names.

RICHARD PARKES BONINGTON.

THE position of Richard Parkes Bonington in the history of art is somewhat unique. He is claimed as a representative painter of the French school and also of the English school. There is no doubt that he exercised an influence on French landscape art, and at the same time as Constable, but there was a difference between the two men. Constable had perfected his style in England, and he was appreciated in France because he proved by his works that there were other ways of representing nature besides those followed by the academical artists. Bonington also was a revealer; but what gave most interest to his paintings was that he had gone through the same training as Frenchmen, and had even worked under such a master as the Baron Gros. It is therefore not exact to say Bonington brought

* A paper by Mr. W. F. Potter, architect, read on the occasion of the visit of the Woolwich Antiquarian Society.

* Eliza Cook died at her house in Worple Road, Wimbledon, September 24, 1889.

English methods to bear on French art, for while in England the artist had given no indication of the possession of any special power in art. What is most amazing in Bonington's career is that he was able to display so many indications of power. He had hardly attained his twenty-seventh year when he died. Up to his fifteenth year he had received little instruction. All that he accomplished was therefore the work of a few years, and valuable as are his paintings, if he had lived he must have surpassed them. That was the opinion expressed by Sir Thomas Lawrence, who wrote:—"The last duties have just been paid to the lamented Mr. Bonington. Except in the case of Mr. Harlow, I have never known, in my own time, the early death of talent so promising, and so rapidly and obviously improving. If I may judge from the later direction of his studies, and from remembrance of a morning's conversation, his mind seemed expanding in every way, and ripening into full maturity of taste and elevated judgment, with that generous ambition which makes confinement to lesser departments in the art painfully irksome and annoying."

His early life was not of a kind to promise success unless of the kind which was obtained by George Morland. The grandfather and the father of Richard Parkes Bonington were governors of Nottingham Goal. His father was not suited to the office, for on one occasion he was arrested for riotous and disorderly conduct in the streets, and what was worse he endeavoured to convert the prisoners to his belief in the benefits of a revolution. He was therefore compelled to leave. After resigning his office until his marriage with Miss Parkes he practised as a portrait-painter and also published a few prints in coloured aquatinta. Upon their marriage they set up a ladies' school at Arnold, a village about five miles from Nottingham, where, on October 25, 1801, Richard Parkes Bonington was born. After remaining at Arnold a few years, the family removed to Nottingham and finally settled in St. James's Street, where their school was well supported. Being an only child, young Bonington was regarded with more than ordinary solicitude by his parents. Bonington early displayed a predilection for drawing, but this inclination was never considered in any higher light than such juvenile efforts usually are. The general amusement and occupation of Bonington and a young companion named Samuel Hulse was drawing anything and everything which came before them; but what above all other projects mostly occupied their time and invention was the forming and painting of cardboard theatrical characters, with movable heads and caps. It was then anticipated that Bonington would become an actor, and, like a second Lawrence, his fate was poised betwixt the two pursuits of the drama and painting. What still more tended to strengthen the general belief that the stage would form his future career were the examples he gave of his histrionic powers in conjunction with other juvenile friends at the house of his companion, in a very large apartment which Bonington entirely fitted up himself, having painted all the scenes and played the "acting manager," always to the satisfaction of his "numerous audiences," which generally consisted of as many of his friends as could find room.

The period now, however, approached when the scenes and amusements of youth give place to the more stirring and active movements of life. Through his imprudences, Mr. Bonington forfeited his situation as governor of the county gaol, and by repetition of the like conduct his friends fell off, his school became reduced, so that ultimately he was compelled to leave Nottingham and England, and fly to France, where, by business connected with the lace trade, he supported his family at least until the rising eminence of his son opened another direction to his mind.

It has been said of him that his son's "productions completely confirmed his desire to take every opportunity of leading him to the arts as a profession, and he accordingly continued to direct his attention to the works of the best masters, but above all to nature, the mother, nurse and guide of true genius." Again:—"At the age of fifteen his parents journeyed to Paris, feeling assured that the facilities for study afforded by that capital were much more important than any which could elsewhere be attained." So far indeed from Mr. Bonington's taking "every opportunity of leading him to the arts as a profession," he never considered the subject at all; and the whole training and pupilage of the son was left to his affectionate and accomplished mother. It is true Mr. Bonington practised as a portrait-painter, but it was more in the name than the principle; and even if he had possessed the talent sufficiently for directing his son's abilities, his

inclinations withdrew him always to other scenes and pursuits; for when he ought to have been in attendance on his family and establishment, he was enacting the political mountebank in a waggon in some part or other of the town. It was during one of these performances in the market-place at Nottingham, when a vast assemblage were listening to the "orations" of Mr. Bonington, that young Bonington and his "bosom friend" happened to pass; and young Hulse remarked to his companion, "Look at your father." "Ah!" replied the other with tears in eyes, "this is all I get by it"—at the same time taking a solitary penny bun from his pocket to eat for his dinner, as symbolical of his then lowliness of fortune.

The nature of Bonington was essentially precocious, and though it was not displayed in any of those astonishing efforts of the pencil that characterised the dawning genius of Lawrence, yet the few years in which he was enabled to make himself the "observed of all beholders" showed that his genius was of the highest order. This precocity was further developed in his person and manners. Tall for his age, though only fifteen, his general appearance and manners were manly, and his countenance and stoop of the shoulders indicated great penetration and thoughtfulness.

From his settlement at Paris we must date Bonington's commencement as an artist. His genius, which when at Nottingham was merely exercised on insignificant subjects, now, when surrounded by every incentive that can add fuel to the devouring flame of ambition, and feed the insatiable aspirations of enthusiasm, concentrated its energies to the fulfilment of its high destiny—the glory of the art. It was then that the father felt the full conviction of the genius of his son, and seriously set to work to aid his improvement. The first step was admission into the Louvre—this was quickly obtained. Here his improvement was extremely rapid; and from hence he was entered as a student of the Royal Institute of France, and became a pupil in the atelier of the Baron Gros. But such a circumstance was needless to one of his powers; genius requires but to be shown the first rules to the studying of nature, and rebels if restrained in its exuberance of feeling. Bonington soon provoked the reproaches of Le Baron Gros, because he disdained to follow the dry routine of the academic rules of his master's atelier. However, after Bonington had established his reputation, "M. Gros, who, on what was probably a very frivolous pretext, had shut his atelier against Bonington, eventually did him justice. He recalled him, and in the presence of all his pupils, who were enchanted with the success their comrade had achieved, praised his fine talents, which no one had directed, and begged that he would have the goodness to become one of the ornaments of his school." After quitting the Baron, Bonington continued to draw the living figure at the Institute, and left it only when he felt sufficient confidence that he could proceed without further attendance.

Nature, in Bonington, found an enthusiastic and unalterable devotee; and his sketches and studies of figures and scenery breathed the very elements and air of nature, executed in a style bold in conception, powerful in chiaroscuro, and broad and rich in effect. About the year 1822 he went to "Fair Italy, nursery of the arts," and in his views and studies of Venice he has rivalled the pictorial creations of Canaletto and Guardi.

In Paris, the works of Bonington always met with extensive patronage, whether they were his water-colour or oil-paintings; but to his own countrymen in England he was long unknown. It was not until February 1826 that the generality of Englishmen were aware of the genius they might claim; it was then he exhibited at the British Institution two views on the French coast, which excited much attention and took the critics by surprise. The question of "Who is Bonington?" was echoed from one to another; and one journal set it down that there was no such painter as Bonington, and gravely fathered the pictures on William Collins. When, however, the mistake was discovered, the critic attempted to correct his error by saying, "Can we pay Mr. Bonington a higher compliment?" Assuredly it was a high compliment, though not a very happy one, for, beautiful as the works of Collins undoubtedly are, still his style is very different from Bonington's. But it was no wonder that the two paintings in question should have puzzled the critics, when it is recollected the high style of art in which they were executed. Bonington's work met with that regard and attention which their great excellence demanded. They were so utterly unlike any style of that day, so firm and broad, and exhibited such harmony and breadth and splendid chiaroscuro, such perception of the high principles of art and mechanical skill as have been seldom

found united. His *début* may justly be termed triumphant, and, although his sojourn in the world of art was but brief, yet his short career was brilliant and successful; but, unfortunately, his very prosperity became the insidious destroyer of his existence. Impelled onwards to extraordinary exertions to grapple with the flow of patronage which showered upon him, he exposed himself unguardedly to the great heat of the sun while sketching in the open air, which brought on a brain fever and a subsequent severe illness. He was at Paris when this occurred, which terminated in a rapid consumption; and the anxiety which seized all his friends can scarcely be conceived by those who were not personally conscious of his many endearing qualities, his nobleness and generosity of mind and heart. This insidious disease baffled all human intervention, and left its victim but sufficient strength to travel to London on a desperate attempt to seek relief from St. John Long. On September 23, 1828, at the house, No. 29 Tottenham Street, his mortal career closed in the twenty-seventh year of his age. On September 29 he was buried in a vault at St. James's Church, Pentonville, attended by a numerous assemblage of private friends, Sir Thomas Lawrence and Mr. Howard appearing on the part of the Royal Academy; Mr. Robson and Mr. Pugin as the representatives of the Society of Painters in Water-Colours.

The genius of Bonington was of the highest order of originality and flexibility; of that flexible nature that, while it made the works of others the proximate cause of its own elevation, still could preserve itself free from the taint of mannerism. He never designed anything purely historical, nor would he have succeeded if he had; his eye was too luxuriant, too much imbued with the feeling for colour. His forte was dramatic painting and delineations of actual objects of nature; and we have only to compare his figure compositions with his coast views, to confirm our opinion. His works in the latter style are fine—so entirely original and masterly, and his sketches in water-colours are really and truly "gems of art." The paintings he exhibited at the British Institution in 1826 have already been mentioned, and he was satisfied with the manner in which they were placed. This was not, however, the case with his treatment by the Council of the Royal Academy in 1828, when he sent there two pictures, one of "Henry III. of France," and the other "A View in Venice." In the January following (1829) at the British Institution appeared his last picture, "A Turk Reposing," which was treated with masterly feeling and was exquisitely rich in colour.

We have before slightly alluded to Bonington's studying the various styles of the different masters eminently distinguished for any peculiar mark of excellence, and the still unmannered and original feeling of his own. He founded a style, the great characteristics of which are a fine perception of the beauties of both nature and art, well balanced management of chiaroscuro, a vigorous and masterly handling, united to a vivid and refined imagination and profound knowledge of the high principles of art. Embodying therefore these varied points of excellence, it is not surprising that he should have been the cause of many individuals becoming his imitators.

There can be no doubt that, had Bonington lived, he would have risen to very great eminence and estimation among the patrons of art in this country, as indeed the high reputation in which his works are already considered fully warrant us in saying—accomplished, too, ere he had reached the age of thirty. In Paris his patrons were many, by which means he was enabled to live in good style and mix with the best society of Paris in a house well fitted up with galleries for his works in the Rue St. Lazare. Indeed, such is the high estimation in which the French hold Bonington that they will scarcely allow he was an Englishman and consequently an English painter. When Sir Thomas Lawrence was invested with the Star of the Legion of Honour by Charles X., and Constable and Copley Fielding were awarded gold medals for their respective works then exhibiting at the Louvre, Bonington also received a gold medal for a marine view.

It has been remarked as extraordinary that Bonington should never have sent any works for exhibition to England before 1826, but no doubt the patronage which he received in France, combined with the general interest which he must have felt for the place where he had been nurtured, strongly actuated his feelings on this point. On his death the French testified their grief for his loss, and universally paid a just tribute to his genius.

The personal appearance of Bonington was singular and striking, bespeaking the man of genius most strongly. In

height he was about 5 feet 11 inches; his eyes, dark and penetrating, were overshadowed by brows thick and reflecting, the forehead square and lofty, the nose long and of the Grecian mould, and the mouth evidence of mildness and resolution. The general expression of his countenance was thoughtfulness, approaching to melancholy. His disposition was mild, generous and highly affectionate, and in every point was the exact counterpart of his mother, whom he loved most tenderly. Like most men of great genius his temperament was uneven, at one time all spirit and animation, full of humour and fun; at another melancholy, quiet and scarcely capable of speaking beyond monosyllables.

His water-colour drawings exhibited, perhaps even more than his paintings, the character of his genius, and his drawings on stone, which were published in France, no doubt restored there the true feeling for that species of art which his works altogether were calculated to improve. He effected a great revolution in the French school, and had he survived a few years his works would perhaps have given a higher tone of feeling even to the English.

Bonington tried all styles, except that which is called historical. What he had intended to do was to borrow from the Middle Ages subjects for a series of easel pictures, in which he was desirous of combining and showing the value of the finish of the Dutch, the vigour of the Venetians and the magic of the English. How deeply it is to be regretted that death struck him ere he could put such a plan into execution. He succeeded equally in marine subjects, in architecture, in landscape and in interiors. Whether he disported with the crayon (so despised since Latour, but the credit of which he re-established), painted in oil or water-colours, or handled the lithographic chalk or pen, he did remarkable things. Water-colours had not been much esteemed in France; Bonington revived them and produced that admirable picture, the "Tomb of St. Omer," which may in point of finishing, solidity of tone and force of effect, compete with Granet's finest works. The beautiful "Picturesque Journey," by Taylor, Nodie and Cailleaux, and a separate collection published by the young artist, attest his superiority as a draftsman of romantic ruins. That which ought not to have happened, happened. The "Fragments" into which Bonington had thrown all the originality of his genius, met with but moderate success. The amateurs did not understand those delightful drawings, but the reception which they experienced from the artists consoled Bonington for the bad taste of the public and for the pecuniary loss which he sustained in consequence.

ROMAN REMAINS AT WINCHESTER.

ROMAN remains deep down under the walls of De Lucy's Early English structure at Winchester Cathedral, according to discoveries lately made by Messrs. Thompson's staff, would seem to fully justify the tradition that on this spot the Roman residents and the Romanised Britons had a temple and rich residences. A Temple of Thor was raised on the spot by Cerdic. The relics of Rome already found include fragments of beautiful Samian ware bowls and domestic vessels, a mortarium, a crucible, a bronze stylus, and two or three much corroded bronze coins, besides flanged tiles. These reminders of a long-past civilisation are carefully preserved by the clerk of the works and the foreman.

The largest Samian ware bowl is represented by two large fragments, showing that the decoration consisted of a hunting scene delineated with great spirit, the decoration of the upper portion, or rim, being a pretty tongue-like ornament. The smaller bowl has a similar ornament, but its chief decoration cannot be ascertained. After its long burial this lustrous ware remains unhurt, and one laments that we have only fragments of vases broken by careless servitors, who threw them away. Amongst the coarser fictilian fragments were part of a large mortarium, of a large vase and some cooking utensils, memorials of the shortcomings of domestics some 1,600 or more years ago.

It is interesting to recall that tessellated pavements have been found on the Close, near the cathedral, and also just outside its lofty and massive wall or boundary. During the works at St. Thomas's Church last week several fragments of common Roman fictilia were found, the site of the church when built on some sixty years ago yielding relics of Romano-British Wintanceastre.

NOTES AND COMMENTS.

IN 1606 JAMES I. granted a Patent to what was called the London Company of South Virginia. Three ships sailed containing in all 105 men. They arrived at Virginia in 1607, and on May 13 fixed on a position for a settlement, which they called James Town in honour of His MAJESTY. Before the year was ended half the number of men had died. The remainder were discontented, and if it were not for Captain JOHN SMITH the whole of the emigrants would have perished. In 1607 he went on an exploring expedition and was taken prisoner. His life was saved by the efforts of POCAHONTAS, "La Belle Sauvage." SMITH had to return to England in 1609. There were then 500 inhabitants in James Town, but in six months the number was reduced to sixty, and as they wished to go elsewhere they proposed to set fire to James Town. JAMES afterwards cancelled the Patent, and in Virginia many difficulties had to be encountered during several years. A wiser policy was adopted by WILLIAM III., and the seat of government was removed to Williamsburg. The tercentenary of James Town is to be celebrated next year, and the occasion has been utilised to restore the parish church at Williamsburg. The first church was erected in 1640, but the building, with the exception of the tower, was destroyed by fire in 1676. The foundations of the original structure still exist, and care has been taken to preserve them. It is now impossible to say what style of building was the Williamsburg church. In the absence of evidence, it has been decided to imitate another seventeenth-century church, which is found in Smithfield, and is also in Virginia. The inhabitants of the Southern State can claim as long an antiquity as the people of New England in the North, and they are right in preserving or creating memorials of their former connection with England.

THE members of the Devon Diocesan Architectural and Archæological Society last week visited the remains of the Abbey of St. Germans, in Cornwall. The church was erected into a cathedral by EDWARD THE CONFESSOR, who with his queen personally enthroned LEOFRIC therein as its first bishop. It was originally an abbey church and probably built in 1023 after the destruction of its predecessor in 1003. The original west end and adjacent portions are the remains of the commencement of the Norman building of 1184. In 1161 the new choir and probably the upper part of the north tower were completed. In 1360 the side chapel was built for the reception of some remains of St. GERMAN from Auxerre. In 1430 the existing south aisle was built, after the western part of the Norman south aisle was taken down, to serve as a parish church. In 1530 the priory met with the fate of others at the Dissolution, and in 1540 the choir, which extended eastward, was abandoned, and the present east window inserted from the choir, similar to that which took place at Exeter Cathedral by the insertion of the fine Perpendicular window. The fall of the chancel in 1592, and its rebuilding in 1600, completes the story of the building vicissitudes of the church in Mediæval times. An abstract of EDWARD's grant is given in the "Monasticon." The king says the Cornish diocese obtained an episcopal throne in memory of the blessed GERMANUS, but on account of the fewness of inhabitants and the devastation by pirates it was prudent to have a safer defence in the city of Exeter. EDWARD therefore willed that Cornwall and Devonshire, with all their churches, should be under the control of one bishop.

MARISCHAL COLLEGE, ABERDEEN.—GENERAL VIEW—
THE MITCHELL HALL.

ON another page some account is given of the new buildings of Marischal College, which were opened yesterday. It may be said that the work was inspired by the gift of the Mitchell Hall. The late Dr. CHARLES MITCHELL was a citizen of Aberdeen, and he fought his way upwards until he became a partner in the engineering firm of ARMSTRONG, MITCHELL & Co., Newcastle-on-Tyne. He was generous with his money, and his son also, who appeared destined to attain a place among the most successful painters of the nineteenth century, was liberal to the college. The Mitchell Hall is 116 feet long, and is well adapted for university ceremonies, and might be taken as suggesting the wealth of the institution. There is also a large picture gallery near the hall. The tower rises to a height of 260 feet above the lower quadrangle, and is therefore within 80 feet of the Victoria Tower, Houses of Parliament. The effect of it behind the new buildings is impressive. Marischal College is at present the scientific part of the university, the arts and divinity finding their home in King's College. The architects are Messrs. A. MARSHALL MACKENZIE, A.R.S.A., & SON, of Aberdeen.

NEW SESSIONS HOUSE, OLD FAILEY, E.C.

ON June 29, 1900, we published the perspective view of the proposed Sessions House, by Mr. MOUNTFORD. We now give a photograph of the building as it has been constructed, and students of architecture will find an interesting exercise by comparing the two and endeavouring to discover a reason for the few changes in detail which have been introduced. The building is supposed to have cost about 400,000/. The contract was carried out by Messrs. HOLLOWAY BROS. On the ground floor is a great hall which unites double corridors, and in which foreign marbles have been employed. They lead to the large refreshment-room on one side and to the offices of the officials on the other. There are rooms for witnesses, jurors, &c., all of which are marked by spaciousness. On the first floor is the great hall, which leads to the different courts. It is approached by a staircase ornamented with marbles, and it is surmounted by a dome, the panels of which have been painted by Mr. G. MOIRA. The pendentives represent the four cardinal virtues—Justice, Prudence, Mercy, Charity—which have been carved by Mr. POMEROY, A.R.A. The lunettes in the adjoining hall have been painted by Sir W. RICHMOND and Mr. MOIRA. The stained-glass windows further increase the pictorial effects. There are four courts and they are panelled with oak. There are separate entrances for judges, counsel and the public. On the second floor are rooms for committees, counsel, the press and clerks, while on the third floor are kitchen and other offices. The Sessions House is an important addition to the architecture of London. It adds to the interest of the great thoroughfare from the west of London to Cheapside, which by some is considered at least equal to the thoroughfares through the Strand and Fleet Street.

REREDOS, CHURCH OF ST. PETER, HORNSEY.

THIS is a sketch for the completion by painted decoration of the reredos of St. Peter's Church, which was illustrated in our issue of January 26 of the present year. The drawing, which was exhibited in the Architectural Room of the Royal Academy, has been prepared in collaboration by Mr. F. G. CHRISTMAS, of St. Oswald's Studio, West Brompton, and Mr. J. STANDEN ADKINS, the architect of the church.

JOHN EVELYN AND WOTTON.*

JOHN EVELYN, whose beautiful home we are privileged to visit to-day by the courtesy of Mr. John Harcourt Chichester Evelyn, M.A., commences his famous "Diary" with these words:—"I was borne at Wotton, in the county of Surrey, 31 Oct., 1620, after my father had been married about seven years, and my mother had borne him two daughters and one son, viz. Eliza, 28 Nov., 1614, Jane, 16 Feb. 1615, George, 18 June 1617. They had another son after me, Richard, born 4 Dec. 1622." He died February 27, 1706, and thus lived through the times of Charles I., Oliver Cromwell, Charles II., James II. and William. The diary opens with a character sketch of his parents. His father, Richard Evelyn, was a man of retiring disposition, and paid, in order to avoid receiving the honour of knighthood, "the somme of fifty pound." "Wotton, the mansion house of my father," he says, "left him by my grandfather (now my eldest brother's), is situated in the most southern part of the shire, and tho' in a vally, yet really upon part of Lyth Hill, one of the most eminent in England (993 feet) for the prodigious prospect to be seen from its summit, tho' by few observed." He goes on to say that twelve or thirteen counties may be seen from it, with part of the sea on the Sussex coast, on a serene day, and describes the house in terms as applicable at the present time. "The house is large and ancient, suitable to those hospitable times, and so sweetly environed with those delicious streams and venerable woods, as in the judgment of strangers as well as Englishmen it may be compared to one of the most pleasant seates in the nation, and most tempting for a great person and a wanton purse to render it conspicuous; it has rising grounds, meadows, woods and water in abundance." He tells us that he will say nothing of the "ayre," because the pre-eminence is universally given to Surrey, and after further dilating upon the incomparable advantages of the mansion and its neighbourhood

coffee, a custom which did not come into England till thirty years after. In 1639 he began to travel in his own country, and favoured the towns of Bath, Bristol, Cirencester, Malmesbury, Abingdon and others. In the same year his younger brother joined him at the University, and in 1640 they took rooms in the Temple. Evelyn's father died in this year, and was buried in the church at Wotton, near his formerly erected monument, with his wife. In 1641 he saw the execution of Strafford, and had his portrait (now at Wotton House) painted by Vanderborcht. Then he started his continental travels, embarking at Gravesend and beginning with Holland. He visited Leyden, Rotterdam, Delft and The Hague, describing them with such minuteness that we to-day can picture many scenes which he saw, so little have parts of Holland altered in the course of 200 years. Then he went to Belgium, to "Sweete Antwerp" and to Brussels by water, and then to Ghent, with its memories of John o' Gaunt, to Bruges and Ostend, and then home again to his lodgings in the Temple. He was now twenty-one years old, and paid a visit to his brother at Wotton, and spent his time for a while studying a little but dancing and fooling more. Then he went afield to see more English towns—Chichester and Winchester, Hatfield House, Hertford, and "His Majesty's house and gardens at Theobalds, since demolished by the rebels." Then he saw Cheapside Cross demolished, and as the rebellion against King Charles was beginning to gain strength, he desired to possess himself in some quiet if it might be in a time of so great jealousy, and built by his brother's permission a study, made a fishpond, an island and some other solitudes and retirements at Wotton, which gave the first occasion of improving them to those water-works and gardens which afterwards succeeded them. Again on the move, he went to France and Italy, and for four years travelled in those countries, recording all he saw in a most appreciative fashion, and showing rare archæo-

pays a generous tribute to "the present possessor, my worthy brother, and his noble lady." Under the date 1624 he commences the personal portion of his "Diary" by telling us that he was not initiated into any rudiments till he was four years of age, and then he was instructed at the church porch of Wotton by one Frier, adding that he perfectly remembered the great talk and stir about the Spanish ambassador, Count Gundamar, and his duties in relation to the proposed match between the Prince and the Infanta of Spain. Then in 1625 he was sent to Lewes, where he passed his childhood, and in 1626 had his picture "drawn in oyle by one Chanterell, no ill painter." He lost his eldest sister in 1634, and his mother in 1635, and both were buried in Wotton Church, "in our dormitory joyning to the parish church of Wotton." Evelyn was admitted to the Middle Temple *in absentia*, and while still at school; leaving school in 1637 he went to Balliol College, Oxford, where his tutor was the son of the rector of Ockham, Surrey. His well-developed faculty of observation and annotation at once appears, for he records under this date the coming to the University of Nathaniel Conopios from Greece, a man who afterwards became Bishop of Smyrna, and he records that this man was the first he ever saw drink

logical and architectural knowledge for those times. In Paris he was married at the end of this tour, and, being called into England, left his wife in good hands while he returned to Wotton. At Hampton Court he had the honour to kiss His Majesty's hand, and gave him an account of several things he had in charge, "he being now in the power of those execrable villians who not long after murder'd him." Sayes Court, in Deptford, which afterwards became his property, received a visit from him, as did old Bartholomew Fair. To Godstone he went to see Sir John Evelyn, where was also Sir John Evelyn of Wilts, and, as he says, "I took leave of both Sir Johns and their ladys." In 1642 he went to see one Mark Antonio, an incomparable artist in enamelling, who affirmed his knowledge of a man who had arranged that one pound of lead should obligingly be converted into a quarter of a pound of gold. In this year he made up his mind to stay at home, and went to Deptford with the object of settling down. He went with his brother to Wotton to give him what directions he was able about his garden, which he was desirous of putting into form. He was to remove a mountain overgrown with huge trees and thicket, with a moat within ten

* A paper read at a meeting of the Upper Norwood Athenæum on August 25, by Mr. Charles Wheeler.

yards of the house. They found that by digging down the mountain and flinging it into a rapid stream, it not only carried away the earth, but filled up the moat and levelled that noble area where now the garden and fountain is.

His brother, the owner of Wotton, died in 1699 at the age of eighty-three. He left one son who died at an early age. His brother left John Evelyn his library and pictures of his father and mother, &c. In May 1700 he left London to take up residence at Wotton as owner of the estate, removing the rest of his goods from Sayes Court. He died in London on February 27, 1706, in the eighty-sixth year of his age, and was buried in Wotton Church. His wife died in 1709, aged seventy four.

VENICE UNDER REPAIR.

THE Venice correspondent of the *Morning Post*, in a communication of the 21st inst., writes:—

More than four years have now elapsed since the Campanile fell, and at the present moment the highest part of the new tower is not more than 18 feet above the surface of the pavement, there thus remaining 304 feet to be constructed before it reaches the elevation of its predecessor. Much time was necessarily devoted to the foundations, which have been laid with the utmost care, and which were finished last year, but since the beginning of July not a single stroke of work has been done at the tower, nor is there any probability of its immediate resumption. The cause of this stoppage is the opposition which has arisen to the construction of the tower and the consequent appointment of a Commission to inquire into and report on the work done. Pending the final report of this Commission—a preliminary report has already been issued—all work has been suspended.

The objections raised to the new tower are mainly four. Critics object that the bricks employed contain a large percentage of sulphates which exude through the sides and form a white deposit on the outside of the tower. This phenomenon is obvious to all who examine the building; I have myself rubbed off a layer of white deposit from some of the bricks. But people who have lived many years in Venice point out that all, or most, of the bricks used in the Venetian buildings are discoloured in the same way, and that it does not in the least follow that the bricks of the new tower will crumble away any more than that the white efflorescence will affect the mortar in the interstices and tend to dissolve it. From the part of the tower which is exposed to the sun the white powder has entirely disappeared; it is only on the shady side that it is still to be found. The second criticism is directed against the mortar, which is of the nature of Portland cement. It is argued, not without some reason, that pozzolana, the most binding and most durable of all mortars, should have been employed for a work which is intended to defy the ravages of time. Roman architects are wont to compare the extraordinary durability of the ancient Roman buildings, in which pozzolana was used, with the greatly inferior powers of resistance exhibited by Mediæval buildings at Venice and elsewhere, in which other cements were adopted. But there was this objection to the use of pozzolana for the new Campanile, that though it is not more expensive than the cement actually employed, it takes twice as long to set, and therefore the tower would have occupied much longer to construct—a feeble argument in the case of a monument which should be *ære perennius*. From the materials used the critics then turned their attention to two details of construction. It will be remembered that the new Campanile was to be an exact copy of the old. But it does not seem to have occurred to any one to ask the simple question which particular period in the old Campanile's long life was to be copied. Some not unimportant details of that venerable building varied with age. For example, it was originally constructed with five steps at the base, and the new tower faithfully reproduces these five steps. But at the time when the old Campanile fell and for at least a hundred years before, owing to the rise in the level of the Piazza, two of the original five steps were below ground and only three were visible. Therefore, argue the critics with truly Byzantine subtlety, the new tower should, like that which we were always accustomed to see, have only three. Finally, the inside of the old tower was supported by eight pillars, while there are only four within the new, and this deviation from the ancient model has naturally not escaped the notice of the opposition.

"The Opposition" is, indeed, the right word to use, for politics, as they are understood in Venice, enter largely into

this question. I do not mean that the supporters of the Triple Alliance are necessarily advocates of five steps, or that pozzolana instead of Portland cement is an essential item in the Irredentist creed. The fact is that politics here are largely a question of local persons, *campanilismo*, as the Italians call it, which very appropriately settles round the Campanile. The defenders of the new tower maintain that full and elaborate plans and models were publicly exhibited before the work began; that none of the present criticisms were then heard—though there was a party which was opposed to rebuilding the tower at all—and that now, when nearly a year has been spent in building the first section, the then silent critics have opened their mouths and have caused the suspension of the works, perhaps as a preliminary to a fresh start being made from the foundations. Professional jealousy is perhaps not more acute in Venice than elsewhere, but I have heard it said that if at the outset the authorities had put every Venetian architect on to a committee for the Campanile these acute rivalries would not have arisen. Everyone's ambition would have been satisfied and a small sub-committee chosen from the larger body would have really done all the work. Such expedients are used, as everyone knows, by modern British Prime Ministers; eighteen or nineteen people with "claims" form the Cabinet; three or four of them actually govern the country. As it is, were the Campanile resumed on the present plan to-morrow, three years more must elapse before Cook conducts his first tourist to the top.

Happily, the more celestial minds engaged in the task of saving St. Mark's from destruction are not torn by these professional feelings. Except in the case of the workmen employed in the Roman Forum, I have never seen men so devoted to their work from sheer love of it as those employed on St. Mark's. The greatest of all Italian churches inspires even the humblest mason with something of that sentiment which the ancient Athenians felt for the Parthenon, which an English verger sometimes shows for the grey fabric which dates from the dim days of the Saxons. "No expense could be too great to preserve the basilica of St. Mark's," a Venetian architect observed to me, and the speaker was a man whose whole life centres in that gorgeous fabric. But long years must elapse before the last piece of scaffolding is removed from the church of the Evangelist. At the present moment work is being actively prosecuted in no less than four separate points of the building, while at two others the preparations for repairs are now made. First and most noticeable is the task of making good the fissures that have appeared in the atrio, or vestibule. The part to the right of the main entrance is now entirely closed to the public, and there the engineers have had a difficult problem to solve. The great columns which stand there have been split by the oxidation of the iron clamps inside the base and at the top of each, and it has been necessary to raise the capitals, which fortunately have nothing resting on them, by means of a crane, extract the oxidised iron, replace it with bronze, lift up the whole column for the same operation at its base, and then replace each column and capital in its former place and at its former angle, slightly out of the perpendicular. Two columns have already been treated successfully in this way. In a fortnight's time another pair will be taken in hand. Inside, right up to the roof, there now stands a vast and massive scaffolding, four storeys in all, made of American pitch pine, which looks as if it were meant to last for ever. The roof was cracked in this part, and the mosaic has consequently been partially removed. Complaints are made in Venice that this operation is frequently misunderstood abroad, and it may therefore be well to describe how it was accomplished. An impression of the mosaic is first made on specially-prepared paper—*carta da fillre* as it is technically called—which, being porous, receives an exact impression of each separate piece of mosaic. This paper is then coloured with the precise colours of the original and serves as a pattern. The mosaic is then taken off in strips of about 2 or 3 feet in length and is laid on the wooden floor of the scaffolding in exact order just as it was on the wall of the basilica. All the mosaics of the Tribune of the Patriarch, for example, which had begun to fall, are now lying in this position. The architects claim that when a wall has been repaired and the mosaic replaced it is impossible to distinguish any difference between that which has never been moved and that which has been temporarily taken off. Certainly an untrained eye finds it impossible to say where the division between the two begins.

From the vestibule we pass to the above mentioned

Tribune of the Patriarch, now stripped of its splendid dress. Here one of the arches has given way, part of the Byzantine cornice has slipped about an inch, and the circle of the cupola has been so displaced as to be now an ellipse. Emerging through a dark and narrow passage on to the roof and scrambling over the leads we find that the men are at work on the central cupola, where more than half of the woodwork and the lead which covered it has to be renewed. At the cupola of the Madonna the mosaics have been already replaced, but the work of strengthening the supports of the cupola is not yet finished. More serious will be the repairs at the corner of Sant' Alipio, which faces the Piazzetta dei Leoni, and which needs drastic overhauling, as its walls are in a bad state. The last item in the present programme is the repair of the dome of the Apocalypse, the plans for which are complete. There is no lack of funds for St. Mark's. The Austrians endowed it with 2,040*l.* a year, and for many years there were large savings out of this income which are now available.

ARCHÆOLOGICAL EXCAVATIONS.

THE recent heavy rains will bring some excavations to a close earlier than was intended, says the *Manchester Guardian*, but already the work is practically concluded on a number of sites. The annual meeting of subscribers to the excavations at Caerwent was held last week, when a party visited the site under the guidance of Messrs. Ashby & Martin, who are directing the work there. Much time has been occupied this year in filling in the part already examined; the (so-called) amphitheatre, however, is to be left uncovered and railed in. The southern gateway has been nicely cleared, and is one of the finest specimens left in the country. Twenty-eight large houses have now been excavated at Caerwent. The main result of this year's work has been the uncovering of the foundations of the house marked VII. N. on the plan, only a corner of which had been exposed previously. This house—not by any means the largest found—contains about sixteen rooms. In the course of excavating it the workmen came upon a large urn or amphora, in perfect preservation, containing curiously a number of smaller vessels, some decidedly Roman, others having the appearance of British ware. Another fresh object in the museum is the case filled with shoes obtained from the bottom of one of the many wells which have been cleared out. As mentioned last year, not a single marked tile has been found in the excavation of the city; recently, however, a fragment of brick has turned up bearing the letters "AUG," which are evidently part of the stamp of the Second (Augustan) Legion, which occupied the neighbouring station of Caerleon. This year a considerable amount of attention has been paid to the excavation of the vallum, which stands some distance within the wall, and on the berm of which the wall was apparently (subsequently) built. The bank is of beaten clay and of great size; the wall which now stands between the vallum and the fosse is 9 feet thick, and on the south side of the city it still stands nearly 20 feet high. The inscription on the base of a small statue dedicated to Mars has now been made out as follows (missing letters are supplied):—

"Deo Marti Leno sive Ocelo Vellauno et numini Augusti Marcus Nonius Romanus ob immunitatem colliqui donum de suo dedit Glabrio et Homulo consulibus ante diem x. Kalendas Septembres."

The date is thus fixed as August 23, A.D. 152. Lenuis, it seems, is a common name of Mars in Rhenish inscriptions, while Ocelus has been found in one inscription at Carlisle. It is a Celtic word, probably the name of a British god here identified with Mars. Tessellated pavements are still found, and the last printed report of the excavations contains a lithograph of a fine mosaic pavement found in room 36 of house No. XII.

Mr. Ashby calculates that the new area on which Lord Tredegar has given permission for excavations to be carried out, and which covers some four or five acres in the centre and north-eastern part of the city, will furnish work for four more years at least.

During the summer the committee of the Classical Association have taken in hand the removal of the many tons of earth and stone which still encumbered the headquarters building at Melandra, and there was some hope that the vault or pit which has several times been

found in such buildings might be discovered. To Mr. Hamnett belongs the credit of finding the first traces of buried remains. In the north-east corner of the courtyard he came across a pit containing a great quantity of building stones, beneath which was concealed, with other remains, the upper part of an altar. This is the first altar found at Melandra. On comparing the sculpture with that of the many altars found along the great wall at Chester, at Carlisle, or elsewhere, it is perhaps safe to say that the Melandra fragment shows as good workmanship as any. So far only the top of the altar has been found; this is cut out of a single block of stone rather more than two feet long and nearly a foot thick. On the upper face are the two scrolls, ornaments or bundles—whatever their significance may be—which are such a common feature of the Roman altars found in Britain, and which appear to correspond to the scrolls found on the altars of the Greeks. The appearance is that of a bundle of twigs bound together with a rope in the centre. One scroll is perfect, the other is broken.

Perhaps the most remarkable case on record of the discovery of buried altars on the site of a Roman fort is that of the well of the goddess Coventina at Procolitia, which will at once occur to those who are familiar with the wall of Hadrian. This well, which was cleared out in 1876, was found to contain twenty-four Roman altars, nearly 20,000 coins, a massive votive tablet, vases, rings, beads, brooches, and many other relics. It is generally supposed that the altars were thus hurriedly buried when the fort was abandoned.

ROTHERHITHE TUNNEL.

THE members of the Society of Engineers, on the 19th inst., visited the Rotherhithe tunnel now in progress. This work, which is being carried out by the London County Council, consists of a carriage and footway tunnel with approaches, commencing in Lower Road, Rotherhithe, and terminating in Commercial Road, Stepney. The total length is 6,883 feet, of which 2,020 feet is open approach, 1,122 feet cut and cover and the remainder 3,741 feet tunnel lined with cast-iron and concrete. There are four vertical shafts, one on each bank of the river near the water's edge and one at each end of the iron-lined tunnel further inland. These shafts vary from 70 feet to 100 feet in depth; they are each 50 feet diameter inside, the sides consisting of two steel skins, 5 feet apart, with the intervening space filled with concrete. Openings are provided in the shafts for the tunnel; these openings are temporarily closed while the shafts are being sunk and until the tunnel is connected up with them. The under-river portion of the tunnel is about 1,500 feet long between shafts and crosses the river diagonally in order to clear the entrances to the Surrey Commercial and the London and India Docks, which lie opposite each other at this point of the river.

The tunnel proper is circular in section, the outside diameter of the cast-iron lining being 30 feet, with a thickness of metal of 2 inches under the river and 1½ inches elsewhere. The lining is put together in rings each 2 feet 6 inches wide, and composed of sixteen segments with a key-piece. The rings are bolted together by means of bolts through the internal flanges, which have a depth of 14 inches. These flanges will be hidden when the work is completed by the concrete lining, which will have an internal diameter of 27 feet. The faces of the iron at the joints are all machined for a width of 12 inches and the segments fit metal to metal. The remaining 2 inches at the internal edge of the flanges are recessed for caulking with lead and rust cement.

The tunnel is being constructed by the shield system under compressed air. A small pilot tunnel 12 feet 6 inches external diameter was first driven across the river, and it is being followed by the main tunnel. The strata met with are known as the Woolwich and Reading beds, and consist chiefly of clay with beds of sand and shells, overlying a bed of marl or rock of a chalky nature. Below the last occur a compact bed of pebbles and a thick bed of sand.

The cut and cover portion of the work consists of a brick barrel 1 foot 10½ inches thick, surrounded with concrete. The internal diameter of the brickwork is 27 feet, the same as in the case of the concrete lining in the iron tunnel. The surface of the roadway will be 5 feet below the axis of the tunnel in order to obtain full advantage of the available width. This will allow of a 16-foot carriage-way and two

4 feet 8½ inch footpaths. Below the roadway the section provides for a subway which can be used for gas and water mains, electric cables, &c.

In the case of the open approach the section consists of concrete retaining-walls with battering face, surmounted by a brick parapet. A concrete invert fills the space between the footings of the side walls, and upon this the roadway is to be placed. The tunnel faces on each side of the river are built of red Aberdeen granite surmounted with a massive granite parapet, the surface of the whole being polished. Both the cut and cover portion of the tunnel and the open approaches are made watertight with asphalt. At one point, viz. on the south side of the river, the tunnel approach crosses the East London Railway. The crossing occurs at the Rotherhithe station, and it has been necessary to cut away a portion of the railway tunnel, build new retaining-walls and carry the new roadway across the station platforms and the rails by means of a girder bridge. At the present time the approaches and cut and cover portion on the south side of the river are nearly completed. All the shafts have been sunk, and the tunnel has been driven rather more than half-way across the river. On the north side of the river the open approach and cut and cover portion of the work are in progress. An extensive plant for air-compressing and hydraulic purposes has been installed, including six air-compressors capable together of dealing with 1,000,000 cubic feet of air per hour. About half that quantity is at present being delivered into the tunnel. The contract was let to Messrs. Price & Reeves early in 1904, and the work is expected to be completed in 1909. The cost of the work will be about 1,000,000*l*.

The engineer-in-chief is Mr. Maurice Fitzmaurice, C.M.G., M.Inst.C.E., chief engineer to the London County Council, the resident engineers being Mr. E. H. Tabor, M.Inst.C.E., assisted by Mr. A. G. Drury, Assoc.M.Inst.C.E., member of Council of the Society, by the latter of whom the visitors were received and conducted over the works.

MEDIÆVAL COLLEGE LIFE.

IN the *Glasgow Herald* are interesting articles on "Four Centuries of Academic Life" by Mr. R. S. Rait. In the course of the first article relating to the studies in King's College, Aberdeen, he says:—

Immediately after obtaining from the Pope a Bull for the institution of a university in 1495 Elphinstone took steps to found a fully-equipped college to carry on the work of teaching the ignorant North. He provided endowments for students and teachers in arts, in medicine, in canon and civil law and in theology. He built a noble college, whose beautiful chapel still survives, with its Crown Tower, similar to, but to a Northern eye more beautiful than its sister at St. Giles's. The fabric of the college was not completed when the bishop died. As became a Mediæval prelate, his first care was for the House of God, and he left his successors to complete the range of dwelling-rooms for his masters and students. It is, however, clear from our records that temporary provision of some kind was made in his lifetime, and that full academic residence and discipline began exactly 400 years ago. From the documents that have come down to us we can reconstruct the daily life of the members of Elphinstone's completed college; we can picture to ourselves the rooms in which they slept; the hall in which they ate has not yet vanished from living memory, and their twentieth-century successors still worship God, though in different forms, in the chapel which held so great a place in their lives.

The life of the Mediæval King's College student is sometimes described as "monastic." Life within the walls of King's was not in any sense monastic; it was governed by rules and regulations just as is the life of an English public schoolboy to-day, and these rules and regulations laid more stress upon religious ordinances than is done now in even Roman Catholic schools. Any list of the numerous religious services would be misleading, because, while the canonical hours were duly kept in the chapel, and many Masses were said every day, most of these observances were the duty of the chaplains, and did not affect the undergraduate student or his teachers. At four o'clock in the summer and five in winter one of the Elphinstone's bells in the Crown Tower would ring out, and the principal would rise from his curtained feather bed and dress by the meagre light of his hanging brass chandelier; his colleagues and the students would soon emerge from their humbler dormi-

tories, known by the names of the planets and the constellations. Woe to the laggard who tarried too long in "Jupiter" or the "Ram," for by the sixteenth century the Mediæval student had lost all his early rights, and the later college founders in England and Scotland knew of only two remedies for lateness and similar crimes—fining and the birch. Fining meant for the bursars the mulcting of a portion of their food, and as this was clearly inadvisable the other alternative came more and more into operation in the sixteenth and seventeenth centuries. After Mass some hours' work would follow, the teacher dictating some of the Latin translations of Aristotle, with the popular commentaries of the day, illustrating the use of the globes, explaining the method of the calendar, or, in the case of the Bajans, enforcing the rules of the Latin grammar of John Vaus, the first King's College professor of humanity. Graduate students would attend prelections in theology, in medicine, or in law, according to the profession of their choice. The tedium of the long day was broken by religious services, by meals and by recreation. There were probably two meals in the day, one about 10 A.M. and the other before lights were put out and the gates closed at nine in the evening; but if human nature was what it is, there were probably private raids on the kitchen in the course of the long morning hours, where benevolent cooks could give the hungry youths some of yesterday's scraps. The regular meals were substantial enough. We read of purchases of beef and mutton, fish and partans and eggs, white bread and oatbread, best ale and second ale.

All conversation had to be carried on in Latin or French, not only at meal times, but also during hours of recreation. The only recognised form of recreation seems to have been walking, but doubtless simple games of various sorts, including probably football, were winked at by the authorities or engaged in surreptitiously. On Saturdays there were no lectures, and the day's work took the form of the characteristic Mediæval disputation. The whole college met in the public school, a thesis was proposed, and was impugned or attacked by one student and propugned or defended by another, while the audience followed the arguments and learned the methods of debate. On Feast days (*i.e.* Sundays and Saints' days) there was neither lecture nor disputation, but everyone attended a larger number of chapel services, and there was more time for recreation and for conversation—even in the vernacular. We can picture the High Masses on great days in the chapel, then adorned with all the requisites for the splendid ritual of the Roman Church. We can still point, in the magnificent oak screen, the sole survivor of Elphinstone's furnishings, to the seat occupied by successive principals of the college (abandoned in recent times for a much less appropriate place). Each member of the foundation had his proper stall, and the details of the arrangement are known to us.

When Elphinstone drew up his scheme for the life and work of King's College the Mediæval system was already tottering to its fall. The Reformation, alike in religion and in education, came late in Scotland, and it came thorough. The subjects taught and the methods of teaching them were alike changed in the universities, as the doctrines had been changed in the churches. There was, of course, a strong opposition to these innovations, and nowhere was this opposition so strong and so persistent as in Old Aberdeen. Despairing of reforming King's College in the light of the new ideas, George, fifth earl marischal, adopted the bold expedient of founding a rival university in the city of Aberdeen, and from 1593 to 1860 the two institutions were separate corporations, unconnected in any way. The older college meanwhile passed through stirring times. There came a day when its Roman Catholic principal armed the students and successfully defended the chapel against a Reformation mob bent on the plunder of the temple of idolatry. There came a day when that principal and those of his colleagues who remained loyal to the old Church were deposed from their offices, and the earl marischal made his unsuccessful attempt to persuade the college to accept a new foundation and to abandon the study of Aristotle for that of Homer and Horace. This new foundation tried to abolish not only the Professor of Canon Law, but his colleague the Professor of Medicine, though it is difficult to see why the most zealous Protestant should have considered his office unnecessary. The accession of James VI. to the English throne, and the consequent establishment of Episcopacy in Scotland, gave a partial victory to the conservative party, but, curiously enough, they used it to abandon philosophy for the humanities, which were beginning to be distrusted

by the more extreme Presbyterians. At the outbreak of the Civil War Marischal College was so far in line with the tenets of its founder that it escaped any drastic treatment at the hands of the victorious Covenanters, but the Episcopal principal of King's College shared the fate of his Roman Catholic predecessor. A decade later another turn of fortune's wheel placed the Cromwellians in power, and they proceeded to depose the orthodox Presbyterian whom the Covenanters had appointed, and to replace him by a man with distinct tendencies towards Independency. John Row, who thus became principal, was a man of considerable distinction, and in his short tenure of office he showed the qualities of a firm and energetic ruler. It is under Principal Row, in the middle of the seventeenth century, that we have our next complete glimpse of the internal life of the college.

The hour for morning chapel is now half-past six o'clock in winter and six in summer—a decline in virtue from Elphinstone's Spartan rule. The roll was called before chapel—"Let no one answer 'Adsum' for another, *est enim splendidum mendacium*." The punishment for this kind of "lying in state" is not specified; about this date the use of the birch became much less frequent, though there are still references to it. But the whole record of Principal Row's Cromwellian administration leaves the impression that he was a bold youth who adopted Sydney Smith's morning rule that "one good turn deserves another," and so failed to answer his name at morning prayers. After chapel (there is no hint yet of any morning meal) all betook themselves to the public school or to their public lecture-rooms to be examined on yesterday's work and to receive the prelections for the day. There was a short interval at ten o'clock, when there was another roll-call, and at eleven they all trooped in again to the public school to learn by heart the morning's lecture, which had been carefully dictated. At noon came dinner, for which Principal Row promulgated an elaborate code of rules. The whole duty of the polite student is carefully prescribed. He is to take his proper place at the table with clean ungloved hands and with a bare head. He must have a cheerful countenance and help himself to salt with his knife and not with his hands. He will grasp his food with three fingers and use his knife before his teeth. When his fingers become soiled he will not lick them, but wipe them with his napkin, and he will not cut the table with his knife. He will order himself reverently towards his pastors and masters, and will replace bones on his plate or drop them on the floor; if he throws them at his neighbours he must not complain if he is whipped. He will sit erect and keep his feet still. He will drink sparingly and always wipe his lips after he "drunken his draught." He will take what is nearest him and give his neighbours their turn. Above all, he will remember that he eats to live and does not live to eat. His conversation is to be unto edification; but there cannot have been much of this if the rule was observed which ordered the reading of profane history during dinner and of sacred history at supper.

The roll was called again at two o'clock, and on three afternoons a week work followed. On other three afternoons excursions were made to the links for recreation. Even in hours of recreation conversation in Scots or English was forbidden. "Let everyone's speech be in Latin, Greek or Hebrew. On account of the ancient alliance between the French and the Scots, our Foundation adds French. But let all avoid the vernacular and attempt to talk *Latine*, and not merely *Latine*, but *Latinus* and *Latinissime*." One can scarcely imagine this rule being carried out on the links; if it was, it must have produced some rare specimens of dog-Latin, the prevalence of which the rules deplore. All games of chance or cards and all dangerous games were prohibited. In the freedom of the links the students might indulge in games of ball; but all such games and all throwing of stones or snowballs was strictly forbidden within the walls of the college. On afternoons when recreation was not permitted, the links were patrolled by a senior student, who searched for truants and conducted them with ignominy to the sub-principal. On lawful afternoons games on the links lasted from two o'clock till five, when the shades of the prison-house again closed. At six came evening prayer, followed by an exposition of Scripture. Supper, followed by metrical psalms, was at eight; and the college gates were closed at eight in winter and at nine in summer. The routine of Saturdays differed from that of other week-days, for the ancient practice of disputation still survived. Thus the college year went by from the beginning of October to the middle of June, when the students dispersed for the vaca-

tion, the only holiday in the year, now that Christmas and Easter and Saints' days were regarded as superstitious observances. It was in keeping with the austerity of the times that Principal Row made an effort, fortunately unsuccessful, to abolish the red gown and substitute for it one of a black or dark colour; and to wear a blue cap was also an offence involving an ominous visit to the sub-principal.

DESIGN AND THE CHOICE OF MATERIAL.

WHAT would be thought of a goldsmith who laboured long and lovingly at a hoped-for masterpiece, and then left it for the decision of the purchaser whether the work should be used as a setting for brilliants, pearls or jade? Or, to give a more commonplace instance, should we expect a woman to choose a pattern for a gown and then leave to the determination of cost and expediency whether the material should be silk, lawn or calico? Such examples as these of the utter disregard of congruity between design and material are almost unthinkable. But every day, writes Mr. F. W. Hoyt, in the *American Architect*, architects of the highest rank and of the utmost refinement of taste are called upon to confront just such a condition. They furnish a design for some great building that might be their masterpiece, and serve to keep their names alive in the annals of their art. The design is approved and calls out delighted comment. Then it is handed over to the specification-writers, and the estimators are called upon to furnish "alternative bids" in granite, marble or limestone. The man who gives the commission, or the building committee if it be a public structure, decides by the item of cost, the time-limit of construction or even through "wire-pulling" and "influence," which material shall be used to embody the architect's conception. No one would deny that the architect's opinions sometimes carry great weight, and that a few builders (using this term to designate those for whom the structures are to be erected) are guided by considerations of art and fitness. But still dollars and cents and days and weeks play an extremely important part in all building operations. Hardly a day goes by without contributing an instance of some notable building, originally contemplated in one material, being changed to another through influences of expediency rather than congruity. That American architecture has reached a high plane under so manifest a drawback is surprising. It is certain, however, that our architects will never show the full fruition of their genius until they are freed from this incubus; until they are allowed absolute discretion in the adaptation of design to material.

How much the artistic effect of the great buildings of all time depends upon the exquisite adaptation of material to design is familiar to every student of architecture. We may be sure that the happy combination was not secured by chance, and that the buildings were not conceived and planned in ignorance of the structural material that was to be used. Does anyone believe that those who reared the Parthenon would have wrought in the same fashion if granite or sandstone had been the only quarry product at hand? We may go even further, and ask to what extent the architectural art of the ancient world was inspired and modified by the nature of the building material that was available. It is a fruitful subject for investigation. Greek and Egyptian architecture and sculpture are as far apart as the poles. We are taught that this is because of the nature of the people, the state of their civilisation, their religious beliefs, their philosophy of life, &c. But has there not been an ignoring of physical conditions? The Greeks wrought in free-working stone, and had the brilliant marbles of Pentelicus, Paros, Thasos and Naxos to call out their most delicate fancies. The Egyptians, on the contrary, worked largely in the sombre and intractable granites, syenites and porphyries. Who can tell what modifications there would have been in the architectural styles of each of these peoples if there had simply been a substitution of the rock formations of one country for those of the other?

In a general way there is a widespread recognition of the fitness of various stones for certain purposes. The judgment of the ages has fixed upon granite for structures in which the keynote is solidity, strength and dignity. Marble is the material necessary to carry out the Classical style in its purity, while any form of light-coloured freestone is suitable for highly-decorated and Flamboyant architecture. Every architect naturally seeks to work within these bounds and limitations, unless he is

hampered by the "alternative bid" system. But it is when he goes deeper than these general principles, and gives close and detailed study to the capabilities of every variety of stone that the architect secures the most perfect result in the carrying out of his designs. He recognises that half a dozen qualities besides mere manual ease in carving have an important bearing on the finished ornamental work. He rejects a hard, tough granite for a façade requiring a mass of delicate carving, not only because the cost of cutting would be prohibitive, but also because the nature of the stone is such that, even if the work were done, the effect would be wholly unsatisfactory. The qualities in a stone that must be taken into consideration in judging its adaptability for particular work are texture, hardness, life (not durability, but liveliness) and colour, the above enumeration being, perhaps, in the order of their importance. The word "texture" (at first glance seemingly inappropriate in this connection, as it comes from the Latin *texere*, to weave), as applied to stone, means the manner in which the various constituent mineral particles are united, and incidentally takes into account the size, shape and nature of the individual particles. No science has a more extensive and confusing terminology than geology. Scores of terms are used to describe the minute variations of rock structure, but it is enough to consider the building stones under the broad classification of crystalline and fragmental. The crystalline structure of the granites and limestones varies almost infinitely. We roughly distinguish these stones as fine, medium and coarse-grained. For the purpose of considering their fitness for architectural use, it is desirable to employ two more scientific terms. A saccharoidal formation is that in which the grains and structure are similar to loaf sugar. This is common in the crystalline limestones classed as marbles. Porphyritic rock is that which consists of a compact or fine crystalline ground mass, through which are scattered larger crystals. Granite very frequently assumes this formation. It needs no argument to show that the saccharoidal structure is most suitable for work where the *motif* of the carving or decoration is delicacy and grace. On the contrary, these qualities would instantly be sacrificed if an attempt were made to render them in a stone of porphyritic formation. Here the only qualities that can be expressed are strength and solidity, and the decorative features must be conceived along the line of boldness and vigour. To carry the idea still further, these features of a stone have weight, even in plane flat surfaces. If a fine-grained, pure, white marble is used for wide, unbroken wall-spaces, and is left in the smooth, sand-rubbed finish so much affected, the result looks like a bit of plasterwork or a confection by a caterer wrought in sugar. This is in large measure obviated if the stone contains the blue veins and cloudings natural to a true marble. These are generally barred out, because there is a craze for "white" buildings. The effect can also be avoided by a tooled finish, but the better way is to make use of a marble of coarse crystallisation. In contradiction to this dictum, someone may point to the Classical buildings of Greece, in which the fine-grained Pentelican marble was used for large, smooth surfaces. But the Grecian marble has a distinct cream tint, and there is a peculiar translucent quality that we cannot match in any of our stones. Besides, who shall say that it was not a desire to avoid a plaster or sugary effect that led the Classical builders to make so free use of pigments in staining stonework?

Stone of very coarse grain or of porphyritic formation does not give any appearance of dull uniformity in unbroken surfaces, and its use is suggested in all such cases where possible. But it is completely out of place where it is often seen, in buildings made up of small wall-spaces like narrow window-piers. Here it looks as if shorn of its most vital quality, strength.

The second variety of rock formation to be considered in this connection is the fragmental, as this manifests itself in the granular or oolitic form. The granular structure is that of all the common sandstones. In some of the sedimentary rocks the grains are so minute and the texture of the stone so compact that there is scarcely any appearance of granular structure. Stone of this nature, however, is so rarely used in the building trades that it may be dismissed from further consideration. The oolitic formation is most familiar in the Indiana limestone, and the trade application of the term is limited solely to this and kindred varieties of stone. Most of the sandstones and oolites come within the category of freestones. The texture is nearly always fine and even, and consequently they are, in the main, suited for delicate and elaborate ornamentation, save

as there comes the modification of colour, to be spoken of hereafter. In the granular and concretionary, or oolitic structure, the constituent mineral particles are held together by a cementing material, which is dull of colour. Thus there is never the liveliness shown by the crystalline rocks. There is none of the play of light that comes from the facets of a crystal, and that is never completely lost, even though the exposed surface of the crystal be smoothed by the rubbing-bed. For this reason the natural treatment suggested is that ornamentation be carved in greater relief than in a crystalline stone, so that there may be the play of light and shade from without. It also suggests that in plane surfaces the stone always be tooled or left in rock-face, unless there is a warmth of colour. The ordinary greys, blues and buffs of freestone, if sand-rubbed, are as dull and lifeless as concrete, and the architect might better give the preference to the cheaper material. The pink, red and brown stones, however, are best shown in plane surfaces, smoothed, with sufficient moulding and simple ornamentation to prevent severity. In the very dark stones carving loses the greater part of its effect unless it is wholly in the round, like pinnacles, finials, crockets, &c., owing to the indistinctness of the shadows. Of course this is not true of the light reds and pinks. But all of the colour is due to the presence of mineral ingredients that tend to hasten disintegration if exposed surfaces invite the entrance of moisture. Besides, wise restraint is the soul of art, and rich body-colour and elaborate ornamentation rarely harmonise in architecture.

One quality of the freestones that particularly fits them for ornate and highly-wrought carving is difficult to put into words. This is not the mere ease of working, but the direct and delicate response to the chisel, so that the finished surface might almost be called the autographic record of the artisan. There is an individuality that can be had in nothing else save the finest of the marbles. This it is that makes it possible to carve architectural statuary in a stone that has little natural life, and yet that does not show a hard unfeeling result. One has but to glance at the many caryatides and atlantes carved in granite and limestone on our city buildings to see how the former stone yields in beauty and effectiveness to the latter for work of this nature.

In certain varieties of ornamentation it is particularly desirable to make the tool-marks plainly manifest. One of these is the Celtic pattern, and another is vermiculation. The reason for the desire to retain the tool-marks is that there shall not be too much regularity in the ornament, but that it shall look, in the first instance, as if the design were made separately by actual braiding and then applied; in the second case, the desire probably is to simulate the work of worms. When the ancient Celts used the braided-work for their famous crosses, they did not employ any of the fine native granites for the purpose, but rather the Irish limestone. This was not for ease of working, for it cuts as hard as many granites. It is a dense crystalline stone of a fossiliferous nature. It is a dark blue-gray in the fractured surface, but a peculiarity is that it tools almost white, and the light tool-marks never fade away to the original colour of the rock. A stone of an identical nature is found in the central part of New York State. The use of such a material would permit of artistic effects where a marked contrast is desired between the worked and the unworked surfaces.

Every city in this country can show scores of instances where no attention has been paid to the above very obvious limitations of structural stone. In few cases is the fault due to a lack of perception on the part of the architect. What chance had he to adapt his design to the material when at the time of drawing it he could not tell how much his patron would be swayed by questions of cost or time? He must either trust to chance that his design will find a fitting material or try a compromise with his artistic instincts, always a dangerous expedient. One of the handsomest and most elaborate buildings in New York has a profusion of ornamentation in the form of festoons and bosses, all rather ponderous and heavy in design. This was evidently conceived with the idea that it would not be ruined if carved in either granite or marble. As a matter of fact, the stone finally chosen was one of the most delicate and fine-grained of American marbles. The nature of the stone would admit of the most exquisite refinement in carving, and it stands out as an opportunity wasted. Another building has panels and spandrels filled with sculptured figures and the most delicate floral designs of the later Renaissance style. But it is in granite fortunately of a fine, uniform

grain and of light colour. It is a superb example of stone-carving in itself, but the figures especially have the hard, repellent look that must always follow any attempt to render the human form in a material which is not fully responsive to the chisel. The artistic effect would have been superior and the cost far less, if the design had been carried out in marble or any light freestone.

The above discussion of the limitations of the various stones used for structural purposes clears the way for a suggestion of the general principles underlying the adaptation of design to materials. There is no pretence that the matter is to be settled by the dicta of any man, and this claims to be nothing save a contribution to a subject that has been strangely neglected. Reduced to briefest form, I conceive the natural treatment of our building stones to be as follows:—For coarse-grained stone of light colour, bold and vigorous ornamentation, simple mouldings and large plane surfaces are most suitable. Fine-grained stone of soft and even texture, liveliness and light colour, calls for ornamentation of Classical delicacy and refinement, with flat surfaces tooled. Light-coloured freestones are most effective with elaborate ornamentation, carved in high relief, and with flat surfaces invariably tooled. All dark or highly-coloured stone should have rubbed or hammered surfaces and few and bold ornaments and mouldings.

Painters work with oils, water-colours, charcoal or pastel, but they never seek to override the limitations of their *media* unless they are faddists or seeking cheap sensationalism. Americans who commission architects should be forced to a realisation that the limitations of structural material are far more rigid. No considerations should be weighty enough to justify a disregard of them. Architects must be unfettered by sordid considerations. In the good time coming no finished design will be drawn, even at Government dictation, until the general nature of the structural material to be employed is irrevocably determined.

TESSERÆ.

Goltzius's Etchings.

THERE is a style of etching, which for the sake of distinguishing it from any admixture with the graver may be called the painter's style, which requires little besides the hand of a master, more than the knowledge of the character and form of the figure or group, and is in fact nothing more than the artist's drawing upon copper, which emanating from the mind of the painter often possesses a spirit and character equal to the first thoughts or the sketches of the master. In this practice most of the eminent painters indulged both in the Italian and Flemish schools, and these performances have been highly and deservedly valued as well by the amateur as by the artist. In the meantime, the estimation in which they are and have been held by collectors and others has given rise to much fraud and some prejudice. One case related by Charles van Mander is amusing. Goltzius, after his return from Italy, where he had studied the different manners or tastes in engraving, undertook six prints. The designs were his own, but he engraved them in the tastes of six different masters, to try if he could deceive the virtuosi, and what is surprising, he engraved the plates in a very short time. He showed them to a few persons only, being determined to have some diversion. For this purpose he fixed on the "Circumcision," which he had engraved after the manner of Albert Dürer. He took a red iron and burnt that part where the name was, and took care it should be smoked, in order to make it appear antique. The print thus disguised passed to Rome, Venice, Amsterdam, &c., where it was received by the connoisseurs and critics with vast rapture, and purchased at a most exorbitant price, the purchasers esteeming themselves lucky in getting such a print into their possession of Albert Dürer's, hitherto unknown. And what was not a little flattering to Goltzius was to hear himself esteemed above himself; for when anyone asked if Goltzius was not the engraver, the connoisseurs made answer that Goltzius was not equal to anything like this work, it being one of the finest prints they had seen of Albert Dürer's. "Some of the critics added that Albert Dürer had engraven a plate which he ordered to be kept a hundred years after his death, and if his works were then in repute that an impression should be thrown off, and not otherwise, and this they affirmed to be the very print. But after many extravagant conceits and encomiums the print appeared fresh and entire, with the name and portrait of

the engraver. The gentlemen connoisseurs were astonished and confounded; some of them even flew into a passion and conceived a pique against Goltzius for pretending thus to impose on them." Van Mander was not sufficiently aware of the nature of prejudice if he imagined it was to be removed even by facts thus adduced. Similar instances of the same kind have taken place since that time and will continue to be repeated again and again, but prejudice still remains.

Mediæval Fortifications.

In the Middle Ages fortifications were made by great baskets filled with earth and stones, paling, hurdles, dead bodies of animals, wine-casks filled with stones as substitutes for paling, ditches and paling, plain boards only, double ditches, bastilles, *i.e.* fabrics of 10 feet thick with towers, furnished with provisions, arms, engines, &c., and made of wood upon sea to act as floating batteries; earthen bastions, blockhouses, sometimes built in such situations that none could enter harbours to reinforce or revictual them. To protect gates from being forced, faggots, beams and casks filled with earth and stones were used to close the entrance, and palisades and a vast quantity of thorns and brambles were put in the front of walls to prevent the men-at-arms passing through. Froissart describes redoubts made of wood, very strong and well built, capable of holding about 1,000 men. Of fortifications of the fourteenth century we have a fine specimen in the outworks of Caerphilly. They are of great extent, and consist on the north-west side of the old moat of a pentagon entrenchment of earth, with circular bastions at the angles; and further north-west, and only divided by another moat, is a large triangular field moated round with a circular moat at each corner. The works that lie to the north-east have a moat of a modern fashion before them. The gate on this side seems more recent, and does not run parallel with the inner gate and eastern drawbridge. The castle was besieged in 1326. These works were then probably raised. Evrard of Bois le Duc, who served under Henry IV. of France, is the first person known to have published a system of fortification.

Piranesi.

Remarkable for his rare ability as an engraver, to which he is principally entitled for his eminence in the history of the arts, Piranesi was as singular in his mode of execution as for the originality and boldness of his designs. He is said to have generally drawn his design upon the plate itself, without any or the slightest preparation, completing it for the most part upon the spot and performing the whole of the operation by the agency of the aquafortis alone, with but very immaterial assistance from the engraver's tool. Though not repeated by the son, tradition reports, with every appearance of probability, that it was a favourite plan with him, having previously selected the particular object of study so as to have his mind well imbued with the minutiae of the buildings, to complete his designs of the vast architectural piles at the period of the full moon, and effect those bold and masterly productions which have so deservedly obtained the decided admiration of the world of taste. This story might appear to owe its origin to the strong chiaroscuro of his designs, but it appears certain that he often used to shut himself up at such periods from his family and friends, and it would be difficult to account for the peculiar effect of many of his works without adopting such a supposition. He worked with such amazing rapidity as well as truth and thorough knowledge of the subject, and such consummate mastery of the principles of the art he professed, that the number of his productions and the magnitude of his plates almost seem to exceed belief. In the course of about forty years, the period of his professional life, he published nearly two thousand plates, each of inimitable excellence, in number and magnitude superior to what has been left us by any other artist.

The Bowley District Council recently submitted a scheme for the erection of libraries, together with plans of the three sites, to Mr. Carnegie. A reply has been received to the effect that he preferred to have three new buildings erected rather than complicate the matter by exchanging buildings, as proposed, at Blackheath. He further stated that when he received plans for the buildings, which should be wholly devoted to the public service of libraries, and he was able to approve them, arrangements would be made for payments on buildings as the work progressed.

The Public and Architecture.

SIR,—I have returned from my mountain trip rather tired from my walking exertions, and have only to-day read in *The Architect* (July 27) the complaints of my colleagues as to the little interest taken by the public in their art. They suggest all kinds of devices to force the public to take pleasure in the things they provide. This seems to me very silly, and reminds me of the old saying, "One man can take a horse to the fountain, but ten men cannot make him drink if he be not thirsty."

Thanks to railways, telegraphs, telephones and the innumerable material advantages science has obtained for us, the present generation is entirely wrapped up in scientific pursuits and does not care a straw for art of any kind. Science means the dry investigation of facts. In this investigation imagination is considered as a perfidious enemy to be driven away at any cost. The object of art is the excitement of our imaginative powers. It is, therefore, the very reverse of the aspirations of our age. Nevertheless arts are patronised. If we look into this phenomenon rather closely, we will find that what is patronised is not the artistic spirit, but the technical, scientific or sportive elements contained in the productions of several arts. Judging by the concerts I have heard I should say that what is now solely admired by amateurs is the capacity of overcoming material difficulties of playing the piano, for instance, with the pace of a motor car at a hundred miles an hour. In architecture the public is principally concerned with the cost of production. The merit of a building lies in its being the exponent of the length of the purse of the owner. To many it may be interesting from the engineering point of view.

If, as I believe, architecture as an art is the art of producing frames which by exciting the imagination give an ideal value to what they contain; if a palace raises in the estimation of men a simple individual to a kind of supernatural man called a king; if the temples on the Acropolis of Athens helped the good people of the place to feel they had living gods protecting their city, then the scientific spirit of our age will see in architecture an arch-fiend whose province it is to deceive the human mind.

This theory fits in with some historical facts. The religious Reformation of the sixteenth century was caused in great part by the scientific spirit of investigation being applied to religion. Hence the destruction of a great number of magnificent works of architecture. The Reformers had the intuition that the splendour of the Roman Catholic cathedrals was their greatest enemy; and they saw this rightly, for we see in our own days the influence of the stones of the cathedrals left standing bring back many Englishmen to the appreciation of the old faith.

In conclusion, let us remember the common aphorism "every dog has his day." When everything that science can give us will have been plentifully provided; when people will not only talk, but see one another across the earth; when they will be whisked across the Atlantic in a second and ride in the air like meteors, there will come a time when mankind will feel that all this does not fill the soul, that something is still wanting for happiness, and then the mind of man will turn again to poetry, to religion and to architecture which helps to foster both. Let architects in the meanwhile wait patiently and try to put a little poetry in their work, whether it be appreciated or not.

Having no more any reason for earning money, I have abandoned the practice of architecture and taken to sculpture. I do not think that the practice of architecture is less pleasant than the art of the sculptor, but architecture involves the practitioner in commercial transactions which are not always pleasant, and offer sometimes danger to one's purse. The sculptor's art, when limited to modelling in clay, is purely personal, needs no paid assistants, involves the practitioner in moderate expenses and offers no risks. That is why it is eminently an avocation for a retired architect. The sculptor's art is akin to the architect's. The produce is in both arts a material object, not a picture, which is only an appearance. In both arts the object produced has to be considered from every point of view. Lastly, sculpture and architecture often run into one another, as when some small monument is designed. Thus, an architect who adopts sculpture finds

much that he has learnt in his first calling will prove most useful in his last avocation, and I may recommend sculpture as a most pleasant occupation to those of my colleagues who retire from active practice.—Yours truly,

LAWRENCE HARVEY.

Geneva: September 21, 1906.

GENERAL.

His Majesty, through his equerry, in reply to a letter addressed to him by Mr. Learmont Drysdale, who arranged a concert in St. Andrew's Hall, Glasgow, for Thursday, in aid of the scheme for the preservation of the Auld Brig of Ayr, has written to say that he is interested in national or historical landmarks, and is always glad to hear of any steps taken for their preservation.

The Late Earl of Leven and Melville has bequeathed 4,000*l.* for the restoration of a chapel in Holyrood Abbey on condition that the plans of Mr. Thomas Ross are carried out under his direction.

Mr. Atkinson, the architect who has charge of Ely Cathedral, is engaged in conducting a search for the shrine of St. Etheldreda, which was concealed from the agents of Henry VIII.

A Committee has been formed in Brussels for the purpose of making arrangements for the erection of a memorial to the late Alfred Stevens, the painter, in that city.

M. Gondonnier, who obtained the first prize in the competition for the Palace of Peace, to be founded by Mr. Carnegie, has been informed that he is to be entrusted with the carrying out of his plan, subject to some slight modifications of detail on the score of economy.

Mr. Charles Long, of the firm of Messrs. Wylson & Long, died on the 13th inst. at his residence near Walmer. The firm designed several well-known theatres and music-halls in London and the provinces.

Mr. Edward Elvine Scrivener, of Newcastle-under-Lyme, a member of the firm of Messrs. R. Scrivener & Sons, architects, Shelton, who died in May last, left estate valued at 15,238*l.*

The Stirling Fine Art Association will organise an exhibition next year which will be opened on February 2. The last exhibition took place three years ago, and was a financial success.

Sir W. B. Richmond, R.A., has been awarded the first gold medal of the Institute of British Decorators in consideration in particular of his decorative work at St. Paul's Cathedral. The presentation will be made at Painters' Hall in November.

A Memorial Exhibition of the works of the late Mr. Gilbert Foster will be opened early in October in the Leeds Art Gallery, with the consent and sympathy of the chairman and committee of that Institution. A large and representative collection of the life work of this much-regretted painter is being gathered together from private collections and other sources, including the pictures and sketches left behind at his death.

The Local Government Board have intimated to the Bournemouth Town Council that they cannot accede to the application for permission to raise a loan to secure certain land in the borough reserved as an open space, on which it is proposed to erect municipal buildings.

The Institut de France has sent as delegates to celebrations at Aberdeen the following representatives of the different sections:—MM. Jules Claretie, of the Académie Française; Salomon Reinach, of the Académie des Inscriptions; Becquerel, of the Académie des Sciences; Bernier, of the Académie des Beaux-Arts; Boutroux and d'Eichthal, of the Académie des Sciences Morales et Politiques.

Mr. Pittendrigh Macgillivray, R.S.A., and Mr. Morham, architect to the city of Edinburgh, have submitted a plan to the sub-committee of the provisional committee which has under consideration the proposed new art school for Edinburgh. A further meeting of the municipal art school committee was held on Saturday, when Mr. Morham, the city architect, reported that the number of students set down as likely to take advantage of the school was between one and two thousand. The teaching will be of a very complete character, embracing art as applied to many industries, and it is expected, once it is set going, the number of students will be greatly increased. Before deciding on plans for the building the committee decided to obtain information from various quarters.

The Architect.

THE WEEK.

It does not augur well for the French that of late years they are losing that respect for old works which led to the establishment of the Department of Ancient Monuments. From recent acts it might be supposed that the Department was no longer recognised by the Government. One instance is now causing indignation among French archaeologists. Cahors is one of the most remarkable provincial cities, for its steep and narrow streets, with the curious buildings lining them, bring us back at a glance to Mediæval times. But Cahors is very much older, for it was a Roman settlement. It also possesses three ancient bridges over the river. The Municipal Council recently proposed to reconstruct one of them which dates from the thirteenth century. Protests were instantly raised, and a memorial was addressed to M. CLEMENCEAU, the Minister. He ordered that a despatch be sent to Cahors to suspend operations. But the engineer in charge of the work refused to obey it on the grounds that he only recognised the local maire. Now the Municipal Council, having entered into a contract which was approved in the usual way, have declared that the suspension of the works will involve them in heavy pecuniary responsibilities. They have accordingly protested against the action of the Minister of the Interior as being contrary to the usual rules and regulations. Meanwhile the demolition continues, and there is now a struggle between Paris and Cahors concerning the ancient Pont Neuf.

WHILE the British Government is labouring to make provision for the material and social needs of modern Egyptians, a great many people are found ready to aid in researches which will afford evidence of the ancient history of the country. On Monday last the Manchester Egyptian Association was formally constituted. Already, it appears, there is a class in the Manchester University for the study of hieroglyphics. The members of the new Association will co-operate with the Egyptian Students' Research Association, having headquarters in London, and which has about 200 members. Meetings will be held, at which the latest results of explorations in Egypt will be explained. The Manchester Museum already possesses an excellent collection of antique objects found in Egypt, and they will be utilised as aids to the studies of the members. Liverpool has for some time been an active worker in the field, and it was scarcely to be expected that Manchester would fail to compete with its rival city.

THE Carnegie Dunfermline Trustees have been departing from the usual course by appointing a sculptor as superintendent of art in that ancient city. Mr. REGINALD GOULDEN will act as supervisor of the teaching of drawing in the schools, and he will also organise evening classes where it is hoped that a higher taste for art in connection with local handicrafts will be developed. Artists who work in wood, iron, plaster and stone are expected to benefit in a special way by the new arrangement. Mr. GOULDEN will also have his own studio in which he can carry out any commissions he may receive. It is, however, announced that all interested in the project will be welcome in the studio, and by that means an improved taste will be fostered in the community. The appointment realises some official recommendations. Mr. PITTENDRIGH MACGILLIVRAY in his special report on Scottish schools of art came to the conclusion that there was not enough of the workshop about them, and that there was little use in a system which would only produce amateurs and superfluous artists. What was wanted was the attainment of the craftsman's power in using material and applying it to practical ends. The

new experiment is not the first made by the Trust, and the results will be watched with interest. In the industrial war which is now being waged painters of pretty pictures which cannot find a place even in second-class exhibitions are of no use as combatants. Yet vast sums of money have been spent by the country during the past half-century on their production. It is time there was a change.

THE Liverpool Town Council having declined to accept the proposals of their own water committee, that Birkenhead should have a share in the Vyrnwy supply by paying liberally for the privilege, the Birkenhead Town Council will now have to undertake the gravitation scheme which was adopted in May last. If carried out in its entirety it is estimated to cost 1,740,000/. But it is only proposed at first to proceed with as much of the scheme as would supply seven million gallons of water daily, with a reserve of a million gallons, for an outlay of 740,000/. It would mean an increase in the charges for water used for domestic purposes from 10½d. in the £ to 1s. 4½d. But whatever the expenditure a new water supply must be secured. Mr. DEACON is to be appointed engineer-in-chief, and it has been arranged that the Corporation are to pay him for commission, fees, and in full discharge of all claims for his services, 20,000/., in certain proportions, the first proportion of which, 8,000/., would become payable after the working plans and drawings had been prepared. If the outlay on works should exceed the estimated sum no additional commission is to be paid. It was also agreed that upon the deposit of Parliamentary plans in November the Corporation would pay to Mr. DEACON 630/., and upon the royal assent being given to the Bill 420/. in full discharge; but if the Bill was rejected, withdrawn, or prevented going on, the Corporation will pay to him 735/. instead of 420/. in full discharge. If the passage of the Bill should be stopped before its first reading Mr. DEACON would only be entitled to a portion of the 1,365/.

VERCINGETORIX may be said to have attained an official position in French art, for whenever a young sculptor wishes to show what he can do in the production of a draped figure on a colossal scale the brave representative of the Averni inevitably rises before his mind. CÆSAR in that way has helped to immortalise himself, for without his Seventh Book VERCINGETORIX would probably remain unknown. The fate of the majority of the statues can be imagined. But a few years ago one of the biggest was completed and set up at Alise. At the time we described the transport of the figure through Paris, where it caused amazement from its dimensions. CÆSAR says the Gauls were collected in the town of Alesia, which was in the territory of the people described as Lingones, after being defeated on the battlefield. They were besieged. VERCINGETORIX, who was in command, first drove out of the town the aged men and women and children to implore CÆSAR's pity and to receive them into his camp. But he declined. A large army of Gauls came up to rescue their friends, but they were either slain or driven away. Whereupon VERCINGETORIX surrendered. He was taken to Rome, and after six years' confinement was put to death. According to the Roman general, Alesia was built on the east side of a high mountain, at the foot of which were two rivers and a plain having a length of three-quarters of a league. The description applies to more than one place in the district, and there is much difficulty in identifying the position. M. BÉRARD has come to the conclusion that the site of the conflict was not Alise but Izenore, which is thirty-five miles distant. The French Institut still maintain it was at Alise. If M. BÉRARD's researches should be confirmed the enormous statue will have to make another journey, and it seems destined, like the hero it represents, to serve as a trophy in somebody's triumph.

THE CITY GUILDS INSTITUTE.

IT is evident from the latest report of the Council of the City and Guilds of London Institute that the executive committee must have had recently a period of unusual anxiety, and they cannot be sure that it is at an end. The centralising spirit which has so long ruled at South Kensington has lately become more ambitious than ever. The action of the departmental committee which recently inquired into the provision for technical education did not augur well for the Institute. Government officials, including professors of science, are not favourably disposed towards institutions which represent voluntary efforts. The fact that since the foundation of the City and Guilds of London Institute the large sum of 733,802*l.* 19*s.* 6*d.* has been obtained through donations and subscriptions is evidence that the system represented by the Institute has found favour in London at least. The success of the technological examinations throughout the country as well as in the colonies is further proof of its power.

The Institute has shown that it was not inspired by narrow motives. In 1903 a special course of instruction in electrical engineering was arranged for students of the Royal College of Science and School of Mines. The desire was expressed at the same time that when the new chemical and physical laboratories at the College of Science were completed the students of the Institute might have the use of them. By that arrangement the Central Technical College would be able to confine its courses more strictly to civil, mechanical and electrical engineering.

Another circumstance which could not be overlooked was that the students of the Institute were in demand by manufacturers, corporations, &c. It still continues. In the report a list is given of the forty-eight students by whom the diploma of Associate was earned last year. Some of them were able to continue their studies at the Central Technical College, but, with the exception of three, all have received appointments. Success of another kind was obtained in art. The South London Technical Art School has produced several Academicians and Associates, and apparently clever students continue to be attracted. The report states that for the sixth time the gold medal and travelling studentship of 200*l.* was carried off by one of the students. According to a late report of Mr. SPARKES one-fifth of the whole number of works in the Sculpture Hall of the Royal Academy came from students. He is justified in saying that in sculpture alone is there a sign of breaking new ground.

"The work on our public buildings," continues Mr. SPARKES, "is no longer of the conventional type to which we had grown accustomed through many dull years. The old idea that sculpture consisted in a statue in marble or bronze or a bust is departed; the sculptor now takes for his field every section of decorative plastic work, and whatever is undertaken is invested with a new spirit of intelligence, ingenuity and originality. If we contrast the position of sculpture to-day with that which it occupied twenty years ago, we shall find not merely advance, but a new art. And whereas twenty years ago the French sculptors were leading in Europe, I think we may now without any affectation say that the lead has passed to this country. I am afraid it is but repeating a well-worn observation, that the majority of the men who have carried sculpture to its present pitch have been reared in our school. It is certainly gratifying to remark that the position at which we arrived so brilliantly ten years ago has been left far behind by the productions of our students in the past two or three."

In painted decoration also the technical art school has prepared men for business. Another innovation which has been attended by success is the instruction in enamelling in the Finsbury College. When the classes were established the art did not exist in England, and enamelled watches had to be sent abroad for repairs. Only a rough imitation was attempted for cheap

jewellery. Mr. FISHER, who has studied in Paris, was appointed as teacher, and so many students took up the art there are classes for it in many parts of the country. There has been so much progress that specimens are to be seen at every exhibition of the Royal Academy.

The recommendations of the departmental committee would group all the teaching institutions at South Kensington around the University of London. That of course means a revolution, and as yet no definite explanation has been given about how it will be carried into effect. How far the City and Guilds of London Institute will be affected has not been divulged. Sir JOHN WOLFE BARRY, who is chairman of the executive committee, said there is a desire that the Institute's college should be distinctly associated with the new movement. But he adds:—"Sir FRANCIS MOWATT and Mr. HALDANE only so far wished to broach the matter to me as to ask whether I thought an idea of this sort would be acceptable to the supporters of the City and Guilds Institute, stating that I need not go any further than give my private ideas on the subject." Here we have an instance of diplomatic manœuvring. And Sir JOHN WOLFE BARRY was acting wisely in his reply. He tells us:—"I said very strongly that I thought the Council of the City and Guilds Institute would not like to lose their autonomy in the matter, that it should not be an absorption but a co-ordination, and I was assured by both gentlemen that that was distinctly the view of all those who had the matter in hand—that there was no idea at all of doing anything more than asking us to fall in with a general scheme for improved educational courses at South Kensington, in which the City and Guilds Institute would take a very leading part in the future as it has in the past." In the final report of the departmental committee one of the recommendations is that five representatives of the Council of the Institute should be among the forty members who will constitute the governing body.

Meanwhile the Council of the Institute continue to act on their own principles, which have been found so beneficial in working. The number of students is increasing and the standard of examinations has been raised. The fees have also been increased from 30*l.* to 36*l.* a session. University students find it an advantage to attend the college, and there were over 140 in the last session. About 14,456*l.* has been expended on a new wing at the Finsbury Technical College. It is stated that in the course of building tanks and channels were inserted, which, with the addition of necessary machinery, will form a piece of hydraulic apparatus suitable for the study of many engineering problems.

The technological examinations likewise exhibit signs of vigorous growth. Last year examinations were held in sixty-nine subjects and nearly 20,000 students entered themselves. The number of examinees in carpentry rose from 1,952 to 2,189, brickwork from 755 to 834, and masonry from 515 to 622. The examination in builders' quantities, which was held for the first time in 1900, appears to have met a distinct need; the number of students in attendance at registered classes last session was 1,396, of whom 799 presented themselves for examination, as compared with 1,264 students and 683 examinees in 1904. One interesting feature of the examinations is that several trade societies aid them by advice and encouragement to students.

It is hardly necessary to state that the Institute is not yet self-supporting, and probably will never attain that state. The income for 1905 amounted to 56,443*l.* including a gift of 10,000*l.* towards the cost of the extension of the Finsbury College. The total expenditure reached 54,674*l.* The fees at the Central Technical College amounted to 11,874*l.*, while the net expenditure was 17,495*l.* In the Finsbury College the fees were 3,557*l.*, and the expenditure, exclusive of building, 10,582*l.* In other words, Finsbury has cost the Council about 1,600*l.* more than the Central College.

PAUSANIAS IN ATHENS.

IN one of Cardinal NEWMAN'S essays he gives an imaginary report by the agent of a London company who was sent to Attica to consider its resources. It had to be entirely a matter-of-fact composition, and would exclude a great many of the characteristics which at one time made the land dear to pilgrim students from various parts of Europe. We cannot suppose that any true representative of Oxford would be irreverent towards an ancient Greek book. But the idea of a business man describing Attica or any other part of Greece might have been suggested to the Cardinal by a glance at what is known as the "Itinerary" of PAUSANIAS. As long as Greece exercises sway over the human intellect that book must be respected, and yet it is impossible to avoid feeling that its composition was inspired by purposes which differed from those of such a traveller as STRABO or the Englishmen of a later age.

PAUSANIAS says very little about the soil of Greece or its physical aspects. He was no landscape-painter. He is also silent concerning the inhabitants of the towns he visited. It might even be imagined from his pages that Athens and many memorable places were mere cities of tombs or other relics of antiquity, just as Pompeii is to-day. We learn no doubt a great deal about the people of a past age, for there is probably no book of the same size in existence which contains so many proper names. They are, however, so remote and ghost-like that an ordinary reader must welcome the passage in which PAUSANIAS speaks of his interpreter. He at least was a living man.

As he does not suggest that the Greek cities were inhabited by men and women, he avoids giving any description of residences. We may go through the ten books relating to the different districts he visited without being any wiser at the end concerning the subject of human habitations. We know that in Athens men who gained renown were afraid to possess anything that could be called a palace. But it is difficult to believe that sort of policy prevailed all over the country. Human nature is stronger than expediency and it is in favour of luxurious dwellings. A man like SOCRATES might live in a small house in a back lane, and might use the front room of the ground floor as a workshop and for displaying the draped Graces and other wooden figures he carved. But we cannot suppose that ALCIBIADES and PLATO, although they admired him as a mentor, would put up with similar discomforts, or that the philosophy of the wealthy sophists recognised similar self-denial. The Greek temples had a use which is unknown in modern Europe, for good people are not satisfied now with gazing on the outside of a church, and some other kinds of buildings were adapted only to the peculiar conditions of Greek life. But the house can never be superseded, and men must always be eager to know whether the Greeks, who in so many ways were superior to those who followed them, had exercised their good sense, their love of proportion and their admiration for beauty in their own rooms as well as in the public places. On that subject, as we have said, PAUSANIAS is no guide.

It is, therefore, always amusing to anyone who has made a study of PAUSANIAS when he finds it occasionally stated that the traveller described everything that was to be found in a Greek city. By some extraordinary delusion able and honest men are to be met with who seem to think that they can be more familiar with the ancient Greeks than with their own contemporaries. The late Sir DIGBY WYATT was a scholar, and when he was SLADE professor and lecturing in Cambridge he was addressing scholars. Yet he did not hesitate to say that we can trace the progress of Greek sculpture almost year by year. The least attention to the subject of the chronology of art or of biography would have prevented the utterance of so exaggerated a statement. So it is with regard to PAUSANIAS. It is imagined that he does justice to Greek buildings of all

kinds, when the fact is there is not a single adequate description of a temple in his ten books. We do not wish to imitate other critics and to pose as having a special knowledge of the traveller. We judge of him solely by his pages. But with them as evidence we have no hesitation in saying he was incompetent to describe a great building. We may suppose, for instance, that, like the cheap excursionists of to-day, he was limited as to time, and that every Greek city offered so many objects for admiration it was difficult to fix the attention on a single one of them through becoming distracted by the others. It happened with PAUSANIAS, and it is a misfortune for us, that he was certain to become most distracted when his attention should have been most concentrated. One example will suffice.

Before he entered Athens he could not help being reminded, if he did not know already, that he was coming under the influence of MINERVA or ATHENÉ. She appeared, as it were, in several characters. In one place a statue of the goddess was set up as if in rivalry against one of the daughters of ÆSCULAPIUS. There ATHENÉ was called HYGEIA, or the health-giver. Another statue showed her chastising MARSYAS for daring to play on a flute which the goddess had cast aside. Elsewhere she was seen rising from the head of ZEUS, and in another place appeared as the patroness and protectress of craftsmen. PAUSANIAS seems to have excused himself for his delay, amidst so many memorials, in describing the Parthenon, the great temple of the goddess. On one pediment, he says, was sculptured the birth of the goddess, and on the other the contest with NEPTUNE. It will seem incredible to those who have not read the description that nothing more was said concerning the temple itself. The mention of the goddess compels him to turn away to note the statue of gold and ivory, which he describes at length. He was always glad to introduce something in praise of HADRIAN, and he records that the only statue of a man to be seen within the temple was one of that emperor. Even APOLLO was kept outside. A scholar of our time would find that the Parthenon, although in ruins, could provide materials for a volume. And yet with all his supposed admiration of architecture the whole of what PAUSANIAS says about it and its treasures could be printed on a small page.

It may be said in explanation of the brevity in which architecture was treated by him that the temples were countless, and PAUSANIAS could have said in the Johnsonian manner, "When you have seen one Greek temple you have seen all." It was likely to have been a relief to him to mention one built of copper at Delphi, and one of wax which the bees erected with their wings at Tempe. But it might be supposed that when there was any deviation from the familiar Doric form PAUSANIAS would be careful to point it out. One extraordinary instance is deserving of remark. As we have stated, he was always disposed to express praise of HADRIAN, who undoubtedly proved himself to be more an Athenian than the Athenians themselves by his desire to elevate Athens. He expended vast sums on statues and buildings. He erected one temple to JUNO, another to ZEUS as protector of all the Greeks, and a third to all the gods, or an Athenian Pantheon. The last was long supposed to have been a palace. Other investigators considered the remains to have belonged to a temple. WILKINS, who designed our National Gallery, and in consequence lost the reputation he merited as a student of Greek architecture, was the first to suggest that the ruins formed part of HADRIAN'S Pantheon. PAUSANIAS says there were 120 columns of Phrygian marble in or outside the temple, that the porticoes and walls were of the same material, that the niches were ornamented with paintings and statues, and that the ceilings were brilliant in gold and alabaster. Near the temple was a library and a gymnasium, or place of exercise, which was named after HADRIAN, and where the visitor could see 100 columns of beautiful marble derived from Libyan quarries. As

our readers are aware, the Athenian Pantheon is remarkable from being a specimen of Roman Corinthian, and must in the second century have appeared as a conspicuous contrast to the other temples of Athens. But PAUSANIAS is silent about the style of the building. We do not suppose that he was not aware of the difference. When describing the temple at Tegea he points out that its principal beauty consists in the use of the three orders; the Doric and Corinthian being found inside and the Ionic order on the exterior. The architect was, he believed, SCOPAS the sculptor. This instance by itself is enough to show that all columns were not alike in his eyes, although he might neglect to discriminate between them. In several places he mentions the three orders.

A more noteworthy instance is afforded by his account of the compound and unique temple called the Erechtheum. It is a very valuable example of the Ionic order and the porch is especially remarkable for its caryatides. It is surprising that the figures of the women did not engage the attention of a man who appeared to be more a lover of sculpture than of architecture or painting. Nor does he mention the style of the columns. We hear about the three altars, about the well of salt water which did not appear to PAUSANIAS to be miraculous, about the stone covering the well which NEPTUNE marked with his trident, and other marvels. But much controversy would have been spared if he had been more definite in describing the different parts of this puzzling temple. It is taken for granted that the golden lamp always kept lighted before the statue of ATHENÉ, which had fallen from heaven, was in the Erechtheum. But the words of PAUSANIAS do not support that theory, although he does not say precisely where it was to be seen, nor does he indicate the position in which the neighbouring Temple of Athené Polias was found.

It is a peculiarity of PAUSANIAS that he appears to promise much to the superficial reader. But when any of the statements are analysed, they are found to be remarkable for their vagueness. We have just referred to the lamp, which, on account of the nature of the wick, required to be filled with oil only once a year. CALLIMACHUS, the sculptor, according to PAUSANIAS, made a great bronze palm, which was as high as the roof, and which was placed over the lamp in order to diffuse the smoke. That appears to be a very definite statement. The only plan, however, which the late Dr. MURRAY could imagine for such an appliance was "that the palm tree was inverted so that its spreading leaves would form a reflector, while the hollow stem would conduct away the fumes." People who are acquainted with modern gas "sunlights" might approve of such an arrangement, but it is doubtful whether Greek logic would approve of such an inversion of a natural form.

The most important instance of PAUSANIAS's failure to describe a work of art arose out of POLYGNOTUS's painting in the Lesche of Delphi. No other work was made the subject of so much detail by the traveller. Yet when theorists attempt to arrange the figures they find themselves incompetent to produce a satisfactory result. GOETHE was so fascinated by the problem, he investigated it with his usual thoroughness and made, as he thought, type diagrams of the two series. BÖTTIGER a few years afterwards, in his work on the "Archæology of Painting," went still further in the attempt to group the figures. FUSELI in one of his lectures said that the accounts of the pictures are mines of information, an inestimable legacy to the arts. Yet on further consideration FUSELI came to the conclusion that the paintings must have been totally wanting in what is now called composition, that there was no perspective, that many of the figures had to be designated by letters, although he says we should be cautious to impute to ignorance or imbecility peculiarities which may have been based on principle.

With all its shortcomings, the description of PAUSANIAS is impressive, and it may help us to under-

stand the true character of his book. About the writer himself hardly any information is forthcoming. He might be considered as a Romanised Lydian. It is believed that he visited Greece in the time of ANTONINUS PIUS. From the eulogies he bestows on HADRIAN and the reigning emperor we might infer that he was an official. The two rulers endeavoured as philosophers to atone for many acts which were allowed to be perpetrated during preceding reigns. Greece was repeatedly pillaged, and works of art were carried away to adorn the houses and gardens of Roman officers or to be sold as spoil. It would not be unreasonable to suppose that under HADRIAN or ANTONINUS PIUS an effort should be made to put an end to a traffic which was without any advantage to Rome as a State, but which embittered the Greeks and prevented them from becoming loyal subjects. If we can imagine a Government department proposed for the preservation of works of ancient art in Greece, then such a compilation as that bearing the name of PAUSANIAS became a necessity. An official inspector would bestow as little attention as PAUSANIAS on the temples, knowing that the smallest of shrines could not be easily transported. He would be careful, on the contrary, to catalogue every painting, statue or work of art, like the palm tree which conveyed the smoke of the lamp, in order that measures should be taken for their preservation. The inspector could not imagine that a soldier would have the enterprise of Lord ELGIN, and therefore no regard was given to the Pan-Athenaic frieze and the metopes which have found a home in Bloomsbury. It may seem extraordinary that any intelligent observer should pass over such noble works. But while they formed parts of the temple they could not be carried off by stealth or without the knowledge of the Roman representative. The works of art within the temple, such as the statue of gold and ivory, were more exposed to danger. To Roman connoisseurs the painting by POLYGNOTUS at Delphi was likely to appear the most valuable work remaining in Greece, and therefore PAUSANIAS mentioned every one of the figures represented. Some may say that the intention of PAUSANIAS was to provide a guide for those who wished to take measures for the removal of paintings, statues and other works. That belief would be an offence against the memory of a man who, by revealing the wealth of Greece in works of art, has afforded delight for nearly four centuries. *i.e.* since 1516, when an edition of the "Itinerary" was printed by ALDUS in Venice.

DURHAM AND NORTHUMBERLAND ARCHÆOLOGICAL SOCIETY.

AT the last meeting of the above Society for the year 1906 a large number of members and friends assembled at Bishop Auckland station, and took carriages to Escomb old church. After a survey of the exterior of the building the president (Rev. Canon Greenwell), who was, says the *Durham Advertiser*, heartily received by the members after an absence of nearly two years, addressed the gathering. He said that the ancient name of the place was Ediscum, and it belonged to the church at Durham. Bishop Aldhun transferred it to the three earls, and Northman retransferred it to St. Cuthbert. Escomb was one of the six prebendal stalls at St. Andrew's, Auckland. It is one of the very few pre-Conquest churches complete from one end to the other, and all of one building. It consists of merely a nave and chancel without aisles or transepts, and the nave is 45 feet long by 14 feet wide inside, the chancel measuring 10 feet square. The date is difficult to fix, but it is probably about the eighth century, and the sepulchral memorial crosses, with work on them, are of undoubtedly the eighth century. The church is narrow and lofty, and possesses many original doors and windows. The chancel arch is original and built of stones brought from the neighbouring Roman camp of Binchester; in fact, it appears to be a Roman arch removed. Although the upper courses of the walls are of smaller stones, there is no reason to doubt that all was built at the same time. Canon Greenwell suggested that these were from the centre

of the walls of the camp after all the available facing stones there had been exhausted. The latest additions to the church are beautiful lancet windows and a chancel window replaced early in the eighteenth century. The porch and bell-gable and west window, and a large window in the south wall, are also later, and with these exceptions the whole building is of the eighth century. It had been proposed in Bishop Baring's time to add to the church, and make the old church a chancel of the extended building, but Bishop Baring caused an entirely new church to be built on a different and more central site, and thus the old church was preserved intact. Some years ago a member of this Society told Canon Greenwell at a meeting of the Society at Binchester that there was a very old church at Escomb, and accordingly about a dozen of the members at once walked across. As soon as he saw it he knew that it was a Saxon church. The vicar (Rev. T. Lord) took the matter up, and had it repaired and the roof restored, &c. That was how it was discovered. On the exterior of the church was found the letters L E G V I in Roman broaching, and on the south wall is a sundial of the date of the church. Remains were found at the west end of an addition, no doubt the residence of the priest. He recommended that excavations should be made to discover its area. There is a piscina in the south wall of the chancel of very simple character, and may be of the original church. There are also memorial crosses of the characteristic work of the eighth century, and a few Mediaeval grave covers of the thirteenth century.

The party then drove on to Witton Castle, where they were met by the present occupier, Mr. W. F. Pease, and by Rev. J. F. Hodgson, of Witton-le-Wear, who took them round and described the building. It is situated in a beautiful and commanding position overlooking the valley of the Wear and surrounded by very extensive gardens and plantations. Mr. Hodgson stated that in the time of Henry II. Witton was royal property, and was bought by Bishop Pudsey from the king for 2,000 marks for his son Henry Pudsey. The castle was built by Ralph de Eure, to whom a license was granted to build by Bishop Langley, and at the same time he was fined for building without permission. No vestige of any earlier building remains, but the present keep tower, with its barrel-vaulted basement, and the walls surrounding the courtyard, are remains of his castle. After the Eures it was owned by the Darcys, who also did much building, and the late owner, Sir W. Chaytor, also executed more work. Across the courtyard is a large detached tower, probably built early in the sixteenth century. After a walk through the beautifully-kept and spacious gardens, and on the top of the courtyard walls, from which a fine view was obtained, the party proceeded to Witton-le-Wear. The church here was described by the vicar. It has been recently almost entirely rebuilt, as it was in a dilapidated and ruinous condition and contained few features of antiquarian interest. These, however, have been retained in the present edifice, including much of the nave arcade, the south doorway and porch.

From Witton the members drove to Hamsterley, where the church stands high on a hill overlooking the valleys of Wear, Bedburn and Linburn. It is about a mile from the village, and consists of nave, chancel, north and south transepts, the nave and chancel dating from 1190, the south transept 1210 and the north transept from 1280. The transepts were originally built as chantry chapels. There are two stone tombs built partly under the wall of the south transept and projecting about 3 feet beyond the church. One is of a lady, and the other is beautifully carved. They are probably of about the year 1320. The church also contains several fine grave covers built into the walls. The visitors also discovered three or four early grave covers in the churchyard walls, which the vicar promised to have taken out and removed into the church. A vote of 5*l.* was made to the vicar towards the proposed repair of the building. A short walk from the church brought them to the "Common Fields," where Canon Greenwell gave an interesting account of the old manner of cultivation and the relationship between lord and villein in ancient times. These common lands consisted of strips of arable land divided by balks or cams, several of which still exist at Hamsterley. These plots were allotted to the peasantry, each occupier changing his plot every year.

Mr. J. Forsyth, sculptor, has presented to Dudley the original model for the fountain erected in the market-place from his design.

TREASURE TROVE IN SHEFFIELD.

LAST week workmen excavating for the foundations of a house at Pittsmoor came upon a number of ancient Roman silver coins. How many they found is not known. They apparently shovelled a good many into carts that were removing the soil. Numbers were recovered at the brick-works to which some of the soil was carted. Others were disposed of for beer.

When the discovery became known there were two claimants for the coins. The chief constable (Commander Scott) claimed them on behalf of the Crown, Mr. T. Winder for the Duke of Norfolk, on whose land they were found. Each secured a share. Consequently at the Mortuary the Chief Constable, sitting on one side of the table, asked Mr. Winder, sitting on the other, how many he had. Mr. Winder said twenty-one and the Chief Constable fourteen.

For the present, says the *Sheffield Telegraph*, the coins remain with the representatives of the Crown and the Duke. The find will be reported to the Home Office, and the Home Secretary may demand the lot for the British Museum. The Duke of Norfolk, with his usual generosity towards the city, is quite willing that the lion's share, which his representatives have secured, shall be deposited in one of the Sheffield museums. They are such notable evidence of the Roman occupation of Sheffield that their home certainly ought to be here.

The conclusion to be arrived at from what was said at the inquiry is that the coins were buried where they were found something like 1,720 years ago. Through all those seventeen centuries they have been undisturbed within 2 or 3 feet of the surface of the ground. The coins run consecutively as to the date from A.D. 69 to A.D. 180. It is the Coroner's theory that they were buried when the Romans withdrew from England. Presumably they were placed in an earthenware jar, for Mr. Winder found fragments of a pot which might well have held them. Now that the dirt has been cleaned off, the figures and inscriptions on the coins are all astonishingly clear. They never had much of the wear and tear of circulation.

Following is a list of the coins in the hands of the police as prepared by Mr. E. Howarth, curator at the Weston Park Museum. No list of the coins held by Mr. Winder has yet been prepared:—

- 2 coins of the Emperor Domitian, A.D. 69 to 96.
- 3 " " " Trajan, A.D. 98 to 117.
- 3 " " " Hadrian, A.D. 117 to 138.
- 1 coin of Sabina, wife of Hadrian.
- 1 " the Emperor Antoninus Pius, A.D. 138 to 161.
- 1 " his wife Faustina.
- 2 coins of the Emperor Marcus Aurelius, A.D. 161 to 180.
- 1 coin not yet deciphered.

Mr. Kenyon Parker, deputy coroner, who conducted the proceedings, said according to an old Act of Edward I. it was the duty of a coroner to hold an inquest into cases of treasure trove. As far as he could ascertain, the coroner had no discretion in the matter. The only duty of the coroner and his jury was to inquire whether the articles were treasure trove and who were the finders; it was not within their jurisdiction to decide whether the Crown or anyone else was legally entitled to them. Therefore, from a modern practical point of view the inquiry was perhaps not of great importance, although he understood that historically considerable interest attached to it. There were, however, two practical points about the inquiry. First, it formally acquainted the Crown with the circumstances, and, secondly, if the jury found that the coins were treasure trove, it warned any persons who were in possession of any of them that if they detained them they were liable to fine and imprisonment, and might be prosecuted for stealing. No similar inquest had been held in the Sheffield district at least during the time of the present Coroner and his predecessor, although it was stated that in 1860 a vase containing about 100 silver Roman coins was dug up at Wincobank, about a mile from where this was found. According to the English law any silver coins found hidden in the earth or in any other private place, and the owner of which could not be found or was unknown, was treasure trove.

Mr. E. Howarth, curator at the Weston Park Museum, then described the results of his examination of the coins. He roughly estimated the value at from 5*s.* to 7*s.* 6*d.* per coin.

The Chief Constable said he was not very well satisfied with the attitude of Arthur Godson, who found most of the coins, and asked the coroner to press the man, as he had not given them the slightest information. Godson was

excavating for the cellars of new houses at Scott Road when the coins were found. Most of the soil, he said, was carted to a brickyard, although some of it on the top was taken to gardens. He said he sold a good many of the coins, but could not remember all of them.

What did you get for those you sold?—A pint of beer, a quart of beer, and sixpence.

How many did you sell?—Half a dozen or a dozen. About ten or twelve altogether. I didn't know the value of them.

You were glad to get a pint of beer for them, I suppose?—Yes.

And you swear you don't know the names of the persons you sold them to?—I can't remember them.

Charles Bates, foreman at Whitaker's brickyard, had had sixteen of the coins. Three he found in a clay pan at the works, and the others he obtained from Mr. Marsh. He was asked to give them up to the police, but declined, as his employer had instructed him to hand them to Mr. Winder.

Mr. Thomas Winder produced a plan showing where the coins were found. He also produced fragments of pottery.

The Chief Constable: We don't claim them.

Mr. Winder: That's a relief.

Replying to the Coroner, Mr. Winder said he had given the Chief Constable an undertaking not to part with any of the coins.

Formal evidence was also given by Detective Yates.

The jury found that the coins were treasure trove.

Mr. Younge (representing the Norfolk Estate Office) claimed all the coins on behalf of the Duke of Norfolk.

The Coroner: I have nothing to do with that.

NORWICH CASTLE MOUND.

AT the meeting last week of the Norfolk and Norwich Naturalists Society, Mr. J. T. Hotblack showed photographs and drawings of the excavations of the Castle Mound, and said:—The history of the Castle Mound at Norwich has for a long time been very much discussed. There has been considerable difference of opinion as to when it was raised. Is it a pre-Roman work, or did the Saxons raise it and place one of the wooden stockades on the top of it? Or is it no older than the Norman Keep which even now crowns it? I do not think that its age has been at all satisfactorily disposed of, and I am very loth to agree with some recent opinions which would make it no older than the Normans. One argument used against the Norman theory has been that it could not have consolidated sufficiently, if they raised it, to carry the weight of their very heavy stone castle. But then the question arises, To what extent is it an artificially raised mound? I think the general opinion has been that it was entirely artificial, and this view seems to be confirmed by the report made as to the sinking of a borehole inside the Keep at the time of its conversion into a Museum Gallery, which was said to have been taken down to the level of the present bottom of the moat, through made soil all the way, undisturbed black alluvial being found, if I remember rightly, at the bottom of all. Now by the ever to be lamented work of the county in preparing for their new monstrosity, we know that, at all events on the side next the Shire Hall, the whole of the mound is not artificial, but that those raising it, whoever they were, took advantage of a natural hill or cliff, which they found ready to their hand, and only added to it to make their mound. I have had photographs taken, and myself have sketched during the progress of the recent cutting away of the hill, and these plainly show that for some feet above the present ground level there is sand and gravel inside which has never been disturbed since it was deposited in some comparatively remote geological period. The height of this undisturbed ground will be seen, by comparing the sketches taken at different times, to rise as the mound is entered, and it may be reasonably expected that further into the mound the natural ground would be found higher still. The builders have not been content with cutting away the face of the mound, but they have gone down some 10 feet deeper than the ground level, and this cutting shows the undisturbed chalk, with many large flints inside in places, but just below the ground level; and, again, I should not be surprised if the undisturbed chalk itself rises higher further into the mound. On the other hand, trial holes sunk only a few feet from the base of the mound show 20 feet of black under soil, and even at 20 feet have not reached the bottom of it. One word more as to the unwisdom of these operations.

Norwich Castle on its prehistoric mound is one of the irreplaceable treasures of county and city alike. The Castle was, I believe, used by the county (as well as by the city) as an heraldic device until recently replaced by the present ridiculous combination which makes up a shield, the meaning of which I have found no one to understand. Nothing should have been done either by cutting away the mound to endanger the buildings on its summit—(there are already ugly cracks in the castellated wall near the present Shire-hall)—or by erecting fresh buildings to either hinder the view of the Castle from below or that of the city and the country round from the top of the mound. I venture to predict that the present county authorities will in the future be as generally condemned for the erection of these buildings as are now their predecessors for the money they worse than threw away on the refacing of the Keep.

PUBLIC MONUMENTS IN EDINBURGH.

THE condition of some of the public monuments in Edinburgh has been attracting the attention of members of the Town Council, and a report on the best method of improving the appearance of the monuments and preserving them from the ravages of the climate has been prepared by Mr. Pittendrigh Macgillivray, R.S.A. The report deals with the Sir Walter Scott and Allan Ramsay monuments as instances of marble and stone erections, and with those to the memory of George IV. and Pitt as samples of the bronze. At a meeting of a sub-committee of the Lord Provost's committee the report was considered. The examination, it seems, has shown that some of the monuments are in an exceedingly bad condition, practically nothing having been done either in the way of restoration, preservation or cleaning. In regard to the Allan Ramsay monument, an attempt had been made, it appears, at some time to clean the marble, but in doing so some acid had been used which, while cleaning the statue, made the last state worse than the first, as the acid got into the block and ate away the surface. In both the marble statues the condition is such that the only remedy is to recut and rechisel the whole. In that way a new surface will be got, and what will be required in future will be to subject the statues to periodical cleanings without, of course, using anything of an acid. Several other monuments, notably the Burns statue, is said to be in a very bad condition. It was agreed by the sub-committee to have the report printed for circulation among the members of committee, along with the recommendation that what is proposed should be carried into effect.

BEVERLEY MINSTER.

THE annual meeting of the East Riding Antiquarian Society was held last week at Beverley. Mr. John Bilson, F.S.A., gave some details as to the architectural history of the church, commencing from the period when the Minster was a missionary settlement, and the parish divided into districts attached to the various altars. St. Mary's was a chapel for which the canon of St. Martin's altar was responsible, and served even at that date the residential portion of the town. The first building of the chapel was attributed to Thurstan, Archbishop of York, in the second quarter of the century, and the earliest remains could certainly be very well dated in Thurstan's time. In one respect the building was in strong contrast to the Minster, which was commenced according to a consistent design, the harmony of which was maintained by successive architects. But St. Mary's had been enlarged and altered until there was very little indeed of the first building left, although that first building had had a very marked influence in everything that followed it. The first church appeared to have had a nave of the same width as now existing—of the length he could say nothing—and a square-ended chancel over 50 feet in length, with a tower between the two. Of that church there remained some fragments on the south aisle of the choir, including portions of the plinth of the original south wall and remains of buttresses. Towards the end of the twelfth century transepts appeared to have been added on either side of the tower, and as they were not square with the axis of the remainder of the church it was probably not cruciform. Mr. Bilson traced the growth of the church through the centuries, and said there was distinct evidence in the character of the masonry that the walls were formerly lower than at present. The north chapel was perhaps the most beautiful piece of work in the church. It was the design of a single man, whilst

all the other work had been hampered by the fact that it had been in the nature of a series of alterations rather than reconstruction. There was a legend that this was a Flemish chapel, but the story seemed to be entirely modern and erroneous. He saw photographs of "the Flemish room" over the north aisle of the chancel for sale, so he supposed the idea would stick. The flowing tracery from Flanders actually came to the Flemish people from France, which country was itself later than England in this form of decoration. A gap was caused by the Black Death, when all work was suspended, and when a restart was made towards the end of the fourteenth century another set of works was undertaken which had no connection with those which had gone before—the addition of a clerestory and the reconstruction of the west end. This was about the end of the fourteenth or the beginning of the fifteenth century, and the west front belonged to that date, with the exception of the two windows at the end of the aisles. Next came the addition of a similar clerestory to the chancel, with the tracery a little less severe, whilst it was even freer in the transepts, which were later still. This alteration involved the construction of the great east window. By 1460 the building was practically complete as now seen, but about 1520 the central tower fell over the nave, killing a good many people, and it was reconstructed during the next few years, Cardinal Wolsey giving 200*l.* towards this reconstruction.

At the conclusion of Mr. Bilson's historical summary the party made a tour of the church and discussed some of the chief features in more detail. The thanks of the Society were given to Mr. Bilson for the lucid way in which he had put before them the chief points of interest in the building.

GLASGOW INSTITUTE OF MEASURERS.

THE twenty-sixth annual meeting of the Institute was held on Monday in the Building Trades' Exchange. Mr. John Baxter, president, was chairman. The annual report of the Council stated that the membership now stood at seventy-four, besides one honorary member. Suitable reference was made to the loss sustained through the deaths of Mr. Robert Scott and Mr. John Dansken, both of whom were original members, and had from the inception of the Institute taken an active part in its affairs, and had rendered most valuable service in the offices which they had held. Each of them had discharged the duties of president for two years. Mr. Scott had also acted as secretary and treasurer for five years. It was reported that the examinations qualifying for membership were held in March last. Four candidates received the certificate in the preliminary examination, and five had received the certificate in the final and their names placed on the register of associates. It was also reported that the authorities of the Technical College had so far met the views of the Council in respect of the course of study in building construction by providing a much more extended course in that subject this session, and which the Council hoped to see still further improved. A grant of 2*l.* 2*s.* was again made for prizes in these classes. The treasurer's statement showed the funds to amount to 623*l.* 7*s.* 7*d.* The office-bearers for the ensuing year are as follow:—President, Mr. John Baxter; vice-president, Mr. George B. Walker; secretary and treasurer, Mr. Thomas N. Hill, F.S.I.; auditors of professional accounts, Messrs. Anthony Purdie and John S. Stewart; other members of Council, Messrs. Colin Young, John Currie, Alexander Davie, James Smellie, James D. Herbertson, John H. Allan and John Fyfe.

TESSERÆ.

Ancient and Modern Decoration.

IN England we colour the walls and leave the ceilings white; the Greeks, on the contrary, seem to have coloured the ceiling and left the walls white; and still in their houses we may see whitewashed plaster walls and painted wooden ceilings. Whether painted or carved there is a marked difference between the ornamental style of the Greeks and Romans. The former made their ornaments much smaller in proportion to the building than the latter, and there is a degree of simplicity and elegance of design and a neatness and delicacy of execution in Greek buildings which you would seek for in vain in Italy; while, on the other hand, in the Roman edifices there is a full and rich magnificence which is not to be found in those of Greece. The beauty of both is that the same feeling is observed throughout, and that in each building all the parts are in perfect harmony,

while in modern structures it frequently happens that one beauty is copied from one ancient building and another from another, and their union only produces disgust. This difference of character was preserved, though perhaps in a less degree, even to the latest times of Grecian art; and at Rome there are one or two buildings which exhibit indications of Greek taste, and have been supposed on that account to be the production of Greek artists.

The Castle of Tangier.

The castle externally appears almost as ruinous as the fortification, but is, nevertheless, used as the residence of the Governor when at Tangier. On entering the visitor is astonished to find the apartments in such good repair, belying their outward promise. One is astounded, after scrambling over broken walls and through heaps of lime and rubbish, to be conducted into elegant and tasteful apartments, adorned with all the beautiful and fantastic ornaments peculiar to Moorish architecture. In the centre of the building there is, as usual, a large open quadrangle, surrounded by an elegant colonnade of white marble. The pillars are of the slender and graceful proportions so much admired in Moorish buildings and their capitals fantastic and varied, but all bearing a resemblance to the Corinthian. The apartments on both storeys are small, but a great portion of their gaudy and glittering but most tasteful decorations is entire. The vaulted roofs, richly ornamented and embossed, and painted in various brilliant colours, are in perfect preservation. Much of the ancient parti-coloured glazed tiling also remains and the delicate tracery of the lacework on the walls is uninjured, except by whitewash. In fact, the castle of Tangier, in the style of its decorations, is the counterpart of the Alcazar of Seville, perhaps more perfect in respect of the ornamental part, but possessing no such elegantly proportioned apartments, and especially nothing at all comparable to the noble Hall of the Ambassadors.

The Two Goldstones.

Thomas Goldstone, the prior, who died in 1468, built a Dean's Chapel, Canterbury Cathedral. He also built the south-west tower and porch, and the Virgin Chapel now called the Dean's Chapel, which, though small, is one of the most beautiful examples of the unparalleled elegance of what the Pointed style of architecture is susceptible of in the kingdom. It was built before 1449. In 1468 Goldstone was buried in his own chapel, though the immediate spot of his interment is not known. The vaulting of the roof is highly decorated by tracery and fanwork, most excellently wrought and in very fine taste. The east window is also peculiarly elegant, and has among the mouldings a line of oak and vine-leaves terminating in canopied niches of rich pattern. All the other parts of the interior are very beautiful, though parts are destroyed and obscured by tombs. Thomas Goldstone, the second of that name, also prior of Canterbury Cathedral, who died in 1517, in conjunction with Prior Selling between 1472 and 1517, and aided by Bishop Merton, raised the centre or Bell Harry Tower (formerly the Angel Steeple) about 1515. Agreeable to the taste of that age rebuses or hieroglyphics of Goldstone and Merton still appear in this work: the former, three gilded stones, and the latter, mer and a tun. He also built the south-west gate, denominated Christ's Church gate, which Sumner calls "a goodly, strong and beautiful structure, and of excellent artifice." It was built in 1517, as an inscription on it formerly showed. This inscription was on a string-course or cornice on the south front, and extended the whole width of the building; it was, "Hoc opus constructum est an. Dom. millesimo quingentesimo decimo septimo." The whole southern exterior of this building is covered with tracery, panels, niches, canopies, shields of arms, among which are the arms of the see and those of Archbishop Juxon, with various sculptures.

The Parks and Galleries Committee of the Glasgow Corporation have resolved to purchase *The Light of Afternoon* by Sir Francis Powell, at present being exhibited in the Institute Galleries, Sauchiehall Street. Sir F. Powell is president of the Royal Scottish Society of Painters in Water-Colours.

Mr. George Marples, Associate of the Royal College of Art, London, and head-master of the Huddersfield School of Art, has been appointed head-master of the Hull Municipal School of Art. Mr. Marples was originally a student at the Derby Municipal School of Art.

NOTES AND COMMENTS.

A FEW months ago we mentioned that Prince ALBERT OF MONACO had proposed to open an Oceanographic Institute near the Sorbonne in Paris, and that the offer had been accepted by the French Government. *L'Art* gives a description and illustrations of the museum which Prince ALBERT has had erected in Monaco. If there is any country in the world where studies relating to the ocean should be in favour it is in Great Britain, and it is to be hoped that some of our millionaires will one day have the courage to follow the example of Prince ALBERT, and to erect a building like the Institut which will soon be seen in Paris. M. PAUL LEROI, the editor, contributes the first part of an article on his late contributor, or as he calls him, "notre doyen," PHILIBERT AUDEBRAND, to whose death we recently referred. There is also a biographical notice of the late ALFRED STEVENS, the Belgian painter, which is written with ample knowledge, and calls attention to the absence of the Under-Secretary of State for Fine Arts at STEVENS'S funeral. Readers of *L'Art* will be glad to realise that M. PAUL LEROI, after his long and dangerous illness, has resumed his trenchant criticism on the last Salon. He does not spare the jury for failing to recognise the merits of Mr. W. GOSCOMBE JOHN, who had contributed a copy of his statue of the late Duke of DEVONSHIRE.

An exhibition which is now open in the Birmingham Art Gallery is likely to create an interest in DAVID LUCAS, a mezzotint engraver who is now almost unknown. He was a pupil of W. S. REYNOLDS, under whom he served for seven years. When he was about twenty-six he became acquainted with CONSTABLE, and there can be no doubt he was an admirable interpreter of the landscapist. This is evident from the opinion which CONSTABLE expressed when he wrote:—"His great urbanity and integrity are only equalled by his skill as an engraver, and the scenes now transmitted by his hand are such as I have ever preferred. For the most part they are those with which I have the strongest associations, those of my earliest years, when 'in the cheerful morn of life I looked to nature with unceasing joy.'" In 1830 he commenced the publication of the English Landscape series, and twenty-two plates were offered for five guineas. It could not be considered a financial success, but he began a second series to which the public were indifferent. The original impressions are now sought after and are costly. But those taken from plates after they had been neglected are of little value. CONSTABLE was thinking of TURNER'S collection of plates when he proposed to bring out the copies of his works by LUCAS, in order "to increase the interest in rural England; its professional purpose, to mark the influence of light and shade upon landscape, and to give one brief moment, caught from fleeting Time, to lasting and sober existence." How plates of such value could be slighted will be hereafter considered one of the puzzles of amateurism. LUCAS made various efforts to win patronage. But they were all alike unsuccessful, and it is believed that he died in the Fulham workhouse. As has happened in other cases, his name may still become renowned. Mr. G. P. ROBINSON says he was handicapped through working on steel plates, which were introduced in 1823. Ink does not adhere to steel in the same way as to copper, and owing to its hardness the rocking-tool raises less burr.

GEORGE WASHINGTON was a modest man, as became an excellent land surveyor, and he could never, in his wildest dreams, have anticipated that a statue of him would one day be erected in Buda-Pesth. He may not have even heard of the city, for Prague in the eighteenth century was assumed to be of greater importance. It is also curious that on the pedestal the inscription should be on one side in English and on the other in

Magyar speech. It runs, "To the memory of WASHINGTON. The Hungarians of America, 1906." The sculptor is Herr JULIUS BEZEREDI. He has studied the biography of WASHINGTON, and has endeavoured to express the character of the general and statesman. For clothing and the manner of dressing the hair the sculptor has followed contemporary portraits. The figure rests the right hand on a strong walking-stick; in his left he holds a backwoodsman's hat, and on the arm is a cloak. In other words, the simplicity of the organiser of the United States is expressed. Beneath is introduced the symbol of the turul with outstretched wings, the fabulous bird which is supposed to have guided the ancient Magyars in the emigration from Asia, and in its claws it holds a sword.

THE theory of heredity finds support in the history of the BEGAS family. KARL BEGAS, who was the favourite painter of FREDERICK WILLIAM III. of Prussia, was born in 1794. After a training in Germany he studied under Baron GROS in Paris, and gained a reputation among his countrymen by his paintings of scenes from the Scriptures, some of which were of colossal dimensions. Herr REINHOLD BEGAS, the sculptor, is one of the sons of the painter, and was born in 1831. An exhibition of models of his works and studies is now open in Berlin. He has been fortunate in obtaining the most important of the public commissions during the last thirty years, the climax being reached in the memorial of the Emperor WILLIAM in Berlin. Four sons in all of KARL BEGAS became artists; two are painters and two sculptors. His grandson has also shown a tendency towards art, and it may therefore be assumed that for some time to come the family will uphold the reputation of the painter, and prove he was wise when he abandoned law for art.

THE Board of Governors of the Manchester Royal Infirmary resolved on Tuesday that a third storey be added to the surgical and medical block of the new hospital buildings in Stanley Grove. This extension will cost 22,000*l.*, exclusive of surveyor's and architect's commission and furnishing, and it will provide 108 more beds at a cost of about 200*l.* per bed. A return was prepared for the meeting, from which it appears that the number of beds in general hospitals of various towns is as follows:—Leeds, 436; Liverpool, 841; Birmingham, 478; Glasgow, 1,218; Belfast, 300; Manchester and Salford, 841 (on the basis of 598 beds in the new infirmary). The original plans showed accommodation for 598 beds.

THE sessional meetings of the Liverpool Architectural Society will begin on Monday next, the 8th inst., when the opening address by the president, Mr. EDMUND KIRBY, will be given. At the succeeding fortnightly meetings the following papers will be read:—"Old English Customs and Folk Lore," by Mr. PETER COWELL (city librarian); "Fenestration; or, the Treatment of the Window Openings in relation to the Structure," by Mr. WALTER CAVE; "Some Thoughts and Hints for Young Quantity Surveyors," by Mr. H. L. BECKWITH; "The Art of Drawing," by Mr. T. RAFFLES DAVIDSON; "Style in Architectural Draughtsmanship," by Mr. STANLEY D. ADSHEAD; "Inexpensive Cottages," by Mr. GEOFFREY LUCAS; "Architecture and Craftsmanship," by Mr. REGINALD BLOMFIELD. Mr. JOHN BELCHER will also read a paper.

RICHMOND AND KEW.

TWO of the most interesting parts of suburban London were selected by the Surrey Archæological Society for an excursion on September 22. The arrangements were carried out under the direction of the honorary secretary, Mr. Montague S. Giuseppi, F.S.A., and no hitch occurred. The first building visited was the parish church of Richmond, a building which is unknown to many people who profess to be acquainted with the town.

Richmond Church.

Mr. Albert A. Barkas, the borough librarian, read a paper in the course of which he said that reference was made to the "Chapel of Shene" as early as 1339, but no records existed to show where it was located. The earliest notice of the present parish church was in a MS. account of some of the private expenses of Henry VII. (1485-1509), where was to be found an entry recording a gift of 5*l.* towards the building of the church. Of that structure, however, all that remained was the tower, and that had been so modernised by its flint covering and other alterations that little or no trace of its antiquity could be seen. Up to 1904 the Tudor chancel was in existence, but that interesting portion of the old church and the fine monuments located there were removed in that year, and the present erection substituted. The ancient building, which reached from the chancel to the tower, certainly did not exceed the width of the present chancel. As the increasing population of the village required it, additional accommodation had to be found, and the north and south aisles and the west gallery were added. Taking the church as a whole, there was nothing about it to render it a striking object of admiration, either to the architect or the antiquarian, but there were a goodly number of interesting monuments. There was a fine peal of eight bells in the old tower, which were placed there about 1680. The registers commenced February 26, 1583, and were, he believed, perfect from 1682, except the records of marriages from 1751-4. The most interesting entry, he thought, was that of March 20, 1681, which recorded the baptism of Hester, daughter of Edward Johnson, the "Stella" of Swift. The organ was erected in 1770, at the expense of George III. and Queen Charlotte, and was built by one Knight, who was recommended by the king himself. Amongst those who had sittings in the church might be mentioned the Duke of York, afterwards James II., Sir William Temple, the eminent statesman, the Prince and Princess of Wales, parents of George III., and Dr. Nicholas Brady, the eminent divine. The earliest monument in the church was unfortunately without a date, but Mr. Challenor Smith had been able to fix the date as 1591. It was to the memory of Robert Cotton, gentleman groom of the Privy Chamber to Queen Mary, and afterwards Yeoman of "the Removing Wardoppe of Bedds" to Queen Elizabeth. His eight children were represented on the brass tablet, with their parents kneeling. There was a mural monument to Walter Hickman (1617), one of the original vestrymen of Richmond. There were also monuments to Lady Margaret Chudleigh, daughter of Sir William Courtney, of Powderham, near Exeter (1628), Lady Dorothy Wright (1631), Margaret Jay (1646), and John Bentley, his wife Ellenor, and their only daughter Ellenor (1656-60), the Hon. Barbara Lowther, "sister of the Earl of Lonsdale, the Countess of Darlington, and (Katherine) the late Duchess of Bolton" (1805). On the south wall was a bust and tablet to the memory of "Robert Lewis, Esq., a Cambro-Briton and a barrister-at-law," who died in 1649, not "from length of days, but from being such a studious lover of peace, that when a contention sprang up between life and death, he immediately yielded up his spirit to end the dispute." There was a mural tablet to Lord Viscount Brouncker (1687-8) of Castle Lyons, in Ireland, cofferer to Charles II. In 1678 Evelyn wrote that he dined at Mr. Henry Brouncker's "at ye Abbey of Sheene." His house was on part of the site of the old priory in what was called now the Old Deer Park. The burial-place of the poet Thomson was indicated by a small brass plate on the wall below the gallery at the west end of the north aisle. Sir Francis Chantrey, the sculptor, on seeing the bust to the memory of William Rowan (1767) spoke of it in terms of admiration, and stated that it was a very highly-finished piece of work. Up to the time of the removal of the old chancel a tablet might have been seen near the communion rails recording the burial of Mary Ann Yates (1787), the celebrated actress, and her husband, Richard Yates (1796), a comedian of great talent. It was said that Mr. Yates "died (very rich) of passion in consequence of dis-

appointment of his dinner." The first monument to their memory was considered of too theatrical a character, and was not allowed to be placed on the walls. On the north wall was a cenotaph erected by his grateful pupils to the memory of the Rev. Robert Mark Delfosse, LL.B. (1819), a minister of Petersham (who kept an academy of much repute on Richmond Green). A tablet of white marble was erected to the memory of Edmund Kean (1833), who died at his residence adjoining the old Richmond Theatre. Amongst the burials in the churchyard might be mentioned Mrs. Barbara Hofland, authoress of many instructive tales, and the wife of T. C. Hofland, the painter and author of "The British Angler's Manual" (1844); Richard, Viscount Fitzwilliam, who lived on Richmond Green (1816); Dr. John Moore, the father of the brave General Sir John Moore (1802); Joseph Taylor, who, when a young man, was instructed by Shakespeare to play some of his most celebrated characters, and who in 1614 was manager of a company of comedians at Richmond (1652). Heidegger was a person of much note who was Master of the Revels to George I. He lived at 4 Maid of Honour Row, and had the reputation of being the ugliest man of his day; James Fearon, an actor, who after performing at Covent Garden, often walked home to his residence at Richmond (1789); Jacques Mallet du Pan, a citizen of Geneva (1800); Right Hon. Lady Diana Beauclerk, wife of the Hon. Topham Beauclerk, the friend of Dr. Johnson (1808); and last, but not least, the tomb in the south churchyard of John Lewis, who died in 1792, aged seventy-nine years. John Lewis was our village Hampden, who sturdily championed the people's rights and privileges respecting the right of way across Richmond Park. Mr. Tibballs, their present-day parish clerk, was believed to be a descendant of Lewis.

Afterwards the gateway of the old palace on the Green and Asgill House, which was built on a part of the site of the palace, were seen.

Richmond Palace.

Mr. J. B. Hilditch read a paper. In the course of it he said that no palace in the world has been associated with more important historical events and personages than Richmond, and the spot is hallowed by the memories of the sorrows as well as the ambitions of the royal personages who have passed away, leaving no more trace behind them than there is of the buildings which once stood here. A royal residence existed on that site about the year 1125, when Henry I. occupied the manor house. Subsequently Edward II. frequently resided there and founded a convent of Carmelite Friars, from which the adjacent Friars Lane derived its name. Edward II., his grandson, Richard II. and Henry VII., all occupied the palace for longer or shorter periods, the last-named changing the name of the manor from Sheen to that of Richmond. In consequence of the palace having been partially destroyed by fire about 1497, he rebuilt it with still greater splendour. He died there in 1509, and then the palace became the residence of his son, Henry VIII., during the early part of his reign. About the year 1524 Cardinal Wolsey was bringing to completion his beautiful palace of Hampton Court, which on account of its exceeding in architectural appearance the royal one at Richmond, excited the envy of the king. Wolsey was afterwards permitted to reside at his pleasure in his manor of Richmond, and in the winter of 1525, as the plague was raging in London, Wolsey kept Christmas here in great state. It was Richmond Lodge, in the Old Deer Park, and not the palace, that was afterwards awarded to Wolsey for a residence in his disgrace. Edward VI. spent much of his time at Richmond, and the Princess Mary frequently visited her brother, and was staying at the palace when the Wyatt rebellion broke out. During the reign of Queen Mary her illustrious sister Elizabeth was for some time imprisoned in Richmond Palace, which she afterwards used as a royal residence, and finally ended her days within its walls. According to tradition she died in a room over the gateway. In 1587 the death warrant of Mary, Queen of Scots, was signed by her at Richmond. After the death of Elizabeth the palace lost its attractions as a royal residence, and Windsor came into favour. Prince Henry, eldest son of James I., however, resided here, and died in 1612, mourned by the whole nation, and more particularly by the inhabitants of Richmond. Three years later the palace became the abode of Prince Charles, who made himself unpopular by forming the great park for hunting.

After the death of the king in 1649 Parliament passed an Act that all the royal palaces should be sold, the blow

falling with much severity on the people of Richmond. "A fair yew tree," which the Commissioners valued at 10*l.*, was interesting, as it was to be seen standing in the garden of Wardrobe Court until about twelve years ago, when it was cut down. The whole property, with the Wardrobe buildings (the only portion of the palace still remaining), was sold for 10,000*l.* to Thomas Rookesby, William Goodwin and Adam Baynes, from whom it passed to Sir Gregory Norton, and was reclaimed at the Restoration. Many years after the palace had fallen into decay Richmond again became a resort of royalty in the person of the Prince of Wales (afterwards George II.), who took up his abode at Richmond Lodge in the Old Deer Park, the site being close to where the Observatory now stands.

The paper was illustrated by means of copies of drawings in the Bodleian Library and several old engravings.

The next building visited was the Trumpeting House, which derives its name from two figures of boys in the garden. Wardrobe Court and the old Palace House were also seen.

On reaching Kew Green the members went to the Dutch House, or Kew Palace, near the entrance to the Gardens.

Kew Palaces.

Mr. W. L. Rutton, F.S.A., read a paper on "The Palaces of Kew," viz. Richmond Lodge, Kew House, the Castellated Palace and the Dutch House. The last covered the site of a mansion called the Dairy House, which in 1553 belonged to Sir Henry Gate, and afterwards to Robert Dudley, Earl of Leicester, Queen Elizabeth's favourite, who died in 1588. The Dairy House was sold to a Dutch merchant, Samuel Fortrey, who pulled down the old mansion and built on the site of it the house that yet exists. It was transferred to royal hands about 1730, when Queen Caroline acquired a long lease of this and another house not now existing. The first royal occupant of the Dutch House was Anne, Princess Royal, who in 1734 married the Prince of Orange. Afterwards two other daughters of George II. had it, viz. the Princesses Amelia and Caroline, the former probably vacating the house in 1751, when she was made Ranger of Richmond Park, where she had her lodge. In 1754 George, Prince of Wales, occupied it, and it was there that he received the announcement of his accession to the throne as George III. In 1773 it was apportioned to the two eldest boys, the Prince of Wales and Duke of York, and here they were educated. The king was removed here in the spring of 1801, when the return of his mental disorder necessitated temporary separation from his family residing at Kew House.

The house may be said to have become a palace on September 23, 1802, when for the first time the king and queen, with their daughters, took up their abode in it. The last family visit to the house was made in October 1805, when they stayed a full month, and the king's last visit occurred in January 1806 as he passed from Windsor to London. Again in July 1815 it was recorded that Queen Charlotte passed a fortnight at Kew Palace, whither she came to die in 1818. Suffering much, but resolved to witness the marriages of her two sons, the Dukes of Clarence and Kent, which took place in the drawing-room on July 11, the queen lingered for five months and died in November.

The old palace was doubtless visited from time to time by her children, who were attached to it, and none more than King William IV. In the next reign the contents of the residence were gradually removed, and in 1883, when the low range of buildings adjoining the mansion on the west side were taken down, the apartments were entirely denuded. Finally, the late Queen Victoria in 1897, the year of her Diamond Jubilee, yielded the old palace to the natural curiosity of her subjects. It was then cleaned up and put in order, and the few articles of furniture they now saw, with the pictures and sundry old-fashioned memorials, were arranged in it. The mansion presents a fair specimen of the Jacobean type. The elevation is perhaps somewhat formal and monotonous, but there is the relief of deep moulded string-courses dividing the storeys, and of delicate pilasters with capitals flanking the door. The three gables with attic lights and the groups of chimney-shafts, though plain, are characteristic. Internally the sparse ornamentation and the panelling is also Jacobean, but there is an exception in one small room which has Tudor—linen pattern—wainscoting, and this is extremely interesting as being in all probability a relic of the Dairy House. A small fireplace on the second floor seems also to be a Tudor relic, but the most important

remnant is the groined and ribbed crypt which underlies part of the mansion, and which is believed to witness to the house of the Earl of Leicester and perhaps of yet earlier occupants.

After the palace and crypt had been inspected the excursion came to an end.

MODERN ANTIQUITY.*

IN perusing our volumes of Transactions it is fairly evident that, at any rate, so far as the published matter is concerned, the East Riding Antiquarian Society devotes most of its attention to the study of ecclesiastical and architectural antiquities, to family history and to matters which are perhaps as well described by the word *archæology* as anything. Under the last head I refer to the papers dealing with excavations on British and Roman sites, and to finds dating back to very early times. The paper which I had the honour of reading to this Society two or three years ago endeavoured to deal fairly exhaustively with all the various archæological discoveries which have been made in the east of Yorkshire. Since then one or two finds of importance have come to light, which I propose to briefly refer to, and thus supplement my previous notes; but it occurred to me that there was one branch of antiquities which has been sadly neglected by this Association. On being asked, therefore, by our secretary to send some notes to you this evening, I thought I could not do better than make a few remarks upon some objects which, though having no very great age, still claim our attention from the fact that they are relics of the past, and have as much bearing on the domestic and general history of the district as have a Roman pavement or a British tumulus.

In connection with our museum at Hull, I have for many years endeavoured to gather together a series of objects illustrating what might fitly be called our grandfathers' days. Some of these I propose to bring under your notice, and to many of the members present it is quite possible that most of the objects may be familiar. But speaking as one who has not had the advantage of as yet residing on this planet for thirty years, I must say that until recently most of the objects I am describing were to me very unfamiliar, and difficult as it has been for me to gather these odds and ends together, it is obvious that future generations will find it still more difficult to obtain them. In accumulating, therefore, what some of my older friends may at times refer to as "rubbish," I do so in the firm belief that in the future, at any rate, the collections will be properly appreciated. I can only say that if this kind of rubbish had only been accumulated in the museum at Hull during the past sixty or seventy years, we should have a much more valuable collection than we possess.

Strangely enough, as already hinted, it is the common objects of one generation which seem so difficult to obtain by the succeeding generation. Take, for example, the well-known farm implement the flail, which consisted of two pieces of wood, a long and a short one, fastened together by a thong, and was used for thrashing corn by hand in days preceding the thrashing-machine. We were a considerable time before we could obtain a single specimen. Dozens of people told us that they knew where there were several, but on inquiry being made it was found that flails had been used as broom-handles, had been chopped up for firewood or had been destroyed in other ways. So soon as machinery made the hand flail useless it was thrown aside and rarely cared for. As it happens, we have now obtained quite an interesting series of these implements illustrating the various methods adopted for securing the shorter to the longer piece of wood, the joint at the elbow being made of iron, wood or thong. A search round an old farm building may easily result in some suitable objects being secured.

Of wood particularly quite a large number of utensils and weapons were made. Large spoons and basins, tinder-boxes, nut-crackers, cheese moulds, &c., all of wood, may now and then be secured. I have not yet been successful in securing a wooden platter, yet there were many of these in every house in the Riding. Some of them were merely turned in the form and shape of an ordinary dinner plate. A more interesting form, however, consisted of a squared piece of wood, with a large depression in the centre for the food and a smaller depression in one corner for salt. The

* A paper read by Mr. T. Sheppard, F.G.S., Curator of the Hull Museum, at the annual meeting of the East Riding Antiquarian Society.

introduction of cheap pots has apparently resulted in these wooden platters being practically completely destroyed, though I have frequently met with people who remembered them being used. Another common household article was the hand mangle, generally in oak or other hard wood, which consisted of a roller around which the linen was wrapped and a battledore used for pressing the roller in moving it forward on the table. In a farmyard outhouse one may occasionally meet with many curious agricultural implements, such as dibbling-irons, for making holes for setting beans; fothering irons, resembling a grate with a handle, used for detaching the horns from barley. There may yet exist a hand winnower, used for separating the chaff from the corn after it has been thrashed. I have not yet succeeded in obtaining one, but they consisted of pieces of canvas and other material tightly drawn across a roller, somewhat after the manner of the paddles on the wheel of a paddle boat. The roller was held in position on two supports, and by means of the handle was quickly revolved. Another object consisted of a squared piece of wood with a handle, which was smeared with grease and sprinkled with sand, and used for sharpening scythes, &c., before the present familiar hone was in use. The old-fashioned form of sickle and shepherd's crook are rarely met with. Other objects going out of use and worth preserving are the Dutch hoes, hand churns, cheese moulds (sometimes curiously carved), cheese presses, horn lanterns, "bag markers," primitive forms of scarecrows made of wood or wood and tin, &c. We have a very fine cheese press with a wooden screw, the weight being formed from a squared stone from Thornton Abbey.

"Beware of spring guns and mantraps" was a not unfamiliar sign in orchards, &c., half a century ago. Whilst we have managed to secure one or two interesting, and anything but humane, mantraps and spring guns, I still have to obtain one of the painted signboards which, I am afraid, have been painted over, and now read "Trespassers will be Prosecuted," or "Private Road," notices which are becoming far too familiar.
